The best practice is to handle items of this kind as deferred charges under suitable descriptive caption, instead of as charges direct to the asset account where the nature of the items is soon lost from view and the need of a high depreciation rate to write them off is soon forgotten. Thus, a rearrangement of the machinery in a plant may bring about a more economical routing of the product, or the introduction of a new machine may entail an entirely changed disposition of existing machines—all for the purpose of, and actually accomplishing, a saving in costs. Rather than a charge of the costs incurred to the asset account Machinery, a setting of them up under the title “Rearrangement Costs of Machinery,” or other similar title, shows their exact status and makes possible an intelligent writing down of them periodically in accordance with the estimated life or continuance of the savings effected. Practically this amounts to treating the costs as capital expenditures if the saving effected is judged applicable to more than the current period. The chief difference is that booking such items as deferred charges calls for specific attention to the need of a speedy writing off.

Asset Subject to Depreciation a Deferred Charge to Operations

In this connection it may be pointed out that the cost of all assets subject to depreciation may well be looked upon as deferred charges to operation, some portion of that cost being charged off at the close of each fiscal period. “So we see that capital expenditures, as distinguished from expenses, are at last an arbitrary conception. It begins with the idea that certain expenditures have an efficiency which reaches over many earning periods extending indefinitely into the future. But nothing physical would last so long, and its earning power might have even less permanence. To meet this condition we arbitrarily designate certain expenditures whose effect indefinitely outlasts the immediate earning period as ‘capital,’ and then in the same arbitrary way, through all subsequent vicissitudes, we hold them to their first value by maintenance, renewal, and depreciation charges which are borne by other expenses.”[13]

[13] “Handbook of Railroad Expenses,” by J. S. Eaton.

Authorization for Booking Capital Expenditures

As regards a suitable method for handling transactions which involve a separation into capital and revenue charges or a determination of the status of the transaction as between capital and revenue, proper authority should be secured for making the expenditure. Where possible, before its incurrence, authorization as to its proper booking should be given, even to the amounts where feasible, and this order becomes thus the voucher supporting the entries on the books.

Repairs on Second-Hand Plant

In one situation repair charges which are ordinarily an expense must be capitalized. Where a company takes over a plant which is badly run down and out of repair, the expenditures necessary to bring it to a state of efficient operation are capital expenditures. Such a plant resembles a partially completed plant, and the purchase price is supposed to take that fact into consideration. It is expected that additional capital will have to be sunk to rehabilitate the property and put it in a condition of repair necessary to earn revenue. Accordingly the expenditures necessary to do this are rightly treated as capital charges.

Construction Costs

A final consideration in the distinction between capital and revenue expenditures has to do with certain costs incurred during the period of original construction. We may cover the situation by a general statement to the effect that all costs necessary to produce a complete plant in condition ready to earn revenue are proper charges against capital. Thus, interest on moneys borrowed for construction purposes is a proper charge to capital, and in England it has been held that dividends in the form of interest are allowable to _shareholders_ during the construction period. Also, such items as engineering and superintendence, law expenditures, injuries, taxes, etc., both preliminary to the construction period and during it, are to be capitalized. On the other hand, profits on own construction work are never to be counted as costs. To do so reveals a misunderstanding of the difference between a profit and a saving. The matter is discussed more at length elsewhere.

As to whether any portion of the overhead expenses has a rightful place among the assets must be determined by the conditions in each case. In original construction work, before operations begin, all overhead charges constitute a part of the cost of the assets. For betterment work and additions carried on concurrently with operation, the case is not so clear. A safe principle is to treat as capital charges all increases in overhead above what would normally have been incurred for operation only. To free operation of any portion of the _regular_ overhead just because betterments are in progress is not recognized as a sound or conservative policy.

Distinction between Capital and Revenue Expenditures often Based on Opinion

Thus it is seen that many phases of the problem of capital and revenue expenditures are extremely difficult of determination and in their final analysis rest on estimates and opinions rather than definitely established facts. Too often it is feared that decision in matters of this kind is “influenced by unsuspected individual caprice and by considerations of the financial convenience of the moment”; for the allocation of such items may sometimes represent the margin between a profit or a loss for the current period. As is said to be true of geometry, so here there is no royal highway to the solution of these problems.

Main Groups of Asset Items

If, therefore, it can be determined what items are to be included in the balance sheet and the proper basis for their valuation can be established, the problem as to its content is well on the way to solution. Having discussed the elements and factors entering into a determination of cost value, we are in a position to state the principles of valuation applicable to the main groups of items as set up in the balance sheet. These may be listed, for the purpose of this generalization, under three heads, viz.: (1) current assets, (2) deferred charges to operation, and (3) fixed assets.

1. For the current assets, the principle of valuation may be stated as valuation on the basis of cost or market, whichever is the lower. Since speedy realization of the current assets by conversion into cash for its equivalent is the aim and expectation of every business—for on such conversion depends the ability to meet the current liabilities and so have working capital available for another cycle of purchase and sale (another turnover)—it would seem that the realization price as given by the market should govern. In the interest of conservatism and as producing certain other desirable results which will be brought out as each asset is examined in detail, cost price, if lower than market, is deemed the desirable basis for the valuation of this group. By way of explanation, it should be said that working capital as used here is the difference between current assets and current liabilities and so represents the portion free to be put to the further pursuit of business.

2. The principle of valuation involved in deferred charges to operation is simply the principle of equitable prorating between periods on the basis of a going concern. Here, not sale value, cash surrender value, or forced sale value govern, but their value to a concern which expects to continue operations.

3. For the fixed assets, the principle of valuation generally applicable may be stated as valuation on the basis of cost less depreciation. This group of assets represents the properties held for operating and without which operation could not continue. They are the very essence of the enterprise. Disposal of them would mean abandonment of the undertaking. Hence they are not held for realization and conversion into cash, and in a going concern market value has no effect on them. To a going concern they are worth at any time what they cost less the portion used up in operations to date. Therefore valuation at cost less depreciation is the proper basis for showing the fixed assets in the balance sheet.

Valuation of Liability Items

To the liability items of the balance sheet, principles of valuation are not directly applicable as such, except so far as content or inclusion and measure of quantity or amount may be said to embody considerations of valuation.

Over- and Under-Valuation

The need for correct valuations requires no comment and can best be appreciated as compared with the effects of over- and undervaluations. Particularly bad and harmful is overvaluation of the assets and undervaluation of the liabilities. The use of the balance sheet as an index of financial condition makes apparent the harm of wrongful content or valuation of the items entering into it.

The Balance Sheet an Expression of Opinion

It is thus seen that the main problem in connection with the presentation of a true balance sheet is a problem in valuation and content rather than form. From what has been said it will be evident that valuation in the vast majority of cases is not an exact science—a process of definite determination. Rather, from the nature of the data to be handled and the principles of valuation given as applicable to the various groups of data, valuation must almost always be an estimate. The determination of the value of the elements of cost, the proper differentiation between capital and revenue charges, and finally the calculation of the amount of

depreciation necessary to the valuation of fixed assets—all are estimates. It is true, they are estimates based on experience, but, from their nature and the influence of local conditions in a given case, no universally applicable law of experience can be formulated. It is safe to say that two men would seldom, if ever, arrive at the same estimate of the values of given assets. Accordingly the conclusion is reached that a balance sheet is not a statement of fact but always an expression of opinion. If estimates are carefully made in the light of all available facts applicable thereto, the expression of opinion in the balance sheet will approximate as nearly as may be to a statement of fact.

Because depreciation plays so important a part in making these estimates, it seems necessary, before setting forth the detailed application of the principles of valuation to the various assets, to devote several chapters to a full discussion of the subject, chiefly as it is related to the problem of valuation but also in some of its correlated aspects.

CHAPTER VI

DEPRECIATION—ASPECTS AND DEFINITIONS OF TERMS

Aspects of Depreciation

Depreciation is intimately related to practically all problems of valuation. The engineering profession has made many valuable investigations and contributions to the literature of the subject and constant reference to them and use of some of their findings will here be made. Most of their studies relate to the vexed and still unsettled question of the valuation of public utility properties for the sake of its bearing on the problem of fair and equitable rates to the user or consumer. Accordingly much of this material is not applicable to the accounting phases of the subject. It is purposed here to treat the question from the standpoint of accounting rather than that of engineering.

Depreciation may be considered from many viewpoints. It is involved in the problem of rate-making referred to above; it must be considered in the valuation of fire insurance adjustments; it is bound up with most questions of taxation, with all transactions involving the purchase and sale of enterprises, with negotiations for the procuring of loans, for the determination of the limitation of capitalization; and in all studies of commercial balance sheets depreciation is found to affect the value of going concerns. As stated in Chapter V, these are not always separate and distinct problems of valuation; they may and often do overlap, one basis for valuation sometimes serving several of the purposes or classes named above. The treatment of the subject will be limited in this book to the latter phase of the subject, i.e., going concern valuation, with the object of establishing certain norms and differentiating this phase of depreciation clearly from its other relations.

Definitions

A clear-cut definition of depreciation is desirable. The word in a general sense means a lessening, a decrease in value; decretion; deterioration. Various specific definitions are given, among them being: “the loss, arising from years of service, in the value of the investment in perishable property”; “expired capital outlay.” These and many other similar definitions are met with.

The term “depreciation” is frequently used when the term “amortization” would be more appropriate. R. P. Bolton[14] says: “The subject of depreciation has been greatly misrepresented, because depreciation, which is a financial result, has been confused with obsolescence, which is an economic process, and with deterioration, which is a physical condition. Either of the latter brings about depreciation, and the physical process rarely happens to be more rapid than the economic.

“An illustration of the processes involved is that of the physical deterioration and obsolescence of a work horse, the capacity of which is definitely connected with its condition, and the value of the labor of which is discounted by its up-keep and the cost of its supplies and feed. Its age is productive of reduction of capacity, but this process may be, and often is, anticipated for commercial reasons by its supersession by some other form of apparatus. The horse may be in ever so good a condition at the time when the motor displaces it, but its financial depreciation then is complete, for it could be maintained only at a loss. All the elements which come into consideration in connection with machinery will be better understood if considered in relation to such an animal, the life of which may readily extend beyond the point at which its commercial value has terminated.”

[14] In “Power for Profit.”

Authoritative Opinions

The special committee appointed by the American Society of Civil Engineers for the purpose of formulating principles and methods for the valuation of railroad property and other public utilities, after a study of the question covering a five-year period, presented its report at the annual meeting of the society, January 17, 1917. The question of depreciation receives full and serious consideration in this report, which although treated mainly from the rate-making standpoint offers many suggestions for the valuation of commercial balance sheets. Their statement reads:

“Perhaps there is no single subject in connection with valuation that has caused more trouble than depreciation. This has been due to various causes, perhaps not the least of which has been confusion in the use of the term. Depreciation is sometimes used to mean decretion, which is loss of service life; sometimes to mean the money allowance made in the bookkeeping to offset accruing loss of service life; and sometimes the loss of value existing at any time due to the loss of service life or any other cause. The committee will use it only as meaning the loss of value or worth of property units which are parts of going concerns. Although this may be due to many causes, the general discussion will include consideration only of those effects which, like wear and tear, age, use, and obsolescence or inadequacy, bring a physical property unit gradually to the end of its service life.”

Earl A. Saliers[15] says: “This loss of value, whether tangible or intangible in form, resulting from physical decay, or from obsolescence or inadequacy, which indicate functional decay, is known as depreciation. It necessitates repairs, renewals, and replacements. Did it not occur, every outlay on plant would add to the investment. It does not result from one cause but from many causes, and this sometimes leads to the belief that it cannot be scientifically handled. But some adequate method of handling it is not merely desirable, but necessary, to a solution of the problems arising in the valuation of public utility properties, and in the management of industrial enterprises generally.”

Henry Floy[16] says: “It (depreciation) is used broadly to mean a reduction in utility value, expressed as a percentage but more usually in dollars, due to any deterioration in physical plant by reason of: (a) normal wear and tear, (b) age or physical decay, (c) inadequacy, (d) obsolescence, (e) deferred maintenance. The term depreciation, always used in connection with a reduction in value, has, however, four distinct and separate shades of meaning, so that the term must be qualified when used in order to distinguish which one of the following meanings is intended:

[15] In “Principles of Depreciation.”

[16] In “Value for Rate-Making.”

“First. The annual amount, expressed as a percentage or in dollars, that should be laid aside to renew or replace the article in question at the time of its abandonment.

“Second. The annual amount, expressed as a percentage or in dollars, that should be laid aside to renew or replace the article in question at the time of its abandonment, plus the annual expense of maintenance and repair expended in removing such part of depreciation as is practicable and good economy.

“Third. The total amount—usually that estimated as necessary to be expended to put the physical property in perfect operating condition—determined by the inspection and observation of an experienced engineer, expressed in a percentage or in dollars, which must be deducted from the ‘original cost’ or the ‘cost to reproduce new,’ in order to determine the absolute, actual, present value.

“Fourth. The total amount—it may be the sum of several years of depreciation—computed from ‘expectancy of life’ tables, more or less authoritative, expressed in a percentage or in dollars, that must be deducted from the ‘original cost’ or the ‘cost to reproduce new,’ in order to obtain the theoretical, present, depreciated value. This value may be increased or reduced by the condition of the property, as determined from inspection.”

The foregoing quotations from authoritative sources not only show the efforts made to define the term accurately, but also indicate the various elements included by different writers under the term, and suggest the need of further effort toward the standardization of its meaning.

Why the Depreciation Factor Arises

The distinction made in Chapter V between capital and revenue charges draws attention to the fact that the depreciation factor arises only because the fiscal or other period when information concerning values and costs, i.e., financial condition, is desired, does not coincide with the expiration of service life of the properties used in production. If the information just referred to were not

desired at intermediate periods between the date of acquisition of the asset and the date of its discard or obsolescence, its cost should be treated solely as an expense of operation to be charged to the whole period in the same way that the fuel consumed, the raw materials used, etc., are regarded as revenue charges, or costs of manufacture. Practically, therefore, depreciation must be considered because a statement of financial condition is needed at regular stages of the life of the enterprise; and furthermore because the life of the various assets used in an undertaking is not uniform in length and their life histories in consequence overlap. Some assets wear out and have to be replaced, while others have still many years of useful service in them.

Actual or Absolute Depreciation

Before considering the various elements of depreciation, an explanation of some related terms will be given. A distinction is sometimes made between “absolute or actual” and “theoretical” depreciation. Absolute depreciation is the decrease in value of an asset from its state when new, to its present condition _as viewed either from the standpoint of the amount it could be sold for_ or from the standpoint of its serviceability. In the first place, therefore, absolute depreciation is not applicable to going concern valuations. A machine after only a short term of service becomes, from the standpoint of its salability, a second-hand article and suffers a large decrease in _market_ value. A water-pipe or an underground telephone cable immediately after its installation and even before it is brought into service depreciates materially from the standpoint of its salability as a disconnected unit. But from the standpoint of service and operations, i.e., adaptability to its intended use, such an asset may really be more valuable than before or immediately after installation. Again, an asset because of the excellent state of repair in which it is maintained may, so far as the serviceability required of it is concerned, be practically as good as new from the date of its installation until well along towards the end of its life-term. Its actual or absolute decrease in value is very slight during the early years of its life but increases rapidly just before it is discarded. This fact is illustrated by the example of the water-pipe. Slight repairs, the replacement of parts and small units, keep it for a long period 100% efficient, but the time comes when it is completely worn out and repairs are no longer economically advisable. These two examples illustrate absolute or actual depreciation.

Theoretical Depreciation

Theoretical depreciation is based upon, and has reference to, _all_ the factors which must be considered in taking account of depreciation. As so considered the subject is viewed from the standpoint of financing the item of depreciation (sometimes called “accounting depreciation”) rather than from that of its serviceability. The engineer attempts to determine the actual, present serviceability of the asset in comparison with its serviceability when new, and so he leaves out of account its expectancy of life due to whatever causes.

Comparison of Actual and Theoretical Depreciation

The following chart adapted from Henry Floy’s “Value for Rate-Making” admirably illustrates the difference between actual and theoretical depreciation.

[Illustration: _Chart Showing Actual and Theoretical Depreciation_]

Curves 1, 2, and 6 representing actual depreciation have been sufficiently exemplified in the foregoing explanation of actual depreciation. Curves 1 and 2 may well represent the actual depreciation of two assets as viewed from the standpoint of salability; whereas curve 6 represents the actual depreciation of an asset viewed from the standpoint of serviceability, assuming that maintenance has kept the asset practically 100% efficient during most of its life-term. Curves 3, 4, and 5 are illustrations of _theoretical_ depreciation, the different curves representing different bases for calculating the annual amount of the decrease in value, as will be explained in Chapter IX, “Depreciation—Methods of Calculating.” To quote from Mr. Floy’s work at length:

“The curves 3, 4, and 5 indicate several classes of ‘theoretical’ depreciation which have been quite widely used in some cases for estimating present values, but more often for determining the yearly theoretical deterioration for purposes of establishing depreciation funds, which, however, is quite a different subject. Making a theoretical estimate of the probable, future, average, annually accruing deterioration of certain property to provide an item in bookkeeping accounts of operating expense has nothing whatever to do, in making an appraisal, with fixing the definite amount of absolute, actual, or accrued depreciation which depends upon the present condition of physical property, determinable from inspection and not upon historical documents, depreciation funds, or disputed theoretical conclusions.”

In an opinion filed March 8, 1916, by the Public Service Commission of Maryland in the matter of the Chesapeake and Potomac Telephone Company of Baltimore City, an interesting commentary on the relative merits of actual versus theoretical depreciation is made. While the opinion concerns primarily depreciation from the rate-making point of view, it shows well the interrelation between the two kinds and answers so conclusively the objection often raised to accounting depreciation that it is here quoted. The statement is:

“Any theory for ascertaining existing depreciation in the plant of a public utility which confines such depreciation solely to the actual, visible, physical, demonstrable deterioration which can be seen by the human eye and measured by the human hand, must of necessity ignore that other species of deterioration which the experience of the past has demonstrated beyond peradventure exists in the property of every telephone company, although it cannot always be seen by the human eye or measured by the human hand. We refer to that tendency upon the part of all such property to become inadequate or obsolete with the lapse of time.”

“Accounting” and “Fair” Depreciation

Another distinction is sometimes made between “accounting” depreciation, previously mentioned, and “fair” depreciation or depreciation of valuation. Accounting depreciation signifies the depreciation, determined by whatever method, which has been taken into the accounts, i.e., the depreciation as shown on the books. This is approximately the same as theoretical depreciation defined above. Its point of view is that of financing the loss of value caused by depreciation so as to cover the entire loss by the time the asset is retired from active service rather than that of establishing a true actual value of the asset at intermediate periods. On the other hand, fair depreciation or depreciation of valuation is the “sum that should be deducted from original cost to date (or from estimated cost of reproduction new)[17] as a step in finding that which the courts have called ‘fair value.’” Here the point of view is essentially that of showing the true value of the asset at a given date. Determination of this is fundamentally an engineering problem in the solution of which cognizance must be taken of:

[17] Material in parentheses is the author’s.

1. Accounting depreciation. 2. The managerial policy as to repairs, maintenance, and renewals. 3. The past performance and expected future performance of the asset. 4. All other factors locally present which may affect the determination of the _present_, existing values in the asset.

Under certain conditions fair depreciation corresponds roughly with actual or absolute depreciation as defined above.

Complete and Incomplete Depreciation

Depreciation is sometimes classed as “complete” and “incomplete.” Complete depreciation refers to those assets or properties which have been discarded because no longer capable of economical service. When their cycle comes to an end, depreciation is complete. Incomplete depreciation refers to the amount of the decrement in value of assets which are still in service. The accounting for complete depreciation requires little consideration except so far as _rates_ of depreciation are concerned. This class of depreciation represents the accomplished fact and therefore furnishes data and statistics by which the _expected_ depreciation of similar new assets can be calculated. The accountant, therefore, is concerned with it purely as an experimental means of forecasting the future.

Individual and Composite Depreciation

Again, depreciation is classed as “individual or unit” and “composite.” Unit depreciation is the amount of the decrease in value of the individual parts which compose the whole of a property; composite depreciation is the amount of the decrease in value of the plant or property as a whole. Its amount in dollars is the sum of all unit depreciations similarly expressed. Expressed as a percentage it represents the effect of all unit depreciations weighted by the ratio of the value of each to the whole. Thus a plant as a whole may be depreciated 20%, but the numerous units of that plant may have a range of depreciation of from 0% to 100%. Some items may be ready to be discarded and others will probably have just been newly installed.

In connection with composite depreciation the term “normal” or “average” value is used. The normal value of a plant is the average value at which it must be maintained to give efficient service. Any drop below that point results in increased cost per unit of service rendered, and is consequently evidence of poor management. Normal value may sometimes be expressed in percentage as the difference between 100%, original cost, and composite depreciation. In the case cited above, where composite depreciation is 20% the normal value would be 80%, under a proper policy of management.

Physical and Functional Depreciation

Finally depreciation is classed as “physical” and “functional,” definition of which are deferred for treatment in Chapter VII, “Depreciation—Its Causes.”

Deferred Maintenance and Accrued Depreciation

Other terms needing definition are: “deferred maintenance” and “accrued depreciation.” The former refers to repairs which at any given time are needed for the proper up-keep but which for one reason or another have not yet been made. So long as an asset is giving reasonably satisfactory service, repairs are usually deferred to a convenient time—such as when work is slack, or until similar repairs may have accrued elsewhere, or until weather conditions have changed, or in general until the repairs can be most economically done. Similarly, accrued depreciation refers to the depreciation which has taken place between the last time an item was brought on the books and the present time. The inevitable forces causing depreciation are constantly at work bringing about the decretion of the asset day by day, but it is impracticable to reflect such condition daily. Only at the close of each fiscal period is it deemed necessary to adjust the books so that they reflect the depreciation which has taken place during the period just closed.

Attitude of the Law

Before studying the factors of depreciation it is interesting to note the attitude of the courts towards depreciation. Accountants and engineers recognized the necessity of taking account of depreciation considerably in advance of its recognition by the courts of this country. H. R. Hatfield[18] says: “France, Belgium, Switzerland, Germany, Austria all prescribe in their statutes that depreciation must be reckoned before showing profits.” The French Joint-Stock Company Law specifically requires the reservation of some portion of the company’s surplus for taking care of the depreciation of the assets. While the method may not be scientific, the principle involved is recognized as correct. But in an early English case, Lee v. Neuchatel Company, it was held, in the case of a company operating inherently wasting assets “that even depreciation by waste is not necessarily a revenue charge.”

[18] In “Modern Accounting.”

Early decisions in this country likewise fail to sustain the propriety of depreciation charges. The cases usually cited are The Union Pacific R. R. Co. v. United States, 99 U. S. 402, and United States v. Kansas Pacific Ry. Co., 99 U. S. 455 (1878), the first not passing specifically on the question of depreciation but showing a lack of appreciation of the distinction between capital and revenue charges, and the latter stating that “only such expenditures as are actually made can with any propriety be claimed as a deduction from earnings.” The Supreme Court of California in San Diego Water Co. v. San Diego, 118 Cal. 556 (1897), and in Redlands, etc., Water Co. v. Redlands, 212 Cal. 312 (1898), refused all allowances for depreciation except necessary amounts for “maintenance and repairs during the year.” However, in Pioneer Tele, and Tele. Co. v. Westenhaver, 118 Pac. 354, the language of the court is not uncertain: “A sufficient sum should be allowed from the earnings of a utility to make good the depreciation of the plant and replace the deteriorated portions thereof, when they become so impaired that they can no longer be made useful by repair.”

Decision of Supreme Court

The United States Supreme Court recognizes the necessity for an allowance for depreciation in Mayor and Aldermen of the City of Knoxville, Appt., v. Knoxville Water Co., 212 U. S. 14 (1909), which forms the basis of judicial attitude towards the question at the present time. The decision of the court which has been supported and reaffirmed in all subsequent decisions, reads, in excerpts:

“A water plant with all its additions begins to depreciate in value from the moment of its use. Before coming to the question of profits at all the company is entitled to earn a sufficient sum annually to provide not only for current repairs, but for making good the depreciation and replacing the parts of the property when they come to the end of their life. The company is not bound to see its property gradually waste, without making provision out of earnings for its replacement. It is entitled to see that from _earnings_ the value of the property invested is kept unimpaired, so that, at the end of any given term of years, the original investment remains as it was at the beginning. It is not only the right of the company to make such a provision, but it is its duty to its bond- and stockholders, and in the case of a public service corporation, at least its plain duty to the public. If a different course were pursued, the only method of providing for replacement of property which has ceased to be useful would be the investment of new capital and the issue of new bonds and stock. This course would lead to a constantly increasing variance between present value and bond and stock capitalization—a tendency which would inevitably lead to disaster either to the stockholders or the public, or both.”

Recognition of the Depreciation Factor

Following this decision the rules and regulations of the public service commissions of practically all the states now require that provision for depreciation be made. In the case of some of the smaller public service companies the failure to make this provision is overlooked but the practice is generally recognized as absolutely necessary. The Interstate Commerce Commission has led in this respect, although its early rulings relative thereto were strenuously objected to in some quarters. Private concerns in their contact with the government now almost invariably see the value, or at any rate the self-interest, of a deduction for depreciation. In the case of the Special Excise Tax, a Treasury decision on account of Internal Revenue provides that “deduction on account of depreciation of property must be based on lifetime of property, its cost, value, and use, and _must be evidenced by a ledger entry_ and a like reduction in the plant and property account with respect to which depreciation is claimed.”

Similarly, the present Federal Income Tax Law recognizes allowances for depreciation, but perhaps errs in placing too stringent safeguards on the amounts to be deducted therefor, whereas the Federal Trade Commission realizes the need of liberal provision. The law reads: “That in computing net income in the case of a citizen or resident of the United States, for the purpose of the tax there shall be allowed as deduction a reasonable allowance for the exhaustion, wear and tear of property arising out of its use or employment in the business or trade. No deduction shall be allowed for any amount paid out for new buildings, permanent improvements, or betterments, made to increase the value of any property or estate, and no deduction shall be made for any amount of expense of restoring property or making good the exhaustion thereof for which an allowance is or has been made.” The depreciation allowed as a deduction from income must have actually been charged off the books. Many interesting rulings—some almost absurd if carried to their logical conclusions—have been made by inspectors and the Treasury Department on points raised as to the application of the above law to particular cases. A perusal of these decisions will well repay the student who is interested in the subject.

Distinction between Repairs and Renewals

At this point attention is called again to the need of a careful distinction between repairs (up-keep and maintenance charges) and renewals (replacements and betterments). Only a clear definition of the terms and a strict adherence to an adopted policy can prevent endless confusion and absolutely misleading results. Such a policy is necessary because in the practical handling of such items on the books the theoretical aspect of the distinction between repairs and renewals must always be modified by reason. The student is referred to the preceding chapter where more detailed treatment of this point is given.

Depreciation and Plant Efficiency

The relation of depreciation to the efficiency of a plant or an asset will now be considered. The amount of depreciation is not based on the degree of efficiency of the service rendered by the asset. In other words, a depreciation reserve is not in any sense an inverse measure of the productive efficiency of the asset to which it relates, nor does the sum of all depreciation reserves either indicate or measure the degree of efficiency of the whole plant. A comparison of present with normal value (as defined above) affords some index of productive efficiency, but there is no direct ratio between the two. In any well-maintained plant, however, the normal value is the value below which the plant cannot be allowed to fall if the standard of efficiency is to be maintained; and good management requires nothing less than this. It has been variously estimated that normal value ranges from 75% to 90% of the original cost, and in some instances runs as low as 50%. The composite depreciation of from 10% to 50% represents the limit beyond which the decrease in value cannot pass if efficient service is to be given by the plant. Usually the sum of the depreciation reserves for all the assets of the plant remains fairly constant because the large reserves against assets that are almost ready to be scrapped are offset by the smaller reserves of the assets just replaced.

Unit Efficiency

The efficiency of the _unit_, however, has a somewhat different relation to depreciation. Units, i.e., individual assets comprising the plant, are constantly wearing out and being replaced. The plant, aside from exceptional cases, never reaches the point where it must be discarded in its entirety and replaced as a whole. The depreciation of each unit continues until the point of inefficiency is reached, when it is scrapped and replaced. The unit frequently is allowed to drop below its margin of efficient service before being scrapped, and it may be made to render service much longer than is customary, by means of heavy repairs and a relatively high up-keep expense. When to scrap a particular unit involves a nice calculation. The heavy cost of repairs necessary to secure good service from the old unit and the possible loss through failure to accumulate a sufficient reserve must be weighed against the cost

of a new unit and its up-keep and running expense. Usually the efficiency of the individual unit is very like the parson's one-hoss shay which "ran a hundred years to a day and then of a sudden it went to pieces all at once."

The following chart illustrates accurately the relation of efficiency to uniform depreciation, the XCY line being the efficiency curve and XY the depreciation curve. Also curve 6 of the chart on page 105 gives a good illustration of the same point. Inasmuch as the depreciation reserve must provide for the loss of the entire asset by the time it goes out of service, it is readily seen that in judging an asset from its bookkeeping record of cost and reserve there is no measure of efficiency shown therein, since a normal efficiency must be maintained by repairs at all times. The record is, however, a good index of the _time_ when the point of inefficiency will be reached.

[Illustration: From "Principles of Depreciation," by Earl A. Saliers.

Chart Showing Progress of Uniform Depreciation and of Diminishing Efficiency]

Engineers hold the opinion that machinery as a rule cannot suffer more than 25% to 50% _actual_ depreciation and give efficient service. A depreciation reserve of anything more than that does not mean that the point of inefficiency has been reached, for the reserve is usually estimated and applied on the basis of _theoretical_ depreciation and so takes cognizance of all its factors. It has sometimes been stated that inefficiency is a factor of depreciation distinct from wear and tear, obsolescence, and supersession. It seems a better statement of the relation to say that the point of inefficient service is the limit beyond which the three factors named cannot be allowed to operate or have effect. The need of judging the efficiency of some kinds of assets is not so apparent as of others. Thus in the case of poles, wires, conduits, and the like, efficient service is secured until they are worn out, with very little expense for up-keep. That is, such assets are normally efficient throughout their whole term of life, and the application of repairs will not appreciably extend their life nor will it affect their efficiency. In the case of other assets, such as machinery, telephone switchboards, motors, etc., the item of up-keep is a very vital one in the determination of the point or margin between efficient and inefficient service, and that in turn is an important factor in the determination of the length of service life of the asset. Thus, although efficiency and depreciation are intimately related, the degree of depreciation at a given time is not by any means an inverse measure of the efficiency of the service being rendered by an asset.

Depreciation and Fluctuations in Market Value

The relation of depreciation to fluctuation in value, due to whatever causes affect the market, also deserves consideration. Depreciation primarily refers to a decrease in value from a definite cost figure, such decrease being due to certain well-recognized causes, of which change in market value is not one. Thus, while it may be correct, through a loose use of the term, to use the expressions, "depreciation of securities," "depreciation of real estate," and similar phrases, and there may be no likelihood of any misunderstanding, that is not the sense in which the term depreciation is used here. Unfortunately, market fluctuations are sometimes allowed to influence depreciation charges.

Such influence may come about in three ways: (1) In valuation proceedings for the determination of rates for a public utility company, a basis frequently used is that of the cost of reproduction or renewal less depreciation. The theory is that under existing views of private property such a company has the right to the enjoyment of all increments in its own properties and therefore has a right to such rates as will earn a fair income on the present value of those properties. Depreciation based on the present reproduction cost is in this way influenced by fluctuations in market value, and the oftener a physical appraisal is made and its determined values brought upon the books, the greater will be the disturbance of the basis for the depreciation charge. (2) Occasionally the practice is met with of basing the present depreciation charge upon the estimated cost to replace the old asset. This is discussed later and is mentioned here merely to show a possible relationship between fluctuations and depreciation. (3) Finally, in the _periodic adjustment_ of depreciation rates and charges, the estimated scrap value of the asset does affect the amount of the periodic charge. Changes in market value of scrap, which may be considered as due to causes which will continue in force rather than to the ups and downs of the market, may _legitimately_ be reflected in the depreciation charge for the remaining life-term of the asset and must be so reflected in the interests of accuracy in any statement of true values.

Distinction between Depreciation and Depletion

Inasmuch as depreciation is not here used to apply to current assets (with one exception noted below), and fluctuations in the market value of any asset subject to depreciation need not be considered, it may be well to state the class of assets to which it does apply. In general the value of all fixed or capital assets is affected by depreciation. The term frequently used in this connection

is “wasting” assets. Under this nomenclature is included any asset which wastes away or is used up. For the sake of clarity the author desires to limit the term depreciation to those assets which are clearly affected by any of the causes of depreciation as discussed in the following chapter. For those assets which are used up without any possibility of their being replaced, and the life of which cannot be prolonged by repairs and renewals, the term depletion will be used. Accordingly the term “depreciation” will be applied to mine buildings and machinery; “depletion,” to the mine. Both are wasting assets, but their waste is due to somewhat different, although vitally related, causes. No better definition of wasting assets has been formulated than that by P. D. Leake[19] who says that they “consist of all forms of exchangeable value which inevitably diminish while applied to the purpose of seeking profits, increase, or advantage otherwise than by purchase and sale.”

[19] In “Depreciation and Wasting Assets.”

Effect on Different Kinds of Business

Some types of undertakings are more subject to the effects of wasting assets than others. Concerns dealing in investments, insurance of all kinds, brokerage and commission, manufacturers’ agents, banking and financial houses, professional firms, and the like, only a small portion of whose capital is tied up in fixed assets, are comparatively unaffected by the charge for depreciation. Practically all other concerns are subject to it in marked degree—manufacturers, mines, transportation companies, light, heat, and power concerns, the telephone, telegraph, and cable, construction companies, agricultural, etc. Those engaged in extracting raw materials from the ground are, with few exceptions, subject to a charge for depletion. Those with an investment in any kind of terminating rights, such as leases, patents, copyrights, non-renewable franchises for a fixed term of years, and so on, are also subject to it. Opinions differ as to whether good-will and trade-marks may properly be considered as subject to depreciation. They will not be so considered here for reasons which will be stated when the principles of their valuation are discussed.

It will be noted that thus far all examples given have been those of fixed assets. The exception already referred to is made in the case of the current asset, merchandise or stock-in-trade. The term depreciation can perhaps correctly be used in connection with merchandise, which, however, is not to be classed as a wasting asset. Due to some of the causes discussed in the next chapter, the stock-in-trade of an undertaking does truly depreciate in value. The method of accounting for such depreciation differs entirely from that used for wasting assets. Hence, the treatment of depreciation of merchandise will be considered at the same time that its valuation is discussed (see Chapter XIII.)

Having cleared the ground with this definition of terms and the general statement of what the depreciation problem is, attention will now be directed to a consideration of the causes of depreciation, to be followed by the method of accounting for depreciation and a treatment of some points growing out of the general discussion.

CHAPTER VII

DEPRECIATION—ITS CAUSES

Analysis of Causes

Most definitions of the term depreciation set the boundaries or limits of its meaning by naming the causes. These are normally: (1) wear and tear, or physical factors; (2) inadequacy and obsolescence, or functional factors; and (3) accidents or contingent causes. This statement of causes applies specifically only to physical or tangible properties. In the case of intangible property, consisting for the most part of rights of various sorts, the controlling cause is usually merely lapse of time. The chart on the following page analyzes the various causes and shows their detailed ramifications.

Age as a Cause of Depreciation

The physical depreciation of tangible properties arises from two main causes, viz., the wear and tear from operation and the use of the asset and the wear and tear of age, known as decrepitude. Immediately upon the installation of an asset the forces of time and the elements begin their ravages even before operations begin. As H. R. Hatfield[20] trenchantly puts it, “all machinery is on an irresistible march to the junk heap,” and the statement is equally applicable to all other forms of wasting assets. The ties placed on the roadbed of a railway, conduits put in place for carrying water, gas, steam, electric current, or oil, rolling stock, poles for telephone and telegraph lines, buildings, even interior installations of various types—all are subject to the normal ravages of time and the elements, and nothing which man has been able to devise can do more than retard the inevitable. Thus, all assets

decrease in value through the inevitable lapse of time. Attention should be here directed to the fact that decrepitude depends on the _normal_ action of time and the elements, whereas accidents due to action of the elements (listed in the chart on page 121, under III, 1, b) are of an _abnormal_ character and cannot usually be taken into full account at the time of the installation of any particular piece of property.

Wear and Tear of Use

The wear and tear due to use or operation usually has a much more potent effect on the service life of an asset than that due to decrepitude. The established policy as to repairs and maintenance has an important effect on this kind of depreciation. Sooner or later every machine becomes unfit for service, due to the friction of its parts, the strains to which it is subject under normal load, those of much greater effect under abnormal load, the method of applying its power, etc. It must then either be withdrawn from service and completely depreciated, or it must be repaired in an effort to lengthen its life. It should be kept in mind that the determining factor here is efficiency. The serviceability of the machine must be kept up to a recognized standard through adequate expenditures for repairs and up-keep until the cost of up-keep is disproportionate to the service rendered, or until the machine becomes so decrepid as to make its operation hazardous.

The application of theoretical depreciation to operating wear and tear must proceed with great care. This is so because of the varying factor of maintenance. If the cost of maintenance Could be standardized, experience under such standard would give a reliable basis for the calculation of the depreciation charge. Since adherence to such a standard is difficult or impossible under the conditions that are constantly arising in a given establishment, the depreciation policy must of necessity be based on actual observation and inspection by experts. The expenditure necessary to restore an asset to a state of operating efficiency is called “deferred” or “accrued” maintenance, and it is the amount of this at a given time, estimated by expert inspection, which compared with normal maintenance forms the basis for an estimate of the depreciation charge.

Functional Depreciation

Tangible property is subject also to “functional” depreciation. This means a lessening in worth or service value due to causes, other than those already treated, which interfere with and operate against the proper functioning of the asset, making it impossible to render effectively and economically the _full_ requirements of service expected of it. This inability to fulfil its proper function may result either from inadequacy or obsolescence. “Thus the structure may suffer total depreciation and be thrown out of service, not only because through wear and tear it has reached a condition where further expenditures for repairs or attempts to make it suitable for the required service would not be economical or expedient, but also because recent improvements, or new inventions, new developments and radical changes in service, or the demands of one kind or another involving sweeping changes in the existing plant, make abandonment necessary.”[22]

[22] Leonard Metcalf paper on “Water-works Valuation and Fair Rates” before the American Society of Civil Engineers, Vol. LXIV, 1909, page 16.

Inadequacy as a Factor

Inadequacy is a condition in which the asset is found unable to meet the demands made upon it, due usually to growth of business or to some rearrangement made necessary by changed policy before the asset has reached the end of This condition is also called

“supersession.” For economical operation the asset must be discarded and superseded by a larger unit. As an example, dynamos and motors of a capacity sufficient to meet all demands on them at the date of their installation may, through growth of business, prove entirely inadequate after a few years to meet the service expected of them. Inadequacy as a factor of depreciation will have no appreciable effect in cases where the demand is fairly constant and the market does not permit of much expansion. Where there is a growing community and (or) a growing appreciation of the commodity manufactured, demand may increase to a point where original judgment and expectation will be shown to have been in error and the equipment will have to be superseded if advantage is to be taken of the expanding market.

Two main factors or compelling forces may bring about inadequacy, viz., those of internal origin and those of external origin. Those of internal origin may become effective because of: (1) abandonment of original financial policy, (2) considerations of engineering economy, and (3) unforeseen development.

Inadequacy through Change of Policy

Perhaps the best illustration of the first type is that of a plant built to supply a certain commodity to the local community. A change in ownership brings about an abandonment of the original policy and a determination to provide neighboring communities with the commodity also. This change in policy frequently comes about when several smaller plants are merged under one control and the original units are found to be entirely inadequate to meet the demand. Again, when through a change in financial policy it is decided to lower the rates of a public service commodity, the original equipment may prove inadequate to meet the increased demand. It is not contended here that this type of inadequacy is to be taken into account in estimating the depreciation charge. Usually it cannot be foreseen and should therefore be provided against under the head of a general contingent reserve or appropriation of profit. If it can be foreseen intelligently, it should be taken into account in the estimate of depreciation.

Inadequacy through Motives of Economy

The second type of inadequacy may be a foreseen and calculated inadequacy. In a new community or in the case of a new commodity whose virtues are little known, it may be the part of economy and business sagacity to install originally only such equipment as will be adequate to meet the requirements during the development stage and then when the commodity is introduced and established to discard the old and install larger and more adequate structures. Although it may be foreseen with reasonable certitude that a power plant generating a thousand horse-power will be entirely inadequate in ten years, yet it may be the better business economy to scrap it at the end of ten years rather than incur the up-keep and depreciation charges on a larger plant which would give longer service. Whichever policy, according to best engineering economy, results in the lowest unit cost of product is usually the determining factor. If with all the facts and reasonable expectations under view the smaller plant is decided upon, then assuredly the depreciation due to inadequacy must be taken into consideration.

Inadequacy Due to Unforeseen Development

The third type of inadequacy, unforeseen development, has been shown to be due to an _unexpected_ expansion of the market. This may be brought about by growth in population of the present market, growth in appreciation of the commodity manufactured, or sometimes by a lowering of transportation rates whereby new markets are opened. The very fact that this kind of inadequacy is _unexpected_ and _unforeseen_ makes impossible its inclusion in the current depreciation charge. This kind of inadequacy is revealed by a post-mortem determination of causes of which there were no symptoms leading to a correct diagnosis during life. The loss to be incurred through the scrapping of the property before its expected termination of service is a loss which must be borne by the future and not by the past. It is in the nature of a development cost which must be incurred if the opportunities of the new market are to be seized, and which must enter into a consideration of the advisability of making a bid for the new business.

Business policy might or might not dictate that these costs be charged against reserves of profits from the past. Theoretically they should be spread somewhat evenly over the future but in neither case can they have any place in present depreciation charges. It should be thoroughly understood that depreciation is a charge which relates always to the past, never to the future. There is no contradiction here in that a consideration of the future must help to determine the amount of waste which has taken place in the past. P. D. Leake[23] says: “It is a misconception to describe the annual provision for depreciation as a provision for future renewals, as though it has reference to the future. The annual provision for depreciation has nothing to do with the future but relates solely to the past. It is a replacement of capital in respect to past capital outlay expired in the process of carrying on the business.”

[23] In “Depreciation and Wasting Assets.”

Inadequacy Imposed from Without

Inadequacy may be imposed by external forces or authority. In public service utilities this has often proved a source of expense. In the interests of a supposedly enlightened opinion—oftentimes a badly mistaken opinion—present equipment is found inadequate to meet the new demands. This type of inadequacy merges imperceptibly into obsolescence. Again, a municipality at the time of repaving the streets may require that the utility company discard present equipment and install a larger and heavier type; it may require that overhead wires be carried in underground conduits; and prudence on the part of the company may lead to the installation of larger carriers than the old. These losses—and there is almost invariably a loss to the utility company—must be charged against the future. So also, the passage of laws and ordinances in the interests of sanitation and fire protection frequently compels the private owner to discard equipment and devices before their service life has passed and install more adequate equipment.

Obsolescence as a Cause

The second factor of functional depreciation is obsolescence. By this we mean that lessening in worth which is brought about by the development of something new whereby production becomes more economical or is changed to meet new ideas, fads, or fancies of the consumer. Obsolescence may be imposed by outside forces through the exercise of the police power under circumstances analogous to those mentioned under the discussion of inadequacy brought about by external means. Municipalities and regulating commissions have speeded up the “irresistible march to the junk heap” in numberless instances. Cotton-spinning and shoe machinery, lasts and patterns of all sorts, electrical devices in particular—all have been subject to obsolescence charges. The horse car gave place to the cable car, which in its turn was displaced by steam locomotion, and today this has given way to electrically propelled street cars. The old wooden rail gave way to the rail of wood capped with a strip of steel, the light “T” steel rail, and the present heavy steel rails—changes all necessitated by changes and developments in the art and a demand for better service by the public. The stick used by the Indian to turn the ground and plant his corn has been displaced successively by hand tools of iron and steel, horse-driven plows, and the big steam and gas tractors of the present day. No industry has escaped the seemingly inevitable trend towards the displacement of the old and antiquated but not worn-out equipment, by newer, more up-to-date, and more economical equipment. Obviously the last word has not yet been spoken or the last refinement been made in the development or application of art and science to any industrial enterprise. Life means development; dry rot and retrogression are the fate of any art, any industry, any people which has reached the limit of its development.

Since, therefore, obsolescence is so common an occurrence, so absolutely a fact of general experience, it would be folly to ignore it. Many writers and some authorities have said that while obsolescence is as certain and ever present as the forces of nature, it seldom is more possible of measurement than are they. However, engineers tell us that in most cases it is possible for qualified experts to foretell with _reasonable_ certainty the effect of obsolescence. “Those most familiar with the art know the units which will be able to serve their entire physical life, and what classes are so uneconomical or otherwise defective that some improvement must be expected.”

Treatment of Obsolescence

As to the effect of obsolescence, attention should be called to the fact that it is seldom operative to its full extent. The decision as to the exact time of discarding the old and installing the new rests on a nice balancing of many factors. Thus, the safety devices operated by hand on railroads are not displaced in a wholesale manner by those which operate automatically. In a large telephone company old switchboards are not discarded for new over the entire system at the same time. Much of the old is oftentimes allowed to serve out its life-term, and obsolescence has no effect. Under the circumstances stated above, and many similar and more complicated conditions, it requires a nice calculation to determine the actual effect of the factor of obsolescence in depreciation. Many inaccuracies, even many ridiculous conclusions, in estimates made by experts are met with, times without number. The novice thus fears even to guess as to the amount of the depreciation due to this factor. That is perhaps as it should be; there is no place here for the novice. Inasmuch, however, as the trend is to estimate the depreciation due to obsolescence, and such practice has the unqualified approval of many public service boards and at least the silent approval of our courts, it would seem that an attempt should be made to include it in the depreciation charge. As to its sufficiency or insufficiency, an amount can be estimated with as much accuracy under the head of depreciation as under that of a contingent reserve, and the former course is to be preferred in that an inevitable fact of experience in almost every industry is thereby recognized. The past, and not the future, is thus

burdened with the accomplished waste. There doubtless will be instances where depreciation due to obsolescence palpably cannot be foreseen. For such there is but one of two courses, viz.: either to charge it against profits reserved out of the past, or burden the future with its cost.

Relative to the inclusion of obsolescence in the depreciation charge, the Illinois Public Service Commission says in the case of the City of Springfield v. Springfield Gas and Electric Company, March, 1916: “In view of all the facts in this case, the Commission finds that it is but reasonable, proper, and equitable to make deductions from cost new to cover accrued depreciation, both physical and functional....” The statement of the Maryland Public Service Commission in the case of the Chesapeake and Potomac Telephone Company of Baltimore City has already been cited on page 106. Quoting from the report of the Valuation Committee of the American Society of Civil Engineers: “A limited search ... indicated that inadequacy and obsolescence were included either in ascertaining the amount of depreciation to be included in cost, or to be deducted from earnings ... by the commissions of the following states: Arizona, California, Colorado, Illinois, Maryland, Massachusetts, New York, Oregon, South Dakota, Wisconsin.”

Covering this feature, i.e., the depreciation feature, in making returns to the government under the Federal Income Tax of 1916, the Commissioner ruled as follows: “The deduction for depreciation should be the estimated amount of the loss, accrued during the year to which the return relates, in the value of the property in respect of which such deduction is claimed, that arises from exhaustion, wear and tear, or obsolescence out of the uses to which the property is put.... The depreciation allowance, to be deductible, must be, as nearly as possible, the measure of the loss due to wear and tear, exhaustion, and obsolescence.”

Although not specifically mentioned, functional depreciation may be said to have the sanction of the United States Supreme Court in its decisions covering the Knoxville and Minnesota rate cases. In the case of the Des Moines Water Company v. City of Des Moines, 192 Fed. 193, September 16, 1911, the court allows both “functional and physical depreciation.”

It would seem, then, that the legality of the practice is pretty well established and the ability to compute the amount has been recognized. It is not often the case in matters of business policy and prudence such as this that the courts lead where business men and some professional men are reluctant to follow.

Contingent Depreciation

A third factor in depreciation is given in the chart on page 121 as contingent. The term would seem to indicate on the face of things that it is not a factor of sufficient definiteness and certainty to make possible its prevision and therefore the calculation of its effect. Hence it might seem that provision could be made for it only by means of a general reserve. In many individual cases and as to its application as a universally operative factor in the same sense that are use and wear and tear, the position is undoubtedly well taken. The term contingent, as here used, is meant to cover not only things which have happened and _may_ happen again, but also things which in given localities and under known or knowable conditions are more or less inevitable. Hence while not found present in all cases, where conditions are favorable to the happening of any of the contingencies, from the standpoint of prudence and an equitable distribution of the burden of costs, provision should be made for them as one of the items comprising depreciation. Contingent depreciation may comprise three classes of contingencies, viz., (1) accidents, (2) diseases, and (3) diminution in supply.

Accidents. With regard to the first class, M. E. Cooley, in the Milwaukee Three-cent Fare Case, says: “An engine or a boiler may be wrecked and with it other machinery. This might, and probably would, involve a considerable expense for repairs or replacement, besides possibly crippling the plant in part. Cars may collide or a car may drop through a bridge. A bridge itself may fall or be carried away by floods. A storm, as a cyclone, may work havoc, entailing costs in excess of those proper to be charged to ordinary maintenance of property.” Accidents may happen either as a result of negligence or as a so-called “act of God,” i.e., the elements, or a hidden defect in the structure. With regard to depreciation from accidents it may be quoted, “There is always a certain amount of loss by accident which seems to be inseparable from the business. Usually it can be counted on in advance, and no amount of care and precaution will entirely eliminate it.”[24] The Railway Library for 1910 says that of 899 railroad accidents the various causes were:

Malicious acts 30 accidents Elements 104 ” Structural defects 117 ” Various forms of negligence 648 ”

[24] Spring Valley Water Co. v. San Francisco, 165 Fed. Rep. 703.

In a large concern where past experience may serve as a guide to the future, depreciation of this sort can be rather accurately estimated. In the case of the rolling stock of a railroad, statistics make available the yearly loss due to accidents from whatever

cause. It is argued that such losses are fairly uniform from year to year in a large system of that sort, and each year's operation carries the burden simply by charging all repairs incident thereto against the revenues of that period. This is, of course, true in the main and may give sufficiently accurate results. The same treatment may also be applied to replacements, and if the units are sufficiently small in value in comparison with their number, practically no inequity as between periods will result. However, the Interstate Commerce Commission has ordered that depreciation reserves shall be set up for the proper handling of such accidents and this seems the better method. Statistics are available as to how frequently explosions in powder factories are apt to occur and the losses due to them, so that a manager can calculate the provision to be made on that account. Those are simply the risks of the particular business, and wherever it is known that they are applicable to any kind or group of equipment or other assets, certainly the current operations should bear their share.

After all, depreciation charges due to any causes are much of the nature of insurance which has to be carried by the enterprise itself because the risks have not yet been reduced to an insurable basis. Much as a proprietor may dislike to carry his own depreciation insurance, he is compelled to. In connection with accidents as a part of the depreciation charge, it should be noted that the product should not be charged twice for this item. If regular insurance is carried for fire, flood, tornado, earthquake, and the like, certainly those elements should be omitted from the insurance risk carried as depreciation by the concern itself.

Disease. Under certain conditions as to climate and local environment, the ravages of disease must be reckoned with. Diseases are caused by:

1. Parasites 2. Water pollution 3. Growths in water mains 4. Electrolysis 5. Crystallization[25]

[25] A. S. C. E., Vol. 31, page 220, article by R. Montfort. A. S. C. E., Vol. 40, page 178, article by C. H. Snow. Association Engineering Societies, Vol. 31, page 49, by F. W. Hodgson. U. S. Gov't, Bureau of Entomology Bulletin #94, Pt. 1, by T.E. Snyder. U. S. Gov't, Bureau of Plant Industry Bulletin #64, by G.T. More and K.F. Kellerman. U. S. Gov't, Bureau of Plant Industry Bulletin #76, by G.T. More and K.F. Kellerman. U. S. Gov't., Dep't of Agriculture, Forest Service, Circular #128 by C. S. Smith.

Losses and deterioration from these causes are quite appreciable in some enterprises. Telephone poles are subject to attack by borers and woodpeckers. "More than 50% of the weight of the wood may be removed ... without being greatly manifested upon the surface." "At least 10% of the chestnut poles reset or replaced are injured by insects." Railroad trestles, bridges, docks, piers, wooden shipping, and structures of all sorts are more or less subject to this kind of depreciation. Minute vegetable growths known as algae may cause a marked depreciation in a water utility. Other forms of vegetable and animal organisms sometimes cause growths in water-pipes, resulting in a partial shutting off of the capacity. Similarly, mineral growths may produce like effects. Iron oxide (common rust) and lime deposits or scale are frequent causes.

Electrolysis. Depreciation caused by electrolysis is a highly technical subject, discussion of which will not be attempted here. "Electrolysis is a chemical decomposition produced by an electric current. As applied to utilities, electrolysis is the disintegration of metal structure caused by the electrolytic action produced by stray electric currents, generally from the return circuits of single trolley electric railways." The damage, both direct as above stated, and indirect as in the leaking of water, gas, etc., or in the flooding of adjacent premises or injury through gas explosions, is recognized by the courts, but the satisfaction granted is limited to enjoining a continuance of the injury.

Molecular Change. In some kinds of machinery subject to heavy strain and shock when in use, a disintegration of the structure itself takes place whereby its resisting power and therefore its efficiency are greatly impaired. This condition is known as a crystallization of the molecules.

Depletion. Finally depreciation due to contingent causes may be brought about by a diminution in the supply. This is more in the nature of a depletion charge and will be fully considered in connection with that subject treated on page 117.

Terminable Rights

The intangible property subject to depreciation consists of terminable or limited rights. Rights given or held for a definite period of time expire or waste away through the lapse of time. Decrepitude is the controlling factor here, and because of the definiteness of the length of time, the depreciation charge is easily calculated. Therefore provision must be made for it. Various methods, resulting in quite different charges to each period, are sometimes employed. These methods will be discussed in Chapters IX and X. Rights which are not terminable or limited—and even limited rights—may, however, be given up or abandoned. This is a situation which cannot usually be foreseen and therefore cannot be provided against except by means of a general reserve.

Effective Depreciation

One final point in connection with the causes of depreciation needs consideration. Though _all_ of these various causes or kinds of depreciation are seldom found operative on a given asset, frequently several of them are so operative. Where this is the case their effect is not cumulative. One or the other will prove a controlling factor in determining the service life of the asset and thus the amount of its periodic depreciation. There is a close relation between the operation of the chief factors in depreciation and the scrap value of the asset. Thus, if it is estimated that physical depreciation will be complete in 8 years, obsolescence in 10 years, and inadequacy in 12 years, scrap value would be slight. If, however, inadequacy is the controlling factor, becoming operative in 8 years, with obsolescence in 10 years, and physical depreciation in 12 years, clearly scrap value might be quite appreciable. Whichever factor is the controlling one, that factor is said in a given case to constitute the _effective_ depreciation for that asset. Thus, in the first case mentioned, physical depreciation constitutes effective depreciation and would form the basis for the estimated charge, while in the second case inadequacy is the effective factor.

CHAPTER VIII

DEPRECIATION—FACTORS OF RATE DETERMINATION

Fundamental Purpose of Depreciation

Under the head of accounting for depreciation, which forms the subject of this and following chapters, will be considered:

1. The purpose of the depreciation charge. 2. Rates of depreciation and their relation to repairs, renewals, and replacements. 3. Methods of reckoning depreciation and their effects. 4. Handling depreciation on the books. 5. Financing depreciation and some related problems.

Though much has been written about the causes and kinds of depreciation, the necessity of considering it, and methods of calculating its amount, so far as the author knows there has been no adequate presentation of the fundamental purpose of the depreciation charge viewed _both_ from the valuation or balance sheet point of view and the operation or profit and loss standpoint. The statement is frequently made that the purpose of depreciation and the necessity for considering it is to maintain intact the value of the original capital invested. In so far, therefore, as this necessitates a periodic charge against revenue, resulting in a retention in the business, either in a specific or floating form, of some of the revenue-producing assets, the operating or profit and loss phase of the business is affected. This secures the integrity of the original fund of capital by making the revenue receipts unavailable for distribution among the stockholders until the portion of the assets wasted away has been made good. This view of depreciation has as its actuating purpose a showing of correct values in the balance sheet, with little regard to the purposes to be served by the depreciation charge against operations. This emphasis of the problem of valuation is usually looked upon as primarily the engineering viewpoint.

Depreciation a Cost of Operation

On the other hand, many students of the problem view the depreciation charge as incurred for the sole purpose of determining the correct costs of doing business. Unquestionably, depreciation is a cost of production. A portion of the service life of equipment goes into each unit of the product, and depreciation constitutes a cost which must be borne by the product with as much reason as the labor power that fashions and forms it and the raw material out of which it is made. To determine a cost of production and a profit without the inclusion of the depreciation charge would be, as R. H. Montgomery[26] says, just as logical as “to state that a candy manufacturer had earned a net profit of $100,000 and that out of said $100,000 there had been set aside $20,000 to pay for the sugar consumed in the manufacture of the product. The use of that which is consumed is a loss or expense. Machinery is consumed; sugar is consumed. You cannot say that one is an operating expense and the other is an item which need not be ascertained nor taken into account until the net profit is shown.... If the provision for depreciation is an item which cannot be included among the costs of operation, there is something wrong.”

[26] In “Income Tax Procedure, 1918.”

This view of depreciation attempts to show the correct costs in the profit and loss statement of operations, without much regard to its effect on the balance sheet except that, in so far as every charge against operations is reflected among the assets, the fact of its inclusion as an operating cost automatically works also as a means of declaring correct values. Under this view—which may,

without any misstatement perhaps, be called the accountant's viewpoint—the emphasis is placed on the effort to show true costs of the product, and only incidentally a true valuation of the assets.

Complication of Short Fiscal Periods

Theoretically there is no conflict of views here—only a difference in emphasis. It is purposed, however, to show some of the practical difficulties encountered in the full application of either view. As has been stated in an earlier chapter, the ideal time in so far as depreciation is involved for the determination of financial results would be the time when all the elements of production entering into the product have been completely used up—if this were possible. There would then be no troublesome problems as to inventories, accruals, or deferred charges. The fiscal period would coincide with the natural service-life periods of all the producing elements. The problem of depreciation would then be a simple one, and the entire value of the equipment would be a charge to the product turned out during its life-period. Such a method of determining the financial results of an enterprise is, of course, merely fanciful. There is always, and will be always, an overlapping of the life-periods of the various units of a plant. Furthermore the practical necessities of modern business and competition require a much shorter fiscal period with a more frequent figuring of results and showing of condition. It is due to this shortening of the fiscal period to one month, six months, or a year that the difficulties of the depreciation problem arise and inaccuracies of statement are consciously or unconsciously made.

The handling of the problem hinges on the answer to the question as to the correct basis for the distribution of the depreciation charge. Shall a fiscal period of arbitrary length be used as the basis for determination of the service life of the operating equipment? Or shall the life of inanimate equipment be measured in terms of units produced, service rendered, results achieved, just as human life and age may be measured in terms of intensity of thought and action? It is unfortunately true that once the depreciation charge is settled, this same charge is constantly applied with little adjustment to changing conditions. Thus, varying intensity of service is not reflected in the periodic charge.

The Factor of Idle Time

Were it possible to foretell length of service life in terms of units of product instead of units of time, a much better approximation to actual results would be secured. And this very thing is _attempted_ under almost all methods of estimating depreciation. The life-period of the equipment is estimated on an assumption of _average_, _normal_ use of the equipment—an assumption which will give good practical results when and so long as operations are normal or average. When, however, a period of depression comes and much of the equipment is idle, it is clear that that period would be burdened unduly with a depreciation charge based on _years_ or _months_ of service life. On the other hand, a period of feverish activity would not bear its just share of the burden of wasting assets. The period which is really overburdened must necessarily reflect it as an undervaluation of the assets—more has been charged off than has been used up; while the opposite is true of an underburdened period. Of course, on the theory of averages, by the end of the life-period of an asset all inequalities would be ironed out. Some methods of cost-keeping take this factor of intensity into account and spread the depreciation charge on a man-hour or machine-hour basis, which proportions it somewhat equitably to the product turned out by the use made of the machine and not to its elapsed life in days or months. The best that can be hoped for is as near an approximation to the truth as possible.

Depreciation a Means of Financing

Another view of the purpose of the depreciation charge is that it is a method or means of _financing_ depreciation as it is sometimes termed. Under this view the effect of the depreciation charge on intermediate periods is lost sight of and it is used solely as a means of securing a sufficient contribution in hand _at the end_ of the service life of the asset to finance its replacement. In other words, no attempt is made through the periodic depreciation charge to secure an accurate or necessarily true statement of the values of the assets, nor to see that the product of a given period is burdened with its just share of _all_ costs, though this may be an incidental purpose. H. V. Hayes[27] in discussing this phase of depreciation says:

[27] In "Public Utilities, Their Cost New and Depreciation."

"It is argued that the plant unit 'deteriorates' year by year and that this 'deterioration' is the true measure of the 'depreciation' in the value of the unit during the intermediate years of its life, and, being a physical condition of the plant, can in no way be measured by the purely financial considerations upon which the reserves for depreciation necessarily must be based. Such a line of reasoning is absolutely faulty. Any attempt to reconcile 'deterioration' with 'depreciation' at any intermediate period in the life of the plant of an undertaking, is not only unnecessary but futile. The error in such an attempt arises from a failure ... to recognize the fact that ... if

definite agreement has been reached as to the serviceable life (of the asset), the physical ‘deterioration’ of the unit, at any time during its life, can be a matter affecting its intrinsic value in no way whatever.”

Danger of the Financing Viewpoint

The above statement is a fair presentation of the case for depreciation as a financing device. It would seem, however, that the exponents of this view lose sight of the inevitable fact that the depreciation charge is _pro tanto_ an evaluator of the wasting asset during the intermediate period of its life. Therefore a logical conclusion to be drawn from the view as expressed in the quotation above, would be the countenancing of any method by means of which provision could be made to replace the asset by _the end_ of its life, no matter whether the charge was spread evenly over its life, was made all in one year, or was made to depend on the amount of the net profits at the end of a given year. This latter alternative is a dangerous policy, always to be deprecated, for depreciation is a cost of production to be taken account of _before_ profits can be determined.

After all, it may be said without fear of serious contradiction that all three views, i.e., the engineering, the accounting, and the financing viewpoints, must be held in mind in any adequate treatment of the depreciation charge. The important point from the commercial and accounting standpoint is to secure a fair and equitable charge to each unit of product, regardless of whether or not the burdens of each fiscal period are equal. This is particularly evident when wear and tear from use is the _effective_ factor in depreciation—and it is also contended that the factors of obsolescence and inadequacy may be as successfully and relevantly estimated in terms of business output as in years. If this results in an accurate valuation of the asset—and it is conceded that from the engineering viewpoint it may sometimes so result—the inaccuracy is of minor importance. According to the general law for the valuation of fixed assets, changes in the market need not and should not, as a general thing, affect the values at which the assets are carried on the books _of a going concern_. It is, of course, a corollary to the main proposition that this treatment also makes adequate provision for financing the fact of depreciation. Various methods and means for the accomplishment of these purposes are given in Chapter IX.

The Standardization of Depreciation Rates

The determination of the rate of depreciation of a given asset is essentially an engineering problem. But as the accounting for depreciation is dependent on the rate, and the records of the accounting department must furnish much of the information for estimating the rate, the whole problem of fixing depreciation rates will be considered under the one head. Much study and effort to reduce all the conditions under which assets depreciate to a common basis and so to a definitely stated rate for each set of conditions, have, so far, come to naught and all qualified experts say without reserve that the rate of depreciation is an individual problem. It is to be hoped that a further gathering of statistics as to expectations of life of different assets under varying conditions will ultimately furnish tabulations, corresponding to insurance tables, according to which under known and expected conditions a fairly accurate rate of depreciation for a particular asset may be made. Unlike insurance rates, however, the depreciation rate once established will not necessarily remain constant, but must be subject to a periodic revision in the light of new data and conditions.

Effect of Local Conditions

Many factors enter into the rate of depreciation. They may be classed roughly as “stable or normal” factors and “contingent” factors. It should be constantly borne in mind that in the present state of the actuarial development of the subject, general rates, i.e., rates which will apply without readjustment, cannot be determined. For the determination of individual rates local conditions are always the controlling factor. An illustration in point is given by Henry Floy,[28] showing the varying rates used by thirty-one different concerns for the depreciation of their rolling stock equipment. The methods vary in almost every case, comprising annual charges of an arbitrary amount, per cent of the original cost, cents per car mile, arbitrary deductions from income irregularly applied, per cent of gross earnings, per cent of present estimated values. Reduced to a common basis, the per cent methods show a range of expected life varying between ten and one hundred years. While it is improbable that had the determination of the depreciation rate for the different concerns been in the hands of the same expert, there would have resulted these bewildering variations in method, still it does bring out in strong relief the fact, well recognized by experts but so often lost sight of by those unacquainted with the technical phases of the problem, that local conditions are a _controlling factor_; and that until local conditions can be somewhat standardized there is no hope of establishing rates of depreciation which will be of general application.

[28] In “Value for Rate-Making,” pp. 255-256.

Factors in Determining Depreciation Rate

In the determination of rates the factors to be taken into account are:

1. Normal operating conditions. 2. Normal load or normal _intensity_ of operation. 3. Normal repairs policy. 4. Normal climatic conditions.

These constitute the most important stable or normal factors. Among the contingent elements, the most important are:

5. Probable misuse and neglect brought about by the demands of the trade, resulting in a change in the factor of normal intensity. 6. Probable change in ownership and consequent change in policy. 7. Probable change in the requirements of the market, necessitating an adaptation of the equipment to uses for which it was not originally intended.

At the time of installation the rate of depreciation must be based only on the normal factors—things which can with reasonable certainty be counted on. At intermediate periods in the life of the asset, a physical inspection should be made to compare the actual depreciation of the property with the estimated. If, then, it is found that any contingent factors have become real or reached the point of reasonable expectancy, these provide the basis for an adjustment of the rate for the remaining life-term of the asset.

Basis of Normal Rate

With regard to the normal rate, the following items demand first consideration:

“1. Exterior or movable apparatus

(a) Abuse (b) Neglect (c) Temperatures (d) Oxidation (e) Irregular shocks in use, such as starting or braking, also road or rail defects

2. Installed operating and generating machinery

(a) Reversals, increased by rapidity and aggravated by shock (b) Irregular loads or service, aggravated by speedand sudden character (c) Excessive usage, resulting in increase of temperature of parts

3. Fixed equipment including boilers and piping

(a) Excessive and irregular strains (b) Interior causes of decay (c) Chemical action

—all these being of greater or less effect, according to the time of daily usage and lack of periods of rest.”[29]

[29] R. P. Bolton in “Power for Profit.”

Policies as to Repairs

Without doubt the most important single factor in the determination of the depreciation rate is the normal policy as to repairs and maintenance. Physical deterioration is constantly at work. If this is counteracted by a liberal maintenance policy, not only is more efficient service secured but a longer service life is thereby insured. As soon as repairs are needed, although the efficiency of the asset may not be immediately impaired, the _rate_ of deterioration is much accelerated unless the condition is corrected. Deterioration takes place day by day, but repairs obviously cannot be made at such short intervals—both because of the difficulty of detection and also because such a policy would not be economically practical. Every concern must consider its own peculiar problems and determine from these what shall constitute its normal repairs policy, and so far as possible this should be adhered to. The charges for repairs are bound to be of a more or less irregular character. Their handling is discussed on page 147.

Regardless of what the established policy as to repairs may be, conditions are sure to arise which make strict adherence to it impossible. There may occasionally be lack of funds at the time repairs are customarily attended to; it may be impossible to get the expert labor needed or the parts to replace worn-out units; or, and of oftenest occurrence, the need of repairs may coincide with a period of intense activity when the plant is being worked to its limit and in consequence there is no opportunity for making repairs. It is clear that rates based on one shift and the normal use of equipment during eight hours would be inadequate for three shifts and twenty-four hours of use; for in addition to a threefold intensity of operation this makes impossible adherence to the normal repairs policy based on an eight-hour schedule.

Depreciation Rate an Engineering Problem

From the above discussion it is apparent that the determination of rates is essentially an engineering problem. The accountant, however, needs a knowledge of the fundamental considerations and requirements of fixing depreciation rates and an appreciation of the difficulties of the problem. As Henry Floy[30] says: “What engineer is able to foretell the misuse and neglect or care and high degree of maintenance that any given apparatus or ... property as a whole will receive, even during the next five or ten years, with vicissitudes of climate, load conditions, changes of management, and requirements of the public?” On the other hand, in the opinion of another prominent engineer, “Consideration of these matters (misuse, neglect, etc.) may eventually form the basis for a systematic appraisal of the probabilities of life, or average of the risks, which would provide a method for the insurance of the life of machinery.”

[30] In “Value for Rate-Making.”

The author does not attempt to discuss the relative merits of the two contentions other than to point out the fact that engineers are not discouraged in spite of the many contingencies and uncertainties inherent in the problem. They are constantly gathering data from which conclusions as to rates are being formed, the use of which is being compelled by regulating bodies. It is possible that the problem will ultimately be worked out on some kind of an insurance basis.

Attitude of Regulatory Bodies

At the present time the attitude of most regulatory bodies—public service boards, federal commissions, and tax officials—is well expressed by a regulation of the Public Utility Commission of New Jersey which says that, “Until otherwise prescribed, the amount estimated to be necessary to cover such wear and tear and obsolescence and inadequacy as have accrued during any month shall be based on a rule to be determined by the accounting corporation; such rule may be derived from a consideration of the said corporation’s history and experience. A general statement of the rule in use by each company, together with the general information upon which it is based, is to be filed with the Board of Public Utility Commissioners.” The trend at the present time is towards a more thorough supervision of depreciation rates on the part of many public service boards, and the future will undoubtedly see interesting developments.

Methods of Handling Repairs

Three distinct practices are met with in handling repairs and renewals on the books. The most general method is dictated by ease of application and rests on the theory of averages, viz.: that the amount of repairs annually recurring for depreciating equipment in all degrees of deterioration and all stages of decay and age is a fairly constant figure which secures an equitable distribution over the product of the different years. The larger the plant and the greater the variety of the equipment used, the more nearly does this work out as expected.

Further consideration will be given to this point in the discussion in Chapter X of the effect of the various methods used for calculating depreciation on the equality of the distribution of the charge.

Another method, used in plants where a very accurate determination of the costs of production is desired, has as an outstanding feature a preliminary estimate, made at the time of installation, of the expected amount of repairs needed during the entire life of the asset. Periodically this estimate, or proportional share thereof, is brought on the books as a charge to Repairs and credit to Reserve for Repairs and so is spread evenly over the service life of the asset. As repairs are actually made, the cost of these is not charged against operation but against the reserve created for that very purpose. At a given time, the status of the reserve account shows: (1) if the equipment has just been placed in a normal state of repair, the under-or over-estimate of the amount of actual repairs needed, or (2) if the equipment is not in repair, the reserve account gives an index of the probable amount of deferred maintenance. Both items of information are of value in the proper management of properties. It is to be expected, of course, that during the early years of the life of an asset there will be a fairly large credit balance in the reserve because repair charges are light. The credit balance so accumulated will be needed during the later years when the costs of maintenance become heavier.

The third method, which is a variation of the second, has as its characteristic feature the inclusion of the repairs cost with the depreciation charge. This likewise necessitates a preliminary estimate of the amount of expected repairs during the life of the asset. Instead of being handled separately, it is added to the depreciation rate and in this way charged against the product. This method has been prescribed in the case of some utilities in England but is not much used here. Under this method two depreciation

estimates of probable life are necessary, viz.: (1) maximum life brought about by an inclusion of repairs, renewals, etc., and (2) minimum life without such repairs. By this it is not meant that other methods of calculating the depreciation rates fail to take cognizance of the repairs factor, but that this method specifically calls attention to it and includes it in the charge made. It seems best for regulatory boards to make a separate book record of repairs and depreciation, thus insuring against any oversight of the factors of depreciation and also insuring the correctness of a statement of condition.

CHAPTER IX

DEPRECIATION—METHODS OF CALCULATING

Methods of Calculation

Many methods of reckoning depreciation have been devised; some good, some bad, and some too theoretical and involved ever to serve the practical needs of business. It is proposed here to explain those methods which have found most favor and, in Chapter X, to discuss their effects from the standpoint of the true purpose of any scheme of depreciation.

There are several ways in which the depreciation calculation can be made, and the methods may be classified broadly, though with some overlapping, under four heads. These classes are:

1. Proportional Methods 2. Variable Percentage Methods 3. Compound Interest Methods 4. Miscellaneous Methods

Factors of Calculation

The factors which must be known under most methods of calculation are:

1. Original cost of the asset 2. Scrap or residual value 3. Estimated service life 4. Under some methods, an arbitrary interest rate

By original cost is meant full cost of the asset in position ready for use. By scrap value is meant the estimated value of the asset at the time of its discard, when removed from position and ready for sale or other mode of disposal. This is sometimes called its salvage value as distinguished from its value while still in position to render service but awaiting discard or break-up. By estimated service life is meant the time during which the asset will be used for service. This may be expressed in ordinary units of calendar time, such as the year; or in units of service time, such as working hours; or finally in units of output, such as tons, cubic feet, kilowatt hours, etc.

Symbols to be Used

For purposes of notation and reference the following symbols will be used:

V = original cost V■ = depreciated value at end of first period V■ = ” ” ” ” ” second period V■ = ” ” ” ” ” last period, i.e., scrap value n = length of service life d = rate of depreciation per period D = total amount of depreciation, i.e., V - V■ D■ = amount of depreciation during first period D■ = ” ” ” ” last ” r = rate of interest R = 1 + r, i.e., 100% plus the rate 1 - r = 100% minus the rate A = annual amount to be paid under the compound interest methods

It should be noted that the foregoing factors are all estimates, with the exception of original cost, and that when making these estimates the principles of depreciation as discussed in preceding chapters must be taken into consideration. Thus, a decision must be made as to whether physical or functional depreciation is the controlling factor in determining service life. In the determination of service life, the policy as to repairs, renewals, and maintenance has a very important bearing. In fixing the scrap value, the relation of inadequacy, obsolescence, wear and tear, and age to the values remaining in the asset must be considered.

1. PROPORTIONAL METHODS

Proportional methods include all those in which the periodic depreciation is calculated as a proportional part of some fixed basic value. These may be grouped under the following subclass titles, each of which will be separately considered:

(a) Straight Line (b) Working Hours (c) Composite Life (d) Service Output

(a) Straight Line Method

The “Straight Line” method, so called because its graphical representation is a straight line, is perhaps the simplest of all methods for calculating the periodic depreciation charge and is therefore the most widely used. Under it the loss of value for each period is proportioned to the length of service life. Thus, an asset whose service life is reckoned as 10 years will have depreciated one-tenth by the end of the first year, two-tenths by the end of the second year, and so on. The depreciation for each year is the same. Shown by formula, using the notation above, this will be:

(V - V■) D (1) D■ = ------- or --- and, evidently, n n

V■ = V - D■; V■ = V■ - D■; etc.

From these formulas a schedule of appraisal for a given asset may be made up showing its values as at the end of each year of its estimated life. For an asset costing $150, of which the service life is 5 periods and the scrap value, due to inadequacy, is $50, such an appraisal schedule would work out as follows:

==========+==============+==================+================== Age in | Periodic | Depreciated or | Total Accumulated Periods | Depreciation | Appraised Value | Depreciation ----------+--------------+------------------+------------------ 0 | $..... | $150.00 | $..... 1 | 20.00 | 130.00 | 20.00 2 | 20.00 | 110.00 | 40.00 3 | 20.00 | 90.00 | 60.00 4 | 20.00 | 70.00 | 80.00 5 | 20.00 | 50.00 | 100.00 ----------+--------------+------------------+------------------

Here, the fixed depreciation base, i.e., the amount to be written off over the 5 periods, is $100 ($150-$50). Graphically presented below, we have the straight line AB representing the periodic appraised values, and the line OC, the accumulating depreciation.

[Illustration: _Graphic Chart—Straight Line Method_]

(b) Working Hours Method

Where the “Working Hours” method is used, the life of the asset, instead of being estimated in calendar units of time, is given in service units as so many working hours. Thus, if it is estimated that a machine will stand 12,000 hours of operation, its service life is stated as 12,000 working hours. Record is kept of the number of hours the machine is operated during each fiscal period and compared with the estimated length of service life (also in working hours) to give the proportion of the total depreciation which must be charged to a given period. Using the same example—an asset costing $150, with scrap value of $50, and service life of 12,000 working hours—the appraisal schedule will be as shown below, assuming that during the first fiscal period the asset was used 3,000 hours, during the second 4,500 hours, the third 2,700, the fourth 1,200, and that it was scrapped some time during the fifth fiscal period after another 600 hours of operation.

=========+=========+==============+=================+============= | | | Total Age in | Service | Depreciation | Depreciated or | Accumulated Periods | Hours | Rate % | Appraised Value | Depreciation ---------+---------+--------------+-----------------+------------- 0 | ..... | ..... | $150.00 | $..... 1 | 3,000 | 25 | 125.00 | 25.00 2 | 4,500 | 37½ | 87.50 | 62.50 3 | 2,700 | 22½ | 65.00 | 85.00 4 | 1,200 | 10 | 55.00 | 95.00 5 | 600 | 5 | 50.00 | 100.00 | ------ | ------- | | | 12,000 | 100 | | ---------+---------+--------------+-----------------+-------------

The following chart shows graphically the appraised values and the accumulated depreciation as at the end of successive fiscal periods. The character of the curves here has no relation to the lapse of calendar time, i.e., fiscal periods, but depends entirely on the degree of intensity of operation of the asset, i.e., its service life in working hours. The above curves are true, therefore, only for the particular data assumed and do not, in any way, indicate a characteristic tendency of this method. Were the bottom line of the chart, the abscissa, laid off proportionately on the basis of working hours instead of fiscal periods, both graphs would, of course, become straight lines. It is only because information as to values is desired at the close of each fiscal period that the curves representing values become broken lines.

[Illustration: _Graphic Chart—Working Hours Method_]

(c) Composite Life Method

Another proportional method, which in its operation is similar to the straight line method, is known as the “Composite Life” method. Its feature is the calculation of depreciation on the plant as a whole, rather than on each individual asset. Under it what is known as the _mean_ life of the plant is calculated. Depreciation may then be estimated, on the straight line or other basis, for the entire plant. To determine mean life it is necessary to “weight” the life of each individual asset with its value and so get a common basis,

the dollar-year, for all assets. The process of calculating mean life will be explained in Chapter XI where also its use and adaptability are discussed. Aside from the determination of mean life, the method does not differ from others which have been or will be discussed.

(d) Service Output Method

A fourth type of proportional method is known as the “Service Output” method. Under it, the life of the asset is reckoned in terms of _quantity_ of output. This is very similar to the working hours method but differs in the unit of measurement for service life. The life of the asset is measured by its product. Thus, the life of a water filter may be given in terms of gallons or cubic feet of water run through it; that of a rock crusher in terms of the cubic feet of rock handled; that of a freight car or engine in terms of car miles; and so on. If, therefore, record is kept of the performance of such an asset for the fiscal period, the amount of depreciation to be charged off is readily calculated, being such a portion of the total depreciation as the units of output for the current period bear to the total units of life output. It is thus a straight proportional method. Its appraisal schedule and graphical representation are exactly similar to those of the working hours method. It should be said, however, that sometimes the service output method is operated on a sinking fund basis instead of on a total depreciation basis. When the sinking fund basis is used, the total payments into the fund, excluding all interest accretions, constitute the total amount of depreciation to be distributed over the service output.

2. VARIABLE PERCENTAGE METHODS

The second main classification of methods, called for want of a better title, “Variable Percentage” methods, differs from the proportional methods in that either the base or the percentage rate varies for each estimate of depreciation. The various proportional methods can all be expressed as percentages but their base remains fixed and is always the total amount of depreciation to be charged off. Under the variable percentage methods, if the percentage is fixed, the base varies; and if the base is fixed, the percentage varies. The subclasses here are:

(a) Fixed Percentage of Diminishing Value Method (b) “Changing Percentage of Cost Less Scrap” Method (sometimes known as the “Sum of Expected Life-Periods” Method) (c) Arbitrary with Increasing Amounts (d) Arbitrary with Decreasing Amounts

(a) Fixed Percentage of Diminishing Value Method

The “Fixed Percentage of Diminishing Value” method estimates the periodic depreciation as a fixed percentage of the appraised or book value of the asset as at the time of the last appraisal. Thus, if the asset cost $1,000 and the fixed rate is 10%, the first depreciation estimate is $100 (10% of $1,000) giving an appraised value of $900; the second depreciation estimate is $90 (10% of $900), with a new appraised value of $810; the third estimate is $81 (10% of $810), with an appraisal of $729 for the asset; and so on. It is evident that a final zero valuation can never be reached (although it may be approximated) as the series becomes an indefinite or indeterminate series. If there is any scrap value, and there usually is, the series becomes determinate. From the standpoint of calculation the problem here is the determination of the fixed rate necessary to reduce the asset value to residual or scrap value in the given life-term. Using the standard notation, we may formulate the following equations:

V■ = V(1 - d); V■ = V■(1 - d) = V(1 - d)(1 - d);

V■ = V■(1 - d) = V(1 - d)(1 - d)(1 - d); whence

V■ = V(1 - d)■, which solved for 1 - d gives _____ 1 - d = ■√V■/V) , and, solving for d, we get _____ (2) d = 1 - ■√(V■/V)

While complex, the formula is readily solvable by means of logarithms. For an asset costing $150 with a service life of 5 years and a scrap value of $50, the rate is found by the above formula to be approximately 19.726%.

_____ d = 1 - ■√(50/150) = .19726

The appraisal schedule is, therefore, as follows:

=======+==============+============+=================+============== | Fixed | | | Total Age in | Depreciation | Periodic | Depreciated or | Accumulated Periods| Rate % |Depreciation| Appraised Value | Depreciation
-------+--------------+------------+-----------------+-------------- 0 | ..... | $ ..... | $150.00 | $ ..... 1 | 19.726 | 29.59 | 120.41 | 29.59 2 | 19.726 | 23.75 | 96.66 | 53.34 3 | 19.726 | 19.07 | 77.59 | 72.41 4 | 19.726 | 15.32 | 62.27 | 87.73 5 | 19.726 | 12.27 | 50.00 | 100.00 | | ------ | | | | 100.00 | | -------+--------------+------------+-----------------+--------------

The following chart shows graphically the appraised values and the accumulated depreciation:

[Illustration: _Graphic Chart—Fixed Percentage of Diminishing Value Method_]

(b) Changing Percentage of Cost Less Scrap Method

Similar in effect to the method just explained is the “Changing Percentage of Cost Less Scrap” or the “Sum of Expected Life-Periods” method. Here, the base remains fixed, but the periodic depreciation rates change. Each depreciation rate is a fraction the common denominator of which is the sum of the expected life-periods as viewed from the beginning of each successive period, and the numerator of which is the expected life for the period in question. For example, an asset of which the expected life is 5 periods has at the beginning of each successive period expected life-terms of 4, 3, 2, and 1 periods respectively, making a total of 15 which becomes the common denominator of the fractions whose numerators are 5, 4, 3, 2, and 1 respectively; i.e., the changing depreciation rates are ■/■■, ■/■■, ³/■■, ²/■■, and ¹/■■. For an asset costing $150 with expected life of 5 periods and scrap value of $50, the appraisal schedule would be as follows:

=========+==============+==============+==============+============= Age | Changing | | Depreciated | Total in | Depreciation | Periodic | or Appraised | Accumulated Periods | Rate % | Depreciation | Value | Depreciation ---------+--------------+--------------+--------------+------------ 0 | ..... | $ ..... | $150.00 | $ ..... 1 | 33■ | 33.33 | 116.67 | 33.33 2 | 26■ | 26.67 | 90.00 | 60.00 3 | 20 | 20.00 | 70.00 | 80.00 4 | 13■ | 13.33 | 56.67 | 93.33 5 | 6■ | 6.67 | 50.00 | 100.00 ---------+--------------+--------------+--------------+------------

A comparison of this appraisal schedule with that of the fixed percentage of diminishing value method shows that this method charges more depreciation during the early life-periods and less during the later periods. The general effect of this method and its significance are discussed in Chapter X where the relative merits of the various methods are considered. The graph for the sum of expected life-periods method is not shown as it differs little from that of the fixed percentage of diminishing value method on page 158.

(c, d) Arbitrary Methods

The two other arbitrary types of this variable percentage method are hardly to be classed as methods as they do not rest on any law according to which they may be operated. Under them arbitrary amounts are charged to depreciation each period, the only controlling principle being that in the one case these periodic amounts increase from period to period, while in the other case they decrease. In the one case, therefore, the appraisal schedule would be similar as to its “Periodic Depreciation” column to those of the two methods just explained, excepting that the column must be reversed, i.e., read from the bottom upward. In the other case, the appraisal schedule would be exactly similar to those just shown. Within the restriction that they must be increasing or decreasing amounts for succeeding periods and that the total depreciation must be charged off within the estimated life-period of the asset, the periodic depreciation charges are, under these methods, purely arbitrary, neither based on fact nor logic.

3. COMPOUND INTEREST METHODS

The third general type of methods for making the depreciation estimate may be called the “Compound Interest” type. This differs radically from any of the others in that it uses the compound interest principle to determine the amount of periodic depreciation. In the practical application of some of these methods, not only is depreciation estimated on this basis but an actual fund of cash or other assets is set aside for accumulation on the compound interest principle so as to provide ready funds for financing the replacement when the old asset is discarded. The setting aside of the fund is not an essential part of the method, and its discussion is therefore deferred to Chapter XXV where the subject of funds and their treatment is fully considered. Under this type there are three methods:

(a) Sinking Fund (b) Annuity (c) Unit Cost

(a) Sinking Fund Method

The problem under the “Sinking Fund” method is the calculation of the amount of a sum of money which placed at compound interest at the end of successive periods will accumulate to the amount of the total depreciation of the asset during its life-term. At the end of each period, this amount plus any accumulated interest on the amounts previously set aside becomes the depreciation estimate for this period. Unless a fund is actually established, there can, of course, be no accumulation of interest. Under this

method the amount of such theoretically accumulated interest is, nevertheless, made a part of the periodic depreciation charge.

The method thus becomes simply a mathematical device for making the estimate. The calculation of the fixed periodic amount is in accordance with the following mathematical formula, using the notation given on page 151. The development of this formula is given in full in Chapter XXV, “The Sinking Fund”:

(V - V■)r Dr (3) A = --------- = ------ R■ - 1 R■ - 1

For the asset used in the other illustrations, i.e., for an asset with a full valuation at the beginning of its life of $150 and a residual value of $50 after a service life of five years, this periodic amount is $18.10, if interest is reckoned at 5%. Any other rate of interest within reason would, of course, be equally appropriate.

The following appraisal schedule may be set up:

=======+==================================+============+============ |Periodic Depreciation Composed of:| | Age in +----------+----------+----------+Depreciated | Total Periods| Periodic | Interest | Total |or Appraised|Accumulated | Amount | | | Value |Depreciation -------+----------+----------+----------+------------+------------ 0 | $ ..... | $ .... | $ ..... | $150.00 | $ ..... 1 | 18.10 | .... | 18.10 | 131.90 | 18.10 2 | 18.10 | .90 | 19.00 | 112.90 | 37.10 3 | 18.10 | 1.85 | 19.95 | 92.95 | 57.05 4 | 18.10 | 2.85 | 20.95 | 72.00 | 78.00 5 | 18.10 | 3.90 | 22.00 | 50.00 | 100.00 | | | ------- | | | | | $100.00 | | -------+----------+----------+----------+------------+------------

The following chart shows graphically the appraised values, the accumulating depreciation and the elements which compose it, the curve OD representing the fixed periodic amounts, and EF the theoretical interest accumulations. The curve OD is a straight line inasmuch as it represents fixed periodic amounts. The depreciation and interest curves, OC and EF, representing gradually increasing amounts, are both slightly concave and would become increasingly so the longer the period covered. The appraisal curve AB is slightly convex and its convexity is accelerated by lapse of time.

[Illustration: _Graphic Chart—Sinking Fund Method_]

(b) Annuity Method

The “Annuity” method also makes use of the compound interest principle, but in addition to the method of the sinking fund it adds to the periodic depreciation charge as determined thereunder interest on the successive appraised values of the asset. The effect of this is to charge to the product, by way of Profit and Loss, interest on the capital invested in each asset used in manufacture. The appraised values of the asset are exactly the same as under the sinking fund method, but the expense charge to depreciation is larger under the annuity method by the interest on the appraised value of the asset. This charging of interest to the product under the title “depreciation” makes it necessary to capitalize the interest charge by adding it to the value of the asset. If the amount to be charged off, i.e., V-V■ is the same under both methods, for both to arrive at the same scrap value, V■, the interest under the annuity method must be added to the value of the asset each time before deducting the depreciation charge, a part of which is this same interest. The annuity method thus makes a larger periodic charge than the sinking fund method.

The problem involved in the calculation of the periodic depreciation charge by the annuity method is sometimes stated as the method of finding a fixed or constantly equal periodic charge sufficient to charge off not only depreciation as such but also the interest which has been added to the value of the asset. The mathematical formula may be derived as follows, using the standard notation:

VR = V(1 + r), or the asset with interest added to it

VR - D■ = V■, appraised value at end of first period

V■R - D■[31] = VR² - D■R - D■ = V■, appraised value at end of second period

V■R - D■[32] = VR³ - D■R² - D■R - D■ = VR³ - D■(R² + R + 1) = V■, appraised value at end of third period, etc.

[31] Inasmuch as by hypothesis the periodic depreciation charges are the same D■ = D■ = D■ etc., hence, D■ is used to represent the fixed depreciation charge per period.

[32] Inasmuch as by hypothesis the periodic depreciation charges are the same D■ = D■ = D■ etc., hence, D■ is used to represent the fixed depreciation charge per period.

Generalizing, we have:

V■■■R - D■ = VR■ - D■(R■■[1] + R■■[2] ... + R² + R + 1) = V■,

scrap value. Whence

R■ - 1 VR■ - V■ = D■ -------. Solving for D■; we have: R - 1

(VR■ - V■)(R - 1) (VR■ - V■)r (4) D■ = ----------------- = ----------, R■ - 1 R■ - 1

= periodic depreciation charge

That this is the same as the amount of the periodic depreciation charge by the sinking fund method plus interest on the investment, is seen by comparing formula (4) with formula (3). Formula (4) may be written as

(VR■ - V■)r + Vr - Vr ---------- , R■ - 1

i.e., the quantity Vr-Vr = 0 is put into the numerator. Adding zero (Vr-Vr = 0) cannot change its value. Performing the multiplication indicated by the parentheses, we have

VR■r - V■r + Vr - Vr ---------- . R■ - 1

Rearranging the terms, we have

(Vr - V■r) + (VR■r - Vr) ----------, R■ - 1

which factored in each group becomes

(V - V■)r Vr(R■ - 1) -------- + ---------- . R■ - 1 R■ - 1

By reducing the second fraction, this may be written as:

(V - V■)r (5) --------- + Vr R■ - 1

which is seen to be identical with formula (3) for the sinking fund except for the addition of Vr, which represents interest at r% on the investment V. The identity of the annuity formula (4) with the sinking fund formula (3) plus interest on investment can be established similarly for any of the periods.

It will be noted that by the annuity method the whole original value of the investment is always earning interest either in the sinking fund or in the diminishing appraised value. Thus, the portion of original value deducted each period earns interest in the sinking fund, while what is left as appraised value earns interest outside the fund. Thus, the annuity method of charging depreciation may be said to consist of two parts, viz., the fixed periodic amount and interest on the original investment. This will be seen from the appraisal schedule which follows. The same illustrative data are used as before, including interest at 5%.

=========+===+ | Periodic Depreciation Charge | | Composed of: | +--------+----------+------------+---------+ | | | | Age in | | Interest | Interest | | Periods | Fixed | on | on | Total | | Amount | Fixed | Investment | Charge | | | Amount | | | | | | | | | (a) | (b) | (c) | (d) | ---------+--------+----------+------------+---------+ | | | | | 0 | $..... | $.... | $..... | $..... | 1 | 18.10 | | 7.50 | 25.60 | 2 | 18.10 | .90 | 6.60 | 25.60 | 3 | 18.10 | 1.85 | 5.65 | 25.60 | 4 | 18.10 | 2.85 | 4.65 | 25.60 | 5 | 18.10 | 3.90 | 3.60 | 25.60 | +--------+----------+------------+---------+ | $90.50 | $9.50 | $28.00 | $128.00 | ---------+--------+----------+------------+---------+

=========+===========+==============+========================= | | | Accumulated | | | Depreciation | | +----------+------------ | Appraised | Depreciated | | Age in | Value | or Appraised | | Periods | Plus | Value | Including | True | Interest | | Interest | Depreciation | | | | | | | | | (e) | (f) | (g) | (h) ---------+-----------+--------------+-----------+------------ | | | | 0 | $..... | $150.00 | $..... | $..... 1 | 157.50 | 131.90 | 25.60 | 18.10 2 | 138.50 | 112.90 | 51.20 | 37.10 3 | 118.55 | 92.95 | 76.80 | 57.05 4 | 97.60 | 72.00 | 102.40 | 78.00 5 | 75.60 | 50.00 | 128.00 | 100.00 | | | | | | | ---------+-----------+--------------+-----------+------------

It will be noted, as stated above, that the sum of the two interest items in columns (b) and (c) is the same for each period, viz., $7.50, interest on the _original_ investment. The total of column (d), total charge for periodic depreciation, minus the total of column (c), interest on the diminishing appraised values, gives $100, the true depreciation as shown by column (h). _True_ depreciation

under the annuity method is the same as under the sinking fund method. The periodic depreciation charge differs, however.

A graphical illustration of the main items of the appraisal schedule is shown below:

[Illustration: _Graphic Chart—Annuity Method_]

In the above chart the points A^1, A^2, etc., represent the appraised values plus interest, the segments, A^1I^1, A^2I^2, etc., representing interest on each period's investment. It is to write down these increases in value that the additional $28 of periodic depreciation charges is needed. The curve OC is a straight line since each period's depreciation charge is the same. Curves AB and OD are identical with those of the sinking fund method. Curve OE represents the accumulating interest on investment as shown by the segments A^1I^1, A^2I^2, etc. Curve OC is the sum or resultant of curves OD and OE.

The annuity method is termed the "Equal Annual Payment" method in a preliminary report of the Valuation Committee of the American Society of Civil Engineers. As here illustrated it does bring about an equal periodic charge but only because the assumed rate of interest for the sinking fund accumulations is taken also as the rate for interest on the investment. If these two rates differ, the periodic charges will also differ. For example, if the sinking fund rate is taken as 5% and the rate applicable to the appraised values is 8%, the sum of these two interest amounts will not be constant because the bases on which they are calculated are changing each period. Because of this fact the Committee above referred to called this the "Compound Interest" method in its final report. To distinguish this from the sinking fund method which also uses the compound interest principle, the title here adopted, i.e., the "Annuity" method seems to accomplish that purpose.

(c) Unit Cost Method

A third method which uses the compound interest principle is called the "Unit Cost" method. Because of the involved mathematical processes required for the calculation of the amount of its periodic charge, and the doubtful practical value of the method, only a description of its main features will be given here.[33] The aim of this method is to equalize over each unit of product three costs, viz.: the cost of interest on investment, the cost of operation and repairs, and the true depreciation cost, all of these to be included in a periodic charge under the title of "depreciation."

[33] The interested student is referred to Proceedings—American Society of Civil Engineers—December, 1916, in which will be found the Valuation Committee's report, and to Salier's "Principles of Depreciation," in both of which the formula is developed.

The calculation of the true depreciation cost by the sinking fund principle is the reason for including this method in the compound interest type. The problem to be solved is the determination of the price to be paid for an asset at a given time so that the cost of each unit of product turned out during its remaining service life shall be the same as the cost of each unit of product turned out during the spent portion of its service life. The difference between the original cost of the asset and the price determined as above will be the depreciation of the asset for the elapsed period. A symbolic showing of the problem will make the matter clear. The following notation will be used:

V = original cost of the asset installed ready for use V■ = price that could be paid for it at the end of the period as above explained O = estimated average operating costs per period, including repairs, for V o = estimated average operating costs per period, including repairs, for V■ D[34] = true depreciation rate or multiplier under the sinking fund method, for V d[35] = true depreciation rate or multiplier under the sinking fund method, for V■ U = units of output for V during one period u = units of output for V■ during one period r = rate of interest on the investment

[34] D and d may be expressed as the respective periodic amount-multipliers necessary to create sinking funds of one dollar each under the conditions as to time and rate for V and V■. VD and V■d become, therefore, the periodic amounts of true depreciation, i.e., decrement in value.

[35] D and d may be expressed as the respective periodic amount-multipliers necessary to create sinking funds of one dollar each under the conditions as to time and rate for V and V■. VD and V■d become, therefore, the periodic amounts of true depreciation, i.e., decrement in value.

Then:

$$\frac{O + DV + Vr}{\text{----------}} = \text{the cost per unit of output for V, U}$$

o + dV■ + V■r ---------- = the cost per unit of output for V■. u

Since, by hypothesis, these two costs are to be equal, we may form the equation

O + DV + Vr o + dV■ + V■r ---------- = ----------, U u

which solved for V■, the price to be paid, gives

u ( ) --- (O + DV + Vr) - o U ( ) V■ = ---------- . (d + r)

Evidently, V-V■ is the amount of the depreciation charge. The values for D and d, as indicated in the footnote, may be substituted and the amount of V■ determined. The process is somewhat complicated in its practical application and will not be carried further here.

4. MISCELLANEOUS METHODS

Other methods of calculating the depreciation charge are used, but they cannot be classified under any of the three groups discussed so far. They are a miscellaneous, mongrel breed, scarcely to be dignified in some instances as methods. Among these may be mentioned the following:

(a) Maintenance Method (b) Replacement Method (c) Fifty Per Cent Method (d) Appraisal Method (e) Insurance Method (f) Gross Earnings Method

(a) Maintenance Method

In this case a periodic charge for depreciation is made, equal in amount to the cost of maintenance of the asset for the period. It is thus a definite but variable amount, depending upon the maintenance policy.

(b) Replacement Method

This is hardly a method of _calculating_ the depreciation charge, but rather of recognizing the fact of depreciation by charging all renewals and replacements to revenue. It is argued that in a large, widely extended plant after depreciation has reached the point where renewals are necessary, the charging of all renewals and replacements as expenses will take care of all accruing depreciation and secure a fairly uniform charge to product from period to period. Under this plan depreciation as such does not appear on the books but is taken care of under other titles.

(c) The Fifty Per Cent Method

This is somewhat similar to the replacement method in that it is applicable only after depreciation has reached the renewals stage. It is claimed for it that, in a property or class of asset consisting of many similar parts, as railroad ties, for example, after the stage of normal repairs has been reached so that the parts are in all degrees of repair from 0% to 100%, the normal maintenance and renewals policy will maintain the property or asset always in about 50% condition. Therefore the total depreciation for the asset or class is the other 50%, which never reaches a larger amount because of a constant renewal of parts. This 50% depreciation may or may not be carried on the books but it exists nevertheless. For the conditions under which it is applicable as above, the law of averages doubtless applies and makes the estimate a fairly good one.

(d) Appraisal Method

Here a physical appraisal of the asset or property is taken at the close of every fiscal period. The difference in value between the two appraisals for successive fiscal periods represents the depreciation for the period and would be brought on the books as such.

(e) Insurance Method

This is applicable only to large properties with assets widely distributed. Its operation “involves the actuarial principles of ordinary insurance. This means that the fund accumulated by depreciation charges should not be reserved as an accumulation until it can be spent for the purpose of replacing the identical property upon which the fund accumulated when such property is abandoned; and furthermore, that this fund should be expended, in whole or in part, during the year in which it is created, in the replacement of equipment.”

(f) Gross Earnings Method

Here the depreciation estimate is based on the gross earnings for the period. This does not necessarily mean that the depreciation estimate will be large when profits are large, and small or nothing when profits are small, although it may be made to apply in that way in individual cases. The policy of making ample reserves for depreciation in good years and scant reserves in poor years is not to be wholly condemned. Depreciation, however, has no relation to, or dependence upon, profits. Rather, profits depend on depreciation in the sense that they cannot exist until after charges for depreciation have been taken care of. Depreciation considered as a fixed per cent of gross earnings is almost the same in effect as the service output method, and has much to commend it.

Condition Per Cent

Before leaving the topic of method, it may be well to explain a term used in connection with the depreciation estimate, viz., condition per cent. The condition per cent of an asset is found by subtracting from 100%, the fraction which represents the ratio of the present accumulated depreciation to the total estimated depreciation. Thus, if an asset has depreciated in value one-quarter, its condition per cent is said to be 75 (100%-25%). Hence, condition per cent is easily calculated if depreciation has been estimated by any of the proportional methods. If, in addition to the standard notation used, we assume that:

D■ = total amount of depreciation for m periods V■ = value of the asset at end of m'th period

then, in general, condition per cent may be expressed by the formula:

D■ (6) 100% - ---- D

Evidently, therefore,

(D■) V■ = V(100% - ----). (D)

Under the proportional methods D■/D = nd. Therefore, condition per cent is 100%-nd.

Under the sinking fund method, the calculation is more complex. D■, the total amount of depreciation accumulated to date, i.e., after m periods, is the amount of the annuity A for m periods. From formula (3), Chapter XV, page 272, the amount of an annuity A is seen to be

A(R■ - 1) ---------- . r

A(R■ - 1) Therefore, D■ = ---------, r

A(R■ - 1) and D = ---------, r

from which the ratio

A(R■ - 1) --------- D■ r R■ - 1 --- = ---------- = -------- . D A(R■ - 1) R■ - 1 --------- r

Accordingly, condition per cent under the sinking fund method is:

R■ - 1 (7) 100% - -------- . R■ - 1

CHAPTER X

DEPRECIATION—APPRAISEMENT OF THE VARIOUS METHODS

General Considerations

No method of estimating depreciation will ever be devised which will be applicable under all conditions and to all kinds of property. Such a panacea for the ills of wasting assets can obviously never be found, for the very good reason that the same medicine will not suit all patients. What gives good results in one case may not be applicable or not equally so, in another case. In discussing the relative merits of the various methods, therefore, no dogmatic rules for their use can be laid down; furthermore, without a detailed knowledge of operating conditions, only their main points of strength and weakness can be pointed out, and this is all that will be attempted here.

In a critical discussion of methods and their effects, the fact of depreciation may be considered from either the viewpoint of time or service. Depreciation when viewed from the aspect of time may be said to be due to:

1. Decrepitude, which is merely the lapse of time.

2. Inadequacy, which is lack of capacity to do the work which increasing markets demand (a condition the essence of which is also time).

3. Obsolescence, which represents the inability to perform efficiently as compared with the service secured from more modern equipment, and which may be a condition brought about by lapse of time and the developments of an art or science.

When viewed from the aspect of service, depreciation may be due primarily to wear and tear, which is a condition directly dependent upon the service rendered.

It has been pointed out that these elements of depreciation, viz., wear and tear, inadequacy, obsolescence, etc., are single and isolated in their action and not cumulative. One of them, therefore, is the controlling element in any estimate of depreciation. Accordingly, in judging the merits of a method the kind of depreciation must be taken into account; i.e., depreciation must be viewed from a time and service standpoint.

Ideal Basis for Distribution of Depreciation Charge

Regardless of the actual progress of depreciation, the theoretically ideal method of distributing the charge, from the standpoint of a going concern, is so that each unit of output shall bear its just proportion of the burden. Any other attitude is inconsistent. Thus, assuming that actual depreciation does not progress uniformly, that, as some maintain, the rate of depreciation is heaviest towards the end of the service life of an asset, it would not be equitable to charge the product of those years with a much higher burden than that of the earlier years. Just as it is a misfortune to be born under some conditions, so here it would be a misfortune to a commodity to be produced during the latter years of the service life of an asset. The life-period of an asset must be viewed as a whole and its total depreciation should be distributed evenly over its output, if equity is to be secured—other conditions, of course, remaining the same. This principle does not apply alone to the depreciation charge but equally to all other charges in connection with the asset, such as repairs, maintenance, etc. The author does not believe that these other costs should include a charge for an assumed rate of interest on the money invested in the asset. For a full consideration of the question of interest on capital as an item of cost of production, the student is referred to Chapter XXVI. Any method of distributing the depreciation cost must take cognizance of the other costs as well.

1. PROPORTIONAL METHODS

(a) Straight Line Method

The straight line method is, first of all, simple in application and can easily be adapted to any asset under almost any conditions. Partly because of the ease of calculation and application, it has been designated as an official method by many regulatory boards. Its basis is a time basis and it spreads the charge evenly over the periods of the service life of the asset. Accordingly, where the time elements of depreciation, viz., decrepitude, inadequacy, or obsolescence, control and where the output does not fluctuate much from period to period, the straight line method should give satisfactory results for its intended purpose, i.e., for allocating the real depreciation charge.

Its effect, however, must be considered also in conjunction with the distribution of the other costs connected with the asset. Many engineers maintain that repairs are light during the early life of an asset and heavy during the later years. If this is true and these costs are charged to the period in which they are incurred, the combined depreciation and up-keep costs place an unjustly heavy burden on the output of the later years. Almost equally good authority maintains that the cost of repairs is in no sense uniformly graduated as implied above but can be counted upon in practice to be extremely irregular. If this is true and up-keep costs are charged as above, then many periods are apt to be underburdened and others loaded too heavily.

While, however, these considerations must be given weight when a single asset is under view, in a large plant after operation has continued to the point where a normal and fairly regular cost of up-keep has become established, the inequalities of the individual up-keep charges may merge into fairly equal charges for the up-keep of the plant as a whole. This the law of averages accomplishes to a greater or less degree. But in a small plant with few assets subject to depreciation, the equality of the whole

might not result from the individual inequalities. After all, this magic rule of averages which is invoked to cover up many troublesome and embarrassing situations is obnoxious to scientific accounting; it is a makeshift which carries with it a shiftless trust in the happy outcome of things—a trust which has been so often betrayed as to carry little weight.

If depreciation costs can be predetermined with a satisfactory degree of accuracy—and an estimate of them is all that can ever be made—with equal accuracy and satisfaction can up-keep costs be predetermined. The one is no more difficult than the other and equal reason exists for predetermination in both cases, viz., the securing of an equitable distribution of costs. With both estimates made at the beginning of the service life of the asset, all costs in connection with the asset can thus be prorated over the years of its service life.

If, as stated above, the output is fairly regular as between periods, fair and equitable results will be obtained. If the output fluctuates violently, unsatisfactory costs and an inequitable burdening of product will be the result. The proper treatment of overtime and "beyond-capacity" work, i.e., abnormal operations, requires care. It is expected that such work will have a higher unit cost than normal output, and it is proper that a sliding scale of depreciation be applied in such a case.

(b) Working Hours Method

Most of the considerations taken into account for the straight line method are equally applicable to the working hours method. Here, with the service life expressed in terms of working hours instead of fiscal periods, a far step has been made towards securing an equitable distribution of depreciation costs over product. The rate per working hour can in this way be applied directly to the product. The machine-hour and sold-hour methods of costing distribute the depreciation along with all other costs on this basis of "rate per working hour."

Where a machine or other asset is limited in its use to a few operations equally wearing in their effect, this method should give satisfactory results. Where, however, one asset can be used for many different processes, involving inequalities in wear and tear, if the service rendered is the controlling factor, an inequitable distribution will result. Similarly, beyond-capacity operation, i.e., operation beyond the normal speed at which depreciation cost has been predetermined, will not be taken care of automatically by this method. Adjustment is necessary and, though arbitrarily made, must be attempted. Thus, ten articles might be turned out in one working hour, whereas an estimated output of six formed the basis for determining the rate of depreciation per working hour. As with the straight line method, so here equal care must be exercised in securing an equitable distribution of up-keep costs.

(c) Composite Life Method

This is not a working method for estimating individual depreciation costs, but rather a method of proof or check, which proves very valuable in some cases. The method is discussed in detail on page 197 where the uses to which it may be turned are pointed out.

(d) Service Output Method

The service output method bases the depreciation cost not on years of life nor on life in terms of working hours of service. Here an attempt is made to predetermine the output of the asset in terms of units of product, and so burden every unit with its fair share of depreciation. To secure full equality of charges, up-keep costs must be reckoned on the same basis, rather than on a time basis of service hours or length of life. If conditions are uniform and normal, this method, where applicable, secures perhaps the most satisfactory of all allocations of depreciation costs. To an individual machine performing several different processes the method would scarcely be applicable. To a group or battery of machines, turning out a uniform product in finished form or in the same degree of partly finished condition, the method could be well applied. The estimated total output of the group would then be taken as the basis for calculating the service output of each machine in the group. When calculating service life in whatever units, that speed of operation which secures the highest efficiency is taken as the figure of normal operation.

From the foregoing it follows that the service output method of calculating the depreciation charge per unit of output is well adapted to an inherently wasting asset, such as a mine, a quarry, and timber lands, and is almost invariably applied in such cases.

2. VARIABLE PERCENTAGE METHODS

(a) Fixed Per Cent of Diminishing Value Method

The chief merit of the variable percentage methods, in the eyes of their advocates, is the way they are automatically adjusted to the up-keep charges. The reader should study the graphs of these various methods as a means of comparing results.

On the graph, page 158, it is shown that under the fixed per cent of diminishing value method the periodic depreciation charges are heavy in the beginning and decrease toward the end. It is argued that, inasmuch as up-keep costs increase as the depreciation charge decreases, this method automatically equalizes these two costs. This argument was examined in detail under the previous discussion of the straight line method. What was there set down applies equally here. The fixed per cent method is also based on service life by periods—a time basis rather than a service or output basis. Furthermore, it involves a complex calculation and is perhaps never applied with any degree of accuracy. Lawrence R. Dicksee prefers this method for handling depreciation on machinery.

(b) Sum of Expected Life-Periods Method

The objection of complexity of calculation to the method just discussed is overcome largely in the sum of expected life-periods method. Here the rate of decrease is more marked, but the method has the same general effect as the fixed per cent method. If the repair charges are handled, as suggested, by means, of pre-estimates, the results will not be equitable. If repairs increase with uniform regularity as the depreciation costs decrease, fair equality is secured. Otherwise the method has little to commend it.

(c, d) Arbitrary Methods

The two other methods under this main group, viz.: arbitrary with increasing amounts in the one case and decreasing amounts in the other, are not based on any orderly scheme of calculation and, having little logic behind them, are not to be relied upon. Ease of calculation is perhaps their only merit.

3. COMPOUND INTEREST METHODS

General Considerations

In a discussion of compound interest methods the basic feature, that of the compound interest principle, requires consideration. The thought of progression on a compound interest basis is fascinating to many. It is a powerful instrument of accumulation and its charm seems to lie in the fact that through its instrumentality small sums can be made to grow into large sums. Whether the principle is applied to the creation of a fund or simply as a method of _calculating_ periodic amounts, the remarks of P. D. Leake,[36] an English authority, are equally appropriate. He says: “May I impress upon you that these devices are dangerous expedients in any but the most skillful hands.... It (the sinking fund) is apt to give a sense of false security, because its whole virtue depends upon its obligations being faithfully carried out over the whole period, and this condition is not always fulfilled.... It is probable that in many cases the use of a sinking fund is an altogether unwarrantable draft upon the future, because there is no reasonable certainty that the fund, whether it be state, municipal or commercial, will not be raided before it attains its object.”

[36] In “Depreciation and Wasting Assets.”

Over short periods the difference between the periodic amounts under this method and the straight line method is slight, as will be apparent from a comparison of the two charts on pages 153 and 162, giving graphic illustration of the two methods. There the period is for five years. When the period is extended to, say, twenty or fifty years, the difference in burden, due to interest accumulations, between the early years and the later years is very marked. “Thus, a 10-year unit having no salvage value, loses half its value in 5 years under the straight line theory, regardless of the rate of interest, and at 5% under the compound interest theory it loses nearly as much—about 44% of its value in the same time; ... but a 50-year unit, losing half its value in 25 years, under the straight line theory, loses only 22.8% of its value, at 5%, under the compound interest theory.”

(a) Sinking Fund Method

The sinking fund method as an orderly scheme for estimating the periodic depreciation charge _will_ make the estimate, and, if adhered to faithfully, the entire depreciation will be written off by the end of the service life of the asset. In this respect it is to be preferred to any arbitrary or haphazard method. That it secures an equitable distribution of depreciation costs over the product of the various periods, or that it effects a correct valuation of the asset at intermediate periods of its life is open to serious questioning. The periodic charge under the sinking fund method perhaps bears no relation to the fact of depreciation. The method is, at the best, simply a mathematical device for an orderly calculation of periodic amounts. In the valuation work of public service companies or in

regulation work where, as in California, actual funds must be set aside to accumulate at compound interest, there is no serious objection to the method. Although it rests on false or doubtful assumptions of fact and results in an inequitable burden on the product as viewed from the standpoint of individual assets, these are minor considerations; for the method does by the end of its service life take care of the loss in value. Judged from the standpoint of its relation to up-keep costs, the method lays an increasingly heavy burden on the later years of the life of the asset.

(b) Annuity Method

All that has been said with regard to the sinking fund method applies with equal point to the annuity method. As previously indicated, in the explanation of its essential features, this method automatically secures a charge for interest on the investment as a part of the depreciation charge. Not only is the charging of interest of doubtful propriety in itself, but certainly its inclusion under the title of depreciation is misleading and indefensible. The courage of one's convictions with regard to interest as a part of cost should not allow interest to shelter itself under the cloak of "depreciation." By referring to the appraisal schedule and chart, it is seen that the real depreciation charge is exactly the same under the annuity as under the sinking fund method.

(c) Unit Cost Method

The unit cost method represents an attempt to secure an equal burdening of each unit of product with interest, depreciation, and operating costs. In the language of its proponents, "this theory is probably the soundest theory of depreciation, and when applied with intelligence, probably furnishes the truest measure of accrued depreciation." While the end sought by the unit cost method is commendable, it is a compound interest method and it mixes interest, up-keep, and depreciation under the one title "depreciation."

4. MISCELLANEOUS METHODS

Criticisms of the miscellaneous theories can be brief.

(a) Maintenance Method

This method is irregular in its incidence, and under it the depreciation charge fluctuates violently between periods. Just as maintenance is subordinated to the requirements and demands of the trade, so also are depreciation costs made to depend on the same conditions. The charging of depreciation thus becomes a matter of business convenience instead of an inexorable fact of production. Just as repairs are postponed to a slack period during which maintenance charges are in consequence heavy, so does the depreciation charge increase even though actual wear and tear has decreased. Presumably the method makes charges light during the early years and heavy during the later years of the life of the asset. In a large plant with various kinds of assets, after a normal up-keep charge has been established, the maintenance method of estimating the periodic charge for depreciation for the plant as a whole may work out fairly well on the theory of averages or by accident; for maintenance is not a measure of depreciation.

(b) Replacement Method

This is not a method of measuring depreciation but rather of financing it, i.e., of making good the loss. It also is based on the law of averages, and in a large plant after the point of normal replacements has been reached it may prove a satisfactory method of accomplishing its purpose. It does not serve as a means whereby a periodic depreciation charge can be brought on the books. Furthermore, it disregards the depreciation accrued up to the point of normal replacements.

(c) Fifty Per Cent Method

This method is also based on the law of averages. Here the law is very apt to work out satisfactorily. When the point of normal replacement of the assets, to which the 50% method is applicable, has been reached, the amount of depreciation is approximately 50% of the original value of the group of assets. This amount may be booked at that time and will remain without change thereafter, for the assets are maintained constantly in that condition. As a means of valuation, the method may serve well; as a measure of periodic depreciation or as a means of distributing the depreciation cost over the product, it is inadequate.

(d) Appraisal Method

This method is also inadequate as a means of measuring the periodic cost of depreciation. The physical facts of depreciation are not usually discernible at such short intervals. A judgment of values must, therefore, almost invariably make use, consciously or unconsciously, of some of the other methods of estimating the amount of depreciation by periods. After all, all methods of measuring depreciation are appraisals. Under the appraisal method confusion between original cost and reproduction cost is almost certain to occur, for present market values usually control physical appraisals. A discussion of the relative merits of original cost and reproduction cost as a proper basis for estimating depreciation will be presented in Chapter XI.

(e) Insurance Method

This method of carrying the depreciation charge is analogous to the policy practiced by some concerns of taking care of their fire losses by carrying their own insurance. If physical conditions are such as to make such a policy advisable or prudent, it should work out satisfactorily. It should be noted, however, that the insurance method is a means of providing funds for financing replacements and renewals rather than a method of insuring an equitable distribution of the depreciation cost over the product. The method of providing funds does not need to be the same as the method of measuring the periodic cost of depreciation. The insurance method serves the former purpose but is not well adapted to the latter. Much of the criticism of the sinking fund method is here applicable.

(f) Percentage of Gross Earnings Method

Measuring periodic depreciation as a percentage of the period's gross earnings is a convenient and fairly satisfactory method under some conditions. If the principal element is wear and tear—a service factor rather than a time factor—output may have a very direct relation to gross earnings. If the commodity dealt in is a standardized product and its price does not fluctuate to any extent or, better still, is fixed, gross earnings will be a very fair measure of output. It is true that the estimate is based on a sales valuation of output rather than its cost of manufacture, but under some conditions this is a good measure of relative output as between periods. A depreciation charge based on gross earnings may thus give an equitable distribution of the depreciation burden. In the case of public utilities, when the price of the commodity or service dealt in is fixed, an estimate based on gross earnings usually gives satisfactory results where used. In applying the method, the expected earnings during the composite life-period of the plant are estimated and depreciation costs are then prorated over periods on the basis of earnings for the period as compared with total earnings for the composite life-period; or more simply, a fixed percentage based on past experience can be applied to the earnings of each period. Some objections to the method, arising in some cases from a misunderstanding of its operation, were pointed out when an explanation of its working was given.

In some cases gross earnings bear no relation, or only the remotest, to the quantity of output or the units of service rendered. A depreciation estimate based on earnings would not in that case be logical and could not give satisfactory results.

From the above discussion of some of the merits and shortcomings of the various methods, the cogency of the introductory remarks, to the effect that no method of measuring depreciation can serve as a panacea, should be appreciated. Every depreciation problem is more or less an individual problem; sweeping generalities will not serve.

Effect on Return on Investment

Many interesting studies have been made of the effect of some of the above methods on stability of income as between periods and their effect on the return of the investment, using hypothetical data as to the earnings of the depreciating asset. Except for the purpose of fixing rates in the case of public service corporations, where the public has an interest because of the monopoly granted, stability of income should be subordinated to the fact of depreciation and not serve as a test of the merit or demerit of a method.

CHAPTER XI

RECORDING DEPRECIATION ON THE BOOKS

Methods Commonly Employed

Two methods of booking depreciation in the ledger are commonly employed. The periodic adjusting entry on account of depreciation has as its basic purpose the separation of the mixed account under asset title into its two elements—the one to show the expense element, the other to set up the true valuation of the asset. The expense element is set up under the one title

“Depreciation” for all the assets. The deduction from the values as shown in the unadjusted asset account may be made either by credit entry direct to the asset account or by entry to a separate “Depreciation Reserve” account, each one of these reserves distinguished by the name of the asset to which it applies.

The latter method is preferred because thus the asset account at any time shows the original cost of the property—information of value for many purposes and worth the effort needed to maintain it distinct from other items. Under this method every wasting asset account is immediately followed by its particular depreciation reserve account, called its “valuation” account. The depreciation reserve is as much a part of the record of the asset as is the asset account itself. The two accounts are complementary, neither giving reliable information without the other. The reserve account is thus always and only a balance sheet account.

The above statement indicates the most satisfactory method of handling the various depreciation reserve accounts on the balance sheet. Although appearing on the credit side of the ledger, they are in no sense liability accounts, being interpreted always as credits to the asset account, held in suspense, as it were, in the reserve account, pending full determination of their accuracy, which governs their ultimate disposition. Thus, on the balance sheet, either only the net present value of the asset should be shown, or preferably its original cost with its value extended short, its depreciation reserve deducted, and the present value, thus determined, full-extended. Further information of some value is given if besides the amount of the reserve the rate of depreciation is shown, though this is not often done. Occasionally an entirely incorrect showing, from the viewpoint of strict form, is seen when not only are the depreciation reserves—usually in one item—shown on the right side of the balance sheet but are set up in the Net Worth section, seemingly as a part of the surplus or other true profit reserves. This practice cannot be justified on any ground except that the sheet is kept in balance—a consideration which is far removed from real essentials.

Renewals and Replacements

First Method. As to the handling of the reserve at the time of renewal of parts and replacement of the entire asset, here also two methods are met. Under the one, the original cost of the part (or whole) retired is transferred from the asset account, its salvage value as defined above being carried to a Salvage account, and the cost less salvage portion being charged to the reserve account of the asset. This clears the asset account of all capital charges on account of the part (or whole) retired. The new part (or whole) replacing it is now charged to the asset account which then represents true cost of the new asset. If it is a whole which is replaced, theoretically the charging of it against the reserve should just clear that account of all values. Practically the preliminary estimate or forecast of the amount and time of depreciation never coincides exactly with the fact of depreciation. A credit balance in the reserve indicates an overallowance for depreciation and is an item of true reserved profits, i.e., surplus; whereas a debit balance indicates an insufficient allowance and is an expense item chargeable against surplus and not _current_ profits. This matter is treated at greater length on page 205. When the whole asset is replaced, the depreciation reserve should always be cleared of any remaining balance, as indicated above, so that the new asset and its depreciation allowance may be handled and watched unobscured by the record of any inherited sins or virtues from the past.

Second Method. The other method of handling the reserve at the time of replacement requires a comparison of the cost of the displaced asset and the cost of the new asset. The old asset account is allowed to stand untouched, but any betterment, i.e., excess of reproduction cost over original cost, is charged to it so that the asset account may show cost of the new asset. This cost, except for its betterment portion, if any, is now charged against the reserve. Both methods thus accomplish the same purpose, but the first is more direct and simpler of operation. It may be interesting to note that, in early instructions to railway accounting officers, the Interstate Commerce Commission prescribed the second method, which emphasizes the betterment feature. The present regulation is in accord with the first method.

Occasionally one finds a practice which, though based on the second method, differs in that no determination of betterment values is made, the original asset values remaining undisturbed and the entire reproduction cost being charged against the reserve account. This practice, of course, is due to a lack of understanding of the nature and purpose of the depreciation charge and its offsetting reserve, and is counter to correct principles. There is, however, seeming judicial support for it in cases of the valuation of utility properties for rate purposes. The problem is discussed in full on page 202. The entries on the general books thus present no difficulties.

Subsidiary Records

Subsidiary records should usually be kept to show the detail of the group asset accounts carried on the general ledger. Not only is this necessary to maintain an adequate check on the inventory of the group asset and control over it, but without a detailed record of items it is impossible to keep careful watch over the operation of the forces of decay and depreciation and, therefore, equally impossible to build up reliable experience data concerning each group of assets. The amount of detail necessary in the record of the plant assets is dependent upon the information desired and capable of being obtained within a limit of cost low enough to make it worth the cost. This is a matter of policy which the management must determine. It may be desirable to carry the records in much greater detail for a period than would be justifiable as a permanent policy. It may be worth while to make more or less frequent studies of particular groups of assets in order to check up the effect of the depreciation rates.

As is pointed out elsewhere, while the preliminary estimate of expected life, and determination therefrom of the depreciation rate, are of great importance and the utmost skill and judgment possible should be employed, only a policy of everlasting vigilance and readjustment, in the light of new data available with the increasing age of the asset, will bring satisfactory results. To predetermine a rate and then to expect it without supervision to work out to a successful conclusion is, to say the least, foolish. Only by means of a complete record of life histories can a mass of reliable data be built up which can be made to serve as a guide for the future. The depreciation problem is an individual problem and must, from the nature of things, remain so to a marked degree. Until conditions under which the lives of assets are to be lived become more or less standardized, or so long as each concern must carry its own depreciation insurance, standard rates of depreciation will not have a controlling significance.

Grouping and Classification of Plant Assets

From what has been said it is evident that the assets of a plant must be divided into groups for the sake of simplicity and convenience in keeping record of them. The basis of grouping should be physical similarity, process, or product. Thus, all tram cars might be carried in a group, as also all machines doing the same work or process. Groups of machines performing different processes on the same product could well be treated as a depreciation unit, and likewise all buildings used for the same purpose, if of a similar type of construction. If the latter are of different types it might be desirable to keep separate records. As stated above, the information desired must govern the groups under which record of behavior and performance are kept.

A numerical or an alphabetic numeric system of classification and identification is advantageous. Each machine, piece of equipment, or other asset should be marked or tagged when installed so that any particular piece of equipment can be identified at any time. The tag should carry date of installation and the name of the maker or vendor, as well as its own identification number. By the use of a combined alphabetical and decimal numerical system, almost any possible grouping can be made according to main and auxiliary groups, processes, or products.

Form of Plant Ledger

The form of the plant register or ledger need not be elaborate. Its main subdivisions should correspond with the subdivisions of plant and equipment carried on the general ledger. Thus, if we find therein accounts with buildings (factory, store, office, etc.), machinery, furniture and fixtures for factory, store, and office, delivery equipment, etc., subsidiary records should show corresponding subdivisions. It should be a matter of fixed policy to require a periodic proof of these subsidiary records against their respective controlling accounts on the general ledger. Only thus can the inclusion of all items in both records be made certain. The control established must cover both the items of the assets record—the original cost as shown by the asset account—and the accumulated depreciation as shown by the reserve account.

Asset Record

Aside from the title and classification and identification number, the plant register should provide a record of the asset under the heads of:

1. Date of installation or adjustment. 2. Estimate of life in periods, working hours, service output, etc. 3. Original value, including installation costs. 4. Periodic depreciation burden. 5. Periodic appraisal value.

On the form shown below, provision is made for adjustment of the original estimate of depreciation. Where there is a realizable scrap value, additional columns to show scrap value and total depreciation to be written off should be provided. The form shown would have to be adapted to the method of depreciation decided upon as applicable to a particular asset. Thus, if working hours or service output are the basis, provision should be made to show the basis of calculation of each period’s depreciation burden. The

following form is well adapted to make record of the asset under the straight line method of depreciation.

Plant Ledger (showing adjustment of value)]

Periodic Revision of Rates

In Chapter VIII where the problems in connection with depreciation rates were discussed, a periodic testing of the effects of the particular rate employed was laid down as an essential for the application of any rate. The determination of the rate in the first place is a problem requiring expert knowledge and the most careful consideration of many factors. Hardly less important, however, for the successful operation of any depreciation scheme is the attention given to the manner of its operation and a modification and readjustment of rates to bring the theoretical expectation of the wasting of the asset into accord with its actual wasting to date.

At the beginning, when the asset is first installed the depreciation rate must be based, so far as this particular asset is concerned, entirely on contingencies. None of its life has been lived; none of its actions and behavior have yet become a matter of record. What it is apt to do can be forecast only by a study of its ancestors—heredity as modified by a reasonable expectation of change due to different environment. However, at the end of five years, say, there is available a record of service and behavior in the light of which not only can the accuracy of the forecast be judged, but also a more reliable forecast for the remainder of its service life can be made.

Frequency of Revision of Rates

Because of the conditions stated above, a periodic testing of rates should be made. How frequently this should be done depends largely on local conditions. Certainly sufficient time should be allowed to pass to secure a really worthwhile test. What constitutes a sufficient time depends largely on the expected length of life. Long-lived assets obviously need not be tested so frequently as short-lived assets; and the periods should be shortened when the asset has been serving under supernormal conditions; the intensity of its life would be a controlling factor. It is usually stated that this testing of rates and conditions should be made at least every five years in the form of an appraisal. In the physical appraisal care should be used not to allow present market prices to enter into it, else the element of fluctuation may easily be brought in to nullify or exaggerate the real results of depreciation.

Test of Condition Per Cent

At the time of reappraisal the estimated condition per cent or the expectancy as to remaining service life are the points most to be considered. C. E. Grunsky has made an interesting contribution to the study of expectancy—theoretical, it is true, in the sense that it is based on assumed hypotheses, but nevertheless of value as calling attention to a phase of the subject that presents large possibilities. He takes 10,000 similar articles, all of probable life-terms of 10 years, and all simultaneously installed. Assuming that of these 10,000, 100 will fail or go out of service at the end of the first year, 200 at the end of the second year, that the largest numbers will fail in the years just before and just after the expected life-term of 10 years, and from then on, that there will be a gradual decrease in the number of failures until the 20th year, beyond which time (double the estimated life-period) none will remain in service—the following table is shown, which gives in the last column at the right the life expectancy of all remaining articles as at the beginning of a given year.

It will thus be seen that an article which has survived its 5th year, has at the beginning of its 6th an expectancy, not of 5 years but of 6.12 years; an article which has lived its allotted 10 years has an expectancy of 3.67 years; and so on. Certainly Mr. Grunsky’s study, if it serves no other purpose, at least draws attention to possible lines of development and, read in connection with facts as to the known length of life of many assets which have outlived their expected terms, it draws strong attention to the need of very careful use of any so-called mortality tables. These life history tables for assets are similar to the mortality tables used by life insurance companies.

TABLE OF EXPECTANCY[37]

The probable life of each article is 10 years or periods. For terms other than 10 years, each year in the table may be regarded as a period equal to one-tenth of the probable life-term.

(Based on the special hypothesis of failures as explained in the text)

========+===+========== | FOR 10,000 ARTICLES | SINGLE ARTICLE +----------+------------------+------------+---------- Year or | | Remaining Number | Remaining | Period | Number | of Articles at | Service at | Expectancy at | of | Beginning of | Beginning | Beginning of | Failures | Year | of Year | Year or Period --------+----------+------------------+------------+---------- 1 | 100 | 10,000 | 100,000 | 10.00 2 | 200 | 9,900 | 90,000 | 9.00 3 | 300 | 9,700 | 80,100 | 8.27 4 | 400 | 9,400 | 70,400 | 7.46 5 | 500 | 9,000 | 61,000 | 6.77 6 | 600 | 8,500 | 52,000 | 6.12 7 | 700 | 7,900 | 43,500 | 5.51 8 | 800 | 7,200 | 35,600 | 4.95 9 | 900 | 6,400 | 28,400 | 4.44 10 | 1,000 | 5,500 | 22,000 | 4.00 11 | 900 | 4,500 | 16,500 | 3.67 12 | 800 | 3,600 | 12,000 | 3.33 13 | 700 | 2,800 | 8,400 | 3.00 14 | 600 | 2,100 | 5,600 | 2.67 15 | 500 | 1,500 | 3,500 | 2.33 16 | 400 | 1,000 | 2,000 | 2.00 17 | 300 | 600 | 1,000 | 1.67 18 | 200 | 300 | 400 | 1.33 19 | 100 | 100 | 100 | 1.00 20 | 0 | 0 | 0 | 0 --------+----------+------------------+------------+----------

[37] From “Valuation, Depreciation and the Rate-Base,” by C. E. Grunsky.

Composite and Group Rates

In the practical application of the depreciation rate in a large plant, every separate piece of property is not, of course, considered by itself. The plant is divided into groups of similar assets, determined roughly on the basis of life expectancy, conditions of service, etc. Using these groups it is possible to find the rate of composite depreciation—a figure which serves as a check over the group depreciation. This is also sometimes called the “mean life” of the plant. It is determined by two methods—one called the direct, the other the dollar-year method. Assuming groups of assets of varying life lengths and costs, the following examples show the manner of estimating the amount of depreciation for the whole plant and also composite life; that is, the mean average life of the individual assets when viewed not as units but as a composite whole:

MEAN LIFE DIRECT METHOD

======+=========+================+==============+============= Group | Life | Value | Rate | Amount of | in | to be | of | Periodic | Periods | Depreciated[38]| Depreciation | Depreciation ------+---------+----------------+--------------+------------- A | 5 | $100,000 | 20 | $20,000 B | 10 | 75,000 | 10 | 7,500 C | 15 | 60,000 | 6■ | 4,000 D | 20 | 120,000 | 5 | 6,000 | | -------- | | -------- | | $355,000 | | $37,500 ------+---------+----------------+--------------+-------------

[38] That is, cost less salvage.

Mean life is $355,000 ÷ $37,500, or 9■/■■ periods.

Under the dollar-year method, the invested values are weighted by the length of their investment term and thus all investments are reduced to the common basis of one dollar for one year:

MEAN LIFE DOLLAR-YEAR (OR WEIGHTED RATIO) METHOD

=====+====+===========+=============+================+============ | | Values |Turnover Rate|Total Investment| Group|Life| to be | in Longest | During Longest |Dollar-Years | |Depreciated| Life-Period | Life-Period | (a) |(b) | (c) | (d)[39] | (e) | (f)[40] -----+----+-----------+-------------+----------------+------------ A | 5 | $100,000 | 4 | $400,000 | $2,000,000 B | 10 | 75,000 | 2 | 150,000 | 1,500,000 C | 15 | 60,000 | 1■ | 80,000 | 1,200,000 D | 20 | 120,000 | 1 | 120,000 | 2,400,000 | | -------- | | -------- | ---------- | | $355,000 | | $750,000 | $7,100,000 -----+----+-----------+-------------+----------------+-------------

[39] That is, the number of times renewal of the asset will be required during the longest life-period of any of the assets.

[40] Dollar-years, column (f), is the product of the total invested values as shown in column (e), and the life of each group as shown by column (b). Thus, $400,000 invested for 5 years is the equivalent of $2,000,000 invested for 1 year.

Column (f) ÷ column (e), (7,100,000 ÷ 750,000 = 9■/■■) gives the mean life.

Column (e) ÷ the longest life-period, 20 years, (750,000 ÷ 20 = 37,500) gives an annual charge for the whole plant.

What is known as “mean” age or plant expectancy as to remaining life may be found similarly. Assume a physical appraisal made after 12 years’ life of the above assets:

MEAN AGE (LIFE EXPECTANCY) DIRECT METHOD
=====+====+==============+=========+============+=============== | | Unexpired or |Condition|Values to be|

Values Already Group|Life|Remainder Life| % |Depreciated | Depreciated (a) |(b) | (c) | (d)[41] | (e) | (f)
-----+----+--------------+---------+------------+--------------- A | 5 | 3 | 60 | $100,000 | $40,000 B | 10 | 8 | 80 | 75,000 | 15,000 C | 15 | 3 | 20 | 60,000 | 48,000 D | 20 | 8 | 40 | 120,000 | 72,000 | | | | -------- | -------- | | | | $355,000 | $175,000
-----+----+--------------+---------+------------+---------------

[41] (d) = (c) ÷ (b).

Group A assets, having been twice renewed, would be in 60% condition; Group B, 80%; Group C, 20%; and Group D, 40%.

Column (f) ÷ column (e), (175,000 ÷ 355,000 = 49²¹/■■%) gives the per cent of composite depreciation already taken effect.

The mean life, as determined above, multiplied by per cent of composite depreciation gives the mean age or portion of the mean life already lived (9■/■■ × 49²¹/■■% = 4■).

The figure of mean or composite life may serve two purposes. First, it forms the basis for comparison with other similar plants and is about the only fair basis for comparison. Second, it gives the basis for estimating the amount of annual depreciation of the plant as a whole. This statement does not mean that individual depreciation reserves are not to be carried for each group of assets and those charged with the value of the asset as soon as it is discarded and renewed. But the use of the estimated mean or composite life figure does give a control over the amounts which should always be found in the individual group reserve accounts, i.e., at any given time the sum of the individual reserve account balances should be approximately equal to the amount as shown by the reserve when calculated on the mean life basis.

The Reserve as an Index of Financial Condition

The statement is often made that a balance sheet showing depreciation reserves points to a conservative policy in the treatment of plant properties. Usually such a balance sheet affords little or no basis for expressing a judgment as to conservatism or the lack of it. All that it does show is that recognition is made of the _fact_ of depreciation. As to its _adequacy_ or _inadequacy_, a knowledge of other factors is necessary.

Fluctuating Reserve. According to successive balance sheets a reserve may vary little from year to year, or it may show considerable increase or decrease, and any of these conditions may be entirely normal and express adequacy of reserve requirements. In the first case, stability of the reserve may result because the asset is short-lived and hence is more or less frequently replaced; or different units of the property may have been installed at somewhat regular intervals so that retirements from service are also somewhat regular. Under either supposition, the charges against the reserve for the units displaced would just about keep pace with the regular credits to reserve for replacement purposes. In other words, that condition of the reserve for that class of asset is the normal condition—except perhaps in the case of a rapidly expanding plant, or other conditions not counted as normal when the reserve requirements were put into operation—and any other condition should lead to inquiry and investigation.

Increasing Reserve. In the second case where the reserve is showing a considerable increase from year to year, that also may be a normal condition. Long-lived assets are seldom replaced with any degree of regularity in the annual charge against the reserve, except in the case of very large plants where the number of such assets is correspondingly large in proportion to their size. Here more or less regular installations may take place as a result of an expanding business, covering a period of approximately the same length as that of the life of the asset. So here, too, any other than a regularly increasing reserve must incite inquiry.

Decreasing Reserve. As to the third case, that of a somewhat regularly decreasing reserve, the condition is not usually normal but may occasionally be met in a plant where one type of equipment is being retired and not replaced, due perhaps to a changing line of activity; as when, for instance, a stock furniture manufacturer works gradually into the exclusive manufacture of automobile and carriage bodies. Some types of equipment will thus be gradually retired and their reserves will constantly diminish, their place being taken by other reserves covering the new type of equipment. However, this condition of decreasing reserves, while entirely normal under certain circumstances, being unusual, should always receive careful investigation. It is here that mean life and mean age or composite plant depreciation are of assistance in forming a judgment as to the general adequacy of reserves.

The Reserve in Relation to Expanding Plant

In the case of a plant the development of which is stationary, the problem of judging the adequacy of the reserves is simple in comparison with a plant which is expanding, resulting not only in the installation of more of the same kind of equipment but also of

equipment of other kinds. A disturbing element is thus introduced and careful oversight of the depreciation policy must be exercised. In all cases, intelligent reading of the reserve and its sufficiency are internal problems based on intimate knowledge of conditions. Lacking this knowledge no true judgment can be made. The character of the asset, number of units in use, dates of installation, a comparison of the assumed conditions at date of installation with the actual conditions of the present—all are factors to be taken into account.

Reserve as Related to Efficiency

The general relation of efficiency to depreciation has already been discussed. As to whether the condition of the reserve is any index of the efficiency of the service rendered by the plant unit, attention is briefly directed to a misinterpretation of individual reserves. Experts state that many types of equipment cannot deteriorate actually more than a fixed per cent of their cost and continue to give efficient service. If, say, 30% is the limit in the case of one type, this does not, of course, indicate that, as soon as the depreciation reserve shows an amount equal to 30% of the cost, the approach of inefficient operation and the time of discard are at hand. It must be borne in mind that the reserve is a device based on financial considerations and, if properly calculated and handled, no asset should be ready for retirement until its reserve approaches in amount the value at which the asset is carried in its account. Nor is the point of approaching inefficiency shown until that condition of the reserve is found.

Reserve not Based on Cost of Replacement

The question is sometimes raised as to whether reserve requirements should be based on original cost or cost of replacement new. The question usually reveals a lack of understanding both of the purpose of the depreciation charge and the means of financing depreciation. It is usually said that the reserves carried on the books are for the purpose of providing the means of financing the replacement. It is not the purpose here to go into the question of original cost versus cost of reproduction new, either as a basis for valuation of public utility properties or from the viewpoint as to where the incidence of the burden of replacement properly should rest—whether on the users of the service given by the asset to be replaced or on those using the new asset. In the private enterprise where the rights of the public are not so apparent, under present-day tenets of political and economic philosophy, only internal policies and purposes to be accomplished need be considered.

As stated above, the basic purpose of the creation of the reserve is to burden the product with depreciation charge as a real part of the cost of production. If we are concerned with real and actual costs of production, by no stretch of the imagination can replacement cost—what it might cost to replace the asset at some more or less distant time—enter into the question. It might, with equal obscurity of logic, be said that, because the labor cost is bound to be higher 10 years from now than at present, in order to get the true _present_ cost of the product the estimated future labor cost should be taken in place of the actual present cost.

The Financing of Replacements

If one purpose of the depreciation reserve is that of financing depreciation, this can mean only that the reserve must insure provision being made so that the capital invested will not be lessened or encroached upon by the wasting of the assets in which it is invested. It is no necessary or proper purpose of the reserve to provide for increasing the invested capital. _Financing_ the _replacement_ of the retired asset is a separate financial problem and only concerns accountancy, so far as the records may reflect that policy. The reserve, in itself, does not furnish the means of financing any part of replacement, as was fully shown above. If the new asset is expected to cost more than the old, certainly business prudence would dictate provision for the added cost as well as ready funds of an amount equal to the original cost. The actual capital provided originally need be sufficient only for the time being; to provide more than that, if remaining idle, would be folly. If there is evidence of expansion, or if it is recognized that more will be needed—due to change in markets—for replacement purposes than was originally needed at the inception of the enterprise, provision must be made therefor.

Methods of Financing Replacements. In the financing of replacements, three courses are open:

1. Capital stock may be increased. 2. Funds may be borrowed. 3. Profits of the past may be reserved in the business and the actual value of the holdings of the owners thus be enhanced.

In the third case present dividends may be sacrificed for the sake of the future. Such reserve profits must be kept and used for the intended purpose, the purpose dictating their form as liquid or fixed. It cannot be too strongly emphasized that these are reserves of _profits_—not valuation or offset accounts under the title of reserves. Depreciation reserves, except they become secret reserves

in the sense referred to below, have no right to serve any other purpose than that intended, viz., to provide insurance that none of the originally invested capital shall be dissipated and that the current product shall be burdened with its just share of _all_ the materials and costs of production.

Secret Reserve

A great deal has been said about inaccuracies in the depreciation charge; the need of periodic readjustments has been emphasized. Now it is purposed to look into the effects of inaccurate charges remaining unadjusted on the books. In a desire to be on the safe side, some concerns, notably financial institutions, make very liberal provision for depreciation. Such a policy is not entirely to be condemned and is decidedly refreshing in comparison with the parsimonious allowances, begrudgingly made in some quarters. The effect of such a policy, if operated without check, is to create what is known as a “secret reserve.” The value of the asset is charged more rapidly against operation than the asset actually wastes. Hence the books show a reserve sufficient to cover the cost of asset while there are still values remaining in the asset. In other words, the business possesses an asset of value which is carried on the books as of no value. Were the real present value of the asset brought on the books, the contra credit would appear in some surplus or _profits_ reserved account. Such would constitute a true record of the item, openly stated. So long as the asset remains concealed, i.e., without record on the books, its contra credit is also latent and constitutes a _secret_ reserve of profits.

A too liberal depreciation policy, if recognized and adjusted at the time of a reappraisal, will require a separation from the depreciation reserve of the portion brought about by the overallowance, and its showing as a part of the surplus. When so handled, an overcharge for depreciation has no permanently bad effect except as it may show, for purposes of comparison, too high costs of production for the period overburdened. However it may be and sometimes is, used for purposes of fraud and therefore, as a fixed policy, the practice of the secret reserve is to be condemned.

Insufficient Charge

On the other side is the parsimonious policy of too low a charge or none at all. This results, whether consciously or not, in a charge against capital instead of revenue. At the close of the fiscal period the books are supposed to be brought into accord with the facts of true condition as then existing. Therefore, if the full portion of the accrued expenses is not separated from the wasting asset accounts, but is allowed to stand on the books under the title of assets, then these true expense items will still be carried hidden under the cloak of asset titles. The depreciation is thus carried as a charge against capital. The depreciation of a _going_ concern should never be so treated; it is an operating charge, and no flight of fancy or shuffling of figures can make anything else of it.

In the case of a property, showing inflated values because of too low depreciation charges in the past, which is taken over and rehabilitated, the sums spent on the property previous to operation to put it in condition are properly capital charges. This is allowed on the theory—unfortunately, not always a fact—that the difference between the book value of the property and what was paid for it represents the estimated expenditures necessary to bring the property up to its book value. If such is not the case and full book value was given for the property, the charge is still allowed, being looked upon as in the nature of an organization expense, representing in an instance of this sort the measure of the bad bargain made. This will, of course, result in a penalty in the form of an added depreciation burden on all product from the property taken over and rehabilitated.

Appreciation as an Offset to Depreciation

If depreciation is so inevitable and the necessity of its charge so absolute, can anything be said in support of the proposal to offset depreciation against appreciation? By appreciation is meant an increase in value due to the passing of time. Judicial authority can be found in support of it in cases of valuation for rate purposes.[42] There is no question but that a _realized_ increment in land or any other asset offsets a depreciation or any other expense charge in just the same way that any other item of income offsets an expense. There is, however, this marked difference between depreciation and appreciation: the former is an inexorable reality advancing day by day entirely independent of market fluctuations, whereas the latter is dependent on the market and usually cannot be realized until the asset is sold.

[42] See Consolidated Gas Co. v. City of New York, 157 Fed. Rep. 855, and 20 I. C. C. Rep. 344.

When, however, as is too often the case, the proposal to offset depreciation by appreciation is meant to justify a policy which takes no cognizance of depreciation on the books because it is offset by appreciation, no support can be found for that view. In itself it

reveals an entire lack of knowledge of the purpose of the depreciation charge or a disregard of the fundamental and obvious requirements of prudence. Depreciation is one of the costs of production and without it true cost cannot be shown. Failure to show depreciation on the books would justify also the omission of a cash income item because the cash was to be spent immediately in payment of salaries—a cancellation outside the business records of income against expense which can under no circumstances be justified.

Appreciation Due to Physical Changes

There is a kind of appreciation which is not dependent on fluctuations of the market and which as surely accrues, up to a certain point, day by day as does depreciation. Properties the value of which has been enhanced by earth construction work done on them are susceptible of this kind of appreciation. “Appreciation is generally restricted to physical items, and measures their gain in value due to age, use, and properly directed labor.... It results from work not specifically charged to capital account ... and covers items not represented ... in connection with a valuation.”[43] It is found in connection with such items as roadbeds, solidification and grassing of slopes, drainage, dams, embankments, etc.

[43] Valuation Committee of the American Society of Civil Engineers.

Its two forms are called solidification and seasoning, and adaptation. By the first is meant a settling and compacting of loose earth and its protection from wasting and washing away, as by the grassing of slopes, and the planting of trees and shrubs to hold the snows. When a roadbed is turned over to the operating division, it frequently is far from complete in the sense of being in a high state of efficiency, and the cost of its maintenance and up-keep during the early years of its life is much higher than during later years. This appreciation due to seasoning is difficult of valuation, but perhaps the difference in up-keep between early and later years is the best measure of it.

Appreciation Due to Adaptation to Use

“Adaptation” is a term used to cover that class of expenditures needed for the better adaptation of the property to its use. In the early stages of the development of a property many things cannot be foreseen nor can a proper basis be settled upon for a determination of the charges as between capital and revenue. The proper handling of such expenditures as those incurred for drainage requirements, better adaptation of the roadway to the surrounding topography of the country, etc., are difficult. If these costs have not originally been charged against capital, the properties may truly be said to have appreciated in value by reason of them. Items of this kind require a wise discrimination between costs of operation and capital charges. The effect of such changes is almost always lost sight of so far as physical appearance shows, and the appreciation due to them is difficult of valuation at a later time. In the case of railroads, perhaps the difference in maintenance cost as between the early and later years of the roadbed is the best index.

In the case of industrial concerns, the cost of a rearrangement of machinery and working facilities for the better and more economical handling of the product frequently results in an appreciation in value due to adaptation to use. This has already been discussed in Chapter V.

As stated above, appreciation has judicial sanction and its valuation, although fraught with many difficulties and uncertainties, has been made and the results accepted. The generally haphazard method of roughly estimating the value of an appreciation when its determination becomes necessary suggests that it were better, by far, to attempt the proper segregation of the charge between capital and revenue at the time of its incurrence, rather than to take cognizance of an appreciation in value at a later time. There are undoubtedly circumstances in which appreciation in value can be properly recognized and should be taken into the accounts not only of public utility properties but also of industrial concerns.

Unearned Increment

Appreciation in value due to so-called unearned increment is entirely a matter of market value. By this is not meant that the monetary value of this kind of appreciation fluctuates with the market; it accrues from day to day and is just as real as depreciation. Although very real, it does not become _realized_ until the property is disposed of, a thing which is determined by business policy and does not rest on any principles of accountancy. It is not good practice to bring such unrealized values on the books. For a fuller consideration of this phase of the subject, see Chapter XVII where the problem is treated in connection with land and real estate.

Depreciation Policy and Stockholders

A final consideration concerns the relation of the depreciation policy to the stockholder. As stated above, a too liberal depreciation policy results in the creation of secret reserves which may be used to the prejudice of the stockholder by an unscrupulous managing clique desirous of buying minority holdings at a depreciated value or of manipulating the stock for speculative purposes. An insufficient depreciation allowance results in a false optimism, a payment of dividends out of capital, and perhaps finally in a wrecking of the property. Except for the transient, speculative shareholder, a fixed depreciation policy based on a conservatively accurate allowance is always for the best interest of the property and its owners.

CHAPTER XII

CASH AND MERCANTILE CREDITS

Introduction

In Chapter V an effort was made to establish the general principles of valuation as applicable to the main classes of assets found on the average balance sheet. In doing so, the fundamental distinctions between capital and revenue charges were set forth. In the six chapters on depreciation the general principles of depreciation and their application to problems in accounting have been developed, with particular emphasis on the problems of valuation and true costs. It is purposed now to consider in detail the various problems met in the valuation of the individual items found on the commercial balance sheet. It will be necessary also to consider the method of showing these items so as to indicate the basis of valuation and something of the financial policy employed. The various assets will be considered in the order of their appearance on the balance sheet, the arrangement being based on degree of liquidity, beginning with the most liquid.

What Cash Includes

There is little to be said about the _valuation_ of an asset of such evident and definite value as cash. The problem here is rather one of showing the nature of the asset, although certain principles of valuation under given conditions need also to be considered.

The term cash as an item in the balance sheet usually includes all money and whatever serves as money. Thus, all legal tender of the realm, bank notes, checks, bankers' drafts, postal and express money orders, and occasionally postage stamps and even "IOU's" are classed as cash. Not all items, however, that may be carried on the books as cash should appear under this caption on the balance sheet. There only the current asset cash should be listed in the group of current assets. All other cash, including that held for specific purposes under deed of trust or otherwise, should, unless it is readily applicable for the cancellation of current liabilities, be shown in some other group.

Where the petty cash or working funds of all sorts are operated on the imprest system, the funds should be replenished before the books are closed and should thus be truly valued at their ledger figures. The bank account should be reconciled with the cash book, and the figure should represent the amount at which the item is to be taken into the balance sheet. This means, of course, that all properly authorized claims against cash in bank are to be treated as cash disbursed if they have been regularly issued, whether presented for redemption at the bank or not. Checks written but not yet mailed are not usually treated as cash disbursed because they are still under control. Similarly, items left at the bank for collection and deposit may be counted as cash on hand. If, however, as might happen in exceptional cases, a comparatively large amount represented dishonored items and a second attempt was being made to collect these dishonored items, the better procedure would be to omit them from the cash total and include them with the receivable items. In this connection attention should be called to the practice occasionally met with of holding the cash open for a few days after the closing date for the purpose of making a better showing as to balance on hand by means of new collections. This, of course, is a practice which cannot be countenanced under any circumstances as it is simply an effort to mislead, even though the effect may not always be bad. A balance sheet is a statement of financial condition purporting to be true as on a certain named date. The values shown therein are therefore to be those applicable to, and true on, that date and no other.

Stamps Remitted as Cash

Some concerns dealing in commodities of small value sold through the mails allow, and even encourage, payment by means of postage stamps, these in turn being used for their own correspondence and parcels post expense. The proper place to record the value of this item at the close of the fiscal period is in the inventory of office supplies or other similar heading instead of treating it as

a part of the cash. This necessitates a transfer from cash to office supplies. The transfer can be accomplished in either of two ways without interfering with the usual handling of the cash whereby it is checked against the bank's record of deposits and checks as explained in Volume I, Chapter XXXV. The customary method is to use the cash book as the place of record for the receipt of stamps and then transfer them to the stamp drawer for office use. All other "cash" being deposited in the bank, the record of cash receipts as shown by the cash book does not thus check against the record of deposits as shown by the bank. To secure this agreement, a check may be made out payable to "Cash," "Ourselves," or "Postage," and passed through the bank periodically as a deposit and so secure the proper agreement between the bank's record and the concern's. The record of the check among the cash disbursements thus secures the proper charge to Postage or Office Supplies and also effects the proper agreement between the bank's record and the concern's. The use of a "postage" journal, operated on the same lines as the cash book and recording all receipts and disbursements of postage, would accomplish the same purpose and in some circumstances would be advisable.

Temporary Cash Disbursements

The practice of allowing proprietor, cashier, or others to take cash from the cash drawer and leave a memo of some sort to show responsibility or purpose is to be deprecated. Only where the principle is strictly adhered to of depositing all cash and disbursing only by check and by means of a petty cash fund handled under the imprest method, can adequate control over cash even be approximated. Where, however, such is not the practice, the problem is not that of the valuation of cash, for the memos are not cash, but of the valuation of claims receivable—a subject to be treated later in this chapter.

Disposition of Cash Funds

In the showing of cash for purposes of management, it is essential to indicate the present disposition made of the various cash funds or to show the immediacy of the control over them. Thus cash should be listed as:

1. Safe or drawer 2. Various working funds 3. Petty cash fund 4. Bank

Under "Bank" should be indicated how much is held on "current" account and how much is restricted to special purposes. Of the current balance it is desirable to show the portion subject to check for immediate needs and the portion representing surplus funds not immediately needed and therefore held to earn interest. These amounts subject to interest are almost always available on short notice, but usually only with the sacrifice of interest earnings to date.

Cash from the sale of capital stock or bond issues, or from the sale of old plant or any portion of it, under authorization from the stockholders that it be held for purchase or construction of new plant, or for other capital purposes, comprises that held for specific purposes. Sometimes even cash in the sinking funds might be included in the list. As it is usually of importance to keep the management informed as to the amounts of cash available for the various purposes stated above, an effort should be made to give this information, without too much detail, in the balance sheet if it is drawn up for internal use.

Cash Held Abroad

There remains to consider moneys held in a foreign branch and thus subject to fluctuations of exchange. In Chapter XXXI, where the subject of the foreign branch is treated, a full discussion of the problem of exchange in its relation to the accounting records will be given. Here it is sufficient to say that as between countries where exchange rates vary little, the general practice is to use an arbitrary conversion figure for incorporating the results of the foreign branch with those of the head office. This conversion figure applies to cash as well as to all other items. The use of such an arbitrary basis will give substantially correct results under the conditions named.

The assets of the foreign branch are the properties, usually and for the most part, of proprietors and stockholders residing in the country of the home office, who are concerned merely with the distribution of the earnings of the foreign branch. Profits are made in one currency to be distributed as dividends in another currency. Hence, the rate of exchange prevailing at the time of closing the books would usually give the most accurate results and should, of course, be used when exchange is not fairly stable between the two countries. It may even be conservative and advisable to set up a reserve for fluctuations in exchange, with the object of absorbing what might otherwise be too great a charge or credit to the current period's profit and loss if a particularly unfavorable or favorable rate were prevailing on the date of conversion.

Accounts and Notes Receivable

In the valuation of accounts and notes receivable the problem is largely one of appraising the uncollectible items. The book account and note are intermediate stages in the conversion of merchandise into cash. Were they always worth their face value there would usually be no problem in their valuation except for the element of theoretical interest which is not commonly taken into account by commercial enterprises. In considering this problem of valuation, the question of the correct use of terms arises. For the sake of clearness, when showing the items on the balance sheet, attention will be first directed to this latter phase of the subject.

Objection to the Title, Accounts Receivable

The governing principle here is that only current items can be included in this group of assets when shown on the balance sheet. In accounting, as in economics, there is no distinctive scientific terminology. The economist makes use, for the most part, of every-day words and phrases. These are often open to misunderstanding and are sometimes capable of being used even for wilful misrepresentation. Recognition of this fact has made necessary a more careful definition of some terms. In the language of the street, almost any claim against outsiders may be spoken of as an “account receivable.” The term is thus so broad as not only to include current claims against customers in regular course of trade, and accrued income, such as rents, commissions, interest, dividends, etc., earned but not yet received, but also to serve as a cloak covering many other kinds of claims and deposits. Among these may be enumerated:

1. Cash deposited to cover breakage or damage to equipment in use, to guarantee the payment of prospective expense, or to guarantee good faith in the performance of a contract. 2. Moneys advanced to subsidiaries, salesmen, and other employees on account of expenses and salaries. 3. Claims against creditors for returned or damaged goods, against railroads for lost or damaged goods, and against governments for rebates, drawbacks, and the like. 4. Prepayments on purchase or expense contracts, as payments made to bind a bargain or before delivery of goods; and expenses paid in advance, such as royalties, rents, interest, etc. 5. Unpaid calls or instalments on stock subscription contracts. 6. Claims against absconding officers for property appropriated or trusts violated.

It is necessary, therefore, to employ a term of more definite meaning which cannot be misused. The word “Customer” is sometimes used and is not objectionable. However, the term “Trade Debtors” is more generally employed and will be so used here as denoting all claims against customers, clients, etc., in regular course of business. Its appearance in a balance sheet is usually evidence of a careful discrimination among the various classes of claims and is not therefore a misleading term.

Risk from Credit Losses

As stated above, the chief problem in valuing accounts and notes receivable is that of estimating bad debts. It is a matter of general experience that some of those to whom credit is extended do not pay their bills. Hence, at the close of the fiscal period it is necessary, so as not to overstate the asset, to estimate the amount which probably cannot be collected. The necessity for this is recognized in a decision of the United States Supreme Court in Providence Rubber Co. v. Goodyear, 9 Wall. 788, and has the sanction of conservative business policy.

The effect of such an estimate is that the period in which the sale is effected is made to stand the loss, and not the one in which failure to secure collection is experienced. There is a close relationship between the actual loss from bad debts and the credit policy of a concern. Where the sales force is allowed to grant credit, the loss from bad debts is almost invariably large. Where the extension of credit is controlled by a credit department, the loss is less than in the other case but depends on thoroughness of information and investigation of the risk. However much care may be exercised, there will be nevertheless some loss, but a live credit supervision should keep the loss at a minimum.

Risk and Length of Credit Period

The amount of loss, or rather the percentage of loss, is not the same for different lines of business nor even for different concerns in the same line. The normal credit period for a particular business has some relation to the loss. Thus if credit supervision and collection effort are the same for two concerns, the one with the shorter credit period will usually have the smaller loss. In a business, for example, where the credit term is 60 days, we would expect fewer uncollectible accounts than in one whose credit period extends for a year or more. As between two concerns in the same line of business, _where conditions are fairly uniform_, however, there should be little variation in the loss from bad debts. As pointed out in Volume I, Chapter XXXVI, the sales discount policy is for the most part a device for overcoming the element of risk in the extension of credit.

Analysis of Customers' Accounts as the Basis for Estimate of Bad Debts

In estimating the amount of bad debts, experience within the particular business is the only safe guide. Oftentimes, however, the manager or proprietor is not the most competent person for the task. The auditor, in consultation with the manager, may often arrive at a better estimate than could someone closely connected with the business. In making the estimate, it is an aid to analyze the accounts according to the length of time they are past due. Thus, there would be, after analysis, the amount of those overdue not more than 30 days, the amount of those overdue not more than 60 days, the amount of the 60 to 90 days overdue items, those 90 days to six months, those six months to a year, and all those more than a year overdue. The total amount outstanding minus the sum of these overdue classes represents the portion not yet due. Some part of the not-yet-due portion is, of course, still subject to discount if paid within the discount term. With the claims against customers thus analyzed, a much better basis is afforded for testing the adequacy of the provision for bad debts. The various methods of estimating this provision are discussed on page 219.

It may here be noted that when making up the estimate of bad debts it is by no means always necessary to analyze the outstanding items as suggested above. Such an analysis is of value in three cases:

1. In the case of a new concern where there is no past experience on which to base the estimate. 2. In the case of an outsider—a professional auditor or other party—being called upon to make the estimate. 3. Periodically, in any business, as a check on the work of the collection department.

The value of the analysis in cases (1) and (2) is based on the principle that the longer an item is overdue, the greater is its likelihood of proving uncollectible. The need of an increasing rate for the different classes as analyzed above is apparent. In case (3) its value lies in the fact that it reveals the general effect of the collection policy and incidentally points out any change in policy. Any additional factors which may have wrought a change in the general financial situation must, of course, be taken into account.

Basis of Estimate of Bad Debts

Three methods of making an estimate of bad debts are found, in all of which a percentage of some given base is used. The various bases are respectively:

1. The amount of outstanding trade debt at the time of the balance sheet. 2. The amount of sales on credit made during the present fiscal period. 3. The total sales, both cash and credit, for the present period.

Trade Debtors as the Basis. The use of trade debtors as a base is obvious because it represents the uncollected charges from which alone can any loss from bad debts arise. The use of such a base seems correct in principle. This is so in cases where a balance sheet is made up only once a year, so that conditions as to the periodicity of the sales are practically the same from year to year. The amount of loss from uncollectible items is then somewhat nearly proportional to the amount of claims outstanding at the close of the fiscal year. But where it is necessary to make the estimate monthly, or oftener than once a year, it is very probable that at some of the intermediate periods the amount of outstanding claims will bear no logical relation to the loss from bad debts. Thus, in the garment industry the sales for practically the whole year are made within a few months, and during the other months the processes of manufacture and collection are carried on. For these reasons the amount of bad debts is not proportional to the outstanding claims at the end of each month, nor does such a base properly allocate the losses to the periods in which the sales are made. Accordingly one of the two other methods previously mentioned is used.

Sales as the Basis. Inasmuch as there cannot be any loss from bad debts in the cash sales, theoretically the credit sales provide the proper base for making the estimate. Practically, total sales, either gross or net, furnish the base most frequently employed because the total is always available without the necessity for analysis. So long as the ratio of the two kinds of sales remains fairly constant, the loss from bad debts does bear a direct relation to total sales.

Summary. It may be said with respect to the use of trade debtors as a base, that it gives satisfactory results where conditions are uniform from period to period. In its use, however, cognizance must be taken of any change in the credit policy of the business whereby the term of credit is shortened or lengthened as that in itself would tend to change the ratio of the base to the estimated loss from uncollectible items. As between credit and total sales, theory favors the former but practical considerations the latter. If for any reason the ratio of cash to credit sales should change, the change would have to be taken into consideration when making a comparison between periods of the loss from bad debts. No justification can be found for a fourth method sometimes met with, which makes the provision for bad debts bear some relation to the net profits—large if profits are large, and small or none if profits are small.

In handling the estimate of bad debts on the books, the same considerations are to be observed as in booking depreciation. Care must be exercised not to allow the reserve to grow beyond liberally estimated requirements and so create a secret reserve, nor to fall below such requirements. This must be watched closely and, if need be, the rate changed to accomplish the desired result.

Discounts and Collection Costs

In connection with the valuation of trade debtors, the problem of collection costs and cash discounts must be considered. Some authorities connect these costs directly with sales and make provision for them in the valuation of the current trade debtors; i.e., an estimate of the cost of collecting the outstanding claims and of the probable amount of loss from discounts on the amounts outstanding is deducted by means of reserves from trade debtors and so shown on the balance sheet. Where such a practice is followed, strict consistency would require that a similar credit provision be made for discounts on purchases—a practice not often advocated. The weight of opinion is in favor of taking all such costs and credits into account only when they are actually met. This accords with the treatment of these items as financial management items (explained in Volume I, Chapter XXXVI) and as therefore bearing no direct relation to sales. If, however, unusual costs of this or any other kind are anticipated, prudence demands that provision, by means of reserves, be made for them. Usually the costs average up pretty well from period to period.

Valuation of Other Receivable Items on Open Account

The problem of valuing the other classes of receivable items previously mentioned on page 215, does not differ in the main from that of trade debtors just discussed. If they are worth their face value they should be so shown. If worth less, the necessary valuation reserves should be set up. With these items the _chief_ problem, however, is their proper showing on the balance sheet; i.e., their correct classification and a suitable nomenclature. Most of the items are not strictly current, but even their inclusion under this head is not misleading if they are carefully earmarked to show their true nature. Some of them are decidedly fixed, some are in no sense assets. In some cases even trade debtor balances as carried on the books are not strictly current. In concerns where sales are made on an instalment basis, usually the payments extend over several months and oftentimes years. The customer is charged with the whole amount and credited with the regular instalment payments as made. The portion of the outstanding balance covered by the more remote payments is thus not current. In concerns where both regular and instalment sales take place, a separation of the customers' balances on the basis of the sales contract gives the necessary information for balance sheet purposes. The accounts of instalment trade debtors normally require a much more liberal valuation reserve than those of regular credit customers.

Loss on Notes Receivable

In some cases the expected loss because of uncollectible notes may be less than that from open accounts, due to the greater formality of the note as an instrument of credit and the probably greater loss of credit to the maker in case of dishonor. However, in making provision for bad debts, the practice is almost universal to class the two receivable items together. Such practice is undoubtedly sound. In the case of notes, the request for payment is more forceable because of the definitely stated due date and the loss of standing if unpaid after such date. In some cases the payment of notes is not pressed, nor is any extraordinary provision made for past-due items—as in industries allied with farming when an unusually bad season makes impossible the payment of notes given by farmers. Again, the practice is sometimes made of taking notes for a long overdue, open account. These have usually no better value than the accounts and must be treated accordingly.

The usual method of handling overdue notes receivable is given in Volume I, Chapter XXXVIII. As there stated, where payment is allowed to lapse, it is generally advisable to insist on the giving of new notes in place of the old. There may be circumstances in which this is not advisable, but the proper method will usually be apparent in each case.

Interest on Notes Receivable

The valuation of notes receivable—using the term to include all written promises to pay, i.e., promissory notes, accepted drafts, and the like, requires a consideration of interest. By far the larger number of notes given in trade are non-interest bearing and are not therefore worth their face value until they become due. The interest problem in the valuation of notes is thus whether the notes should be shown at their face value or present, i.e., discounted, value. Notes which are interest bearing from their date of issue are, of course, worth their face, on the assumption that the interest takes care of the discount. Where non-interest bearing notes form a very considerable item it is well to value them on a discounted basis; if their amount is small, theoretical principles of valuation give

place to practical considerations and they may be valued at their face. Where notes bearing interest are valued on a discounted basis, care must be exercised not to include the interest accrued both in their face valuation and also under the head of accrued income.

Balance Sheet Titles for Notes Receivable

The problem of terminology is also met in handling notes receivable. Under the balance sheet caption “Notes Receivable” should usually be included only notes received from trade debtors, and certainly it should never represent any but current asset items. Notes received from officers and employees, of indefinite term and the payment of which will not be pressed, should be recorded under some such title as “Notes Receivable Special.” Long-term notes and those representing loans or advances of any sort should be properly earmarked, as should also loans carried on open account, salary overdrafts, and the like. The latter should be shown under Deferred Charges. These nicer points of valuation cannot be presented on a condensed balance sheet, but care should at all times be taken to make such a showing as will not be misleading and will serve the purpose for which the statement is to be used.

CHAPTER XIII

MERCHANDISE STOCK-IN-TRADE

Definition and Scope of Term

Stock-in-trade, as the term is usually understood, comprises all commodities purchased for resale. Thus, assets, which in one concern belong to the fixed asset group, may be the stock-in-trade of other concerns. In stating the principles of valuation for these assets, it is definitely to be understood that they apply only to such as are used as stock-in-trade, and not to the same items when used as fixed assets. Oftentimes the process of manufacture intervenes between the purchase of a commodity and its sale. In such a case the commodity, at the time of valuation, may be in different stages of completion. It is then usually so listed on the balance sheet under suitable titles, such as Raw Material, Goods in Process, and Finished Goods, all of which are treated as current assets. Included in the problem of valuation of stock-in-trade is the treatment of goods out on consignment, goods of others held for sale on a commission basis, and scrap material. Finally, some points to be observed in taking the physical inventory will be considered.

Valuation at Market or Cost Price

Inasmuch as stock-in-trade is purchased solely for resale or ultimate conversion into cash, it is desirable for the balance sheet to reflect the proper value of what remains on hand unsold. Such goods may have a realizable value higher or lower than cost value, from the standpoint of the market in which they were purchased, and will usually have a higher value in the market where they are to be sold. The value of all current assets to be shown on balance sheet is usually stated at the present realizable value. As applied to stock-in-trade, that must not be understood to mean sale or retail value. To value the stock-in-trade on such a basis would result in taking into the current period the profits on sales not effected until the next period; furthermore, these profits would not even be offset by the costs of making the sale. It may be laid down as a principle of business practice based on sound reason, that the period in which the sale is made should be given credit for it. Stock-in-trade must therefore be valued on the basis of its purchase or wholesale market price and according to well-established practice, either at cost or market, whichever is the lower. This principle has the support of conservative practice throughout the world.

Objections to Valuation at Less than Cost

The effect of valuing the stock-in-trade at a lower market than cost is to bring into the period’s results a loss which may never be realized, either because the change in the purchase market may not be reflected in the sale market, or because, if so reflected, the market may swing back before actual sale of the stock is made. If valuation is to be at the market when that is lower than cost, consistency would seem to demand that, when the market is higher than cost at the time of preparing the balance sheet, market value should be used and the profit occasioned thereby be credited to the current period. The answer to this argument is that operation would thus be placed on a speculative basis.

Again, it is sometimes argued that good buying is just as essential to profit-making as good selling. Accordingly, the purchasing department, with the foresight to buy in a favorable market, should receive the credit for it; if conditions are reversed, it should bear the blame, i.e., the loss. In other words, the period in which the purchase effort is expended should be credited or charged with the

gain or the loss brought about by a favorable or unfavorable condition of the current market as compared with its condition at the time the purchase was made.

Anticipation of Profits or Losses Undesirable

In answer to these various contentions, it may be stated that though good buying is an essential factor in profit-making, no refinement of logic can obscure the obvious fact that goods are bought to be sold and that no profit arises until the sale takes place. All effort before the sale, whether directed towards good buying, careful storing and display, the placing of advertising, or the selection of a sales force, will come to naught unless sales are made. It would seem, therefore, that potential profit or loss on any or all effort preliminary to the actual sale has no place in the current record. From the standpoint of the profit and loss statement, this conclusion as to the policy of valuation of stock-in-trade at cost can be stated without fear of contradiction. In support of this is a direction of the Treasury Department in connection with the federal income tax returns. This reads, as revised in October, 1916: “In case the annual gain or loss is determined by inventory, merchandise must be inventoried at the cost price, as any loss in salable value will ultimately be reflected in the sales during the year when the goods are disposed of.”

From the viewpoint of the balance sheet, objection is sometimes raised—and supported by conservative practice and legal requirement as indicated above—that a balance sheet showing stock-in-trade at cost may thus very obviously under-or over-value the item, a situation not at all desirable. In this discussion, the whole problem of valuation is being treated from the point of view always of a going concern and not of one facing dissolution and the forced sale of its properties. Under these circumstances, such a balance sheet must frequently be used as the basis for asking credit, and credit extended on inflated values of current assets is not properly extended.

Method of Treatment and Summary

To meet this situation, particularly in the case of large fluctuations in the market, the true status of affairs is disclosed by appending to the balance sheet a footnote in which is stated the present market value of the inventory. Without this information, oftentimes, when the market is showing steadily rising values, as much harm and financial ruin may result through the extension of insufficient credit, as under other conditions might arise from an ill-advised inflation of credit. Sometimes the present market value is indicated by setting up a reserve out of _profits_, called “Reserve for Market Fluctuations in Merchandise”—or other similar title—when the market is lower than cost. This method retains the inventory on the books at cost value and so does not burden the current profit and loss, although it does lessen the amount of profits available for dividend distribution. Without doubt the policy is good in cases of extreme and somewhat permanent changes in the market.

To sum up, therefore, the valuation formula of cost or market, whichever is the lower, while based on conservatism may unnecessarily and improperly burden the current income account. Valuation at cost, on the other hand, while placing the profit or the loss in the period when realized may cause the balance sheet to present an entirely inadequate and even misleading story as the basis for credit. To remedy this, three courses are open, viz.:

1. Carry the market valuation, whether more or less than cost, in a footnote to the balance sheet. 2. In case market value is less than cost, set up a reserve out of profits equal in amount to the difference. 3. Carry in an inner column in the body of the balance sheet the present market value.

It would seem, therefore, that valuation at cost with the present market value shown on the face of the balance sheet, is the most desirable practice from every viewpoint.

Depreciation of Stock-in-Trade

Quite apart from this discussion of the proper basis for valuation, which concerns itself with marketable merchandise, is the problem of the method of handling deterioration or depreciation of stock-in-trade as distinguished from fluctuations in value. Such deterioration may result from shelf wear, use of goods for display purposes, changes in style and shape, overstocking which causes an accumulation of goods which soon are out of date or of sizes and qualities seldom used, broken lots where such will injure the sale value, and so on. Many devices, such as the “spiff” or the offer of a premium to salesmen, are employed by up-to-date merchants to keep their stocks free from these items of deterioration; but in spite of all that can be done, it usually proves impossible to keep the stock live in every particular. A valuation at cost under these circumstances would be an obvious inflation of values. If the concern had purchased that quality of goods originally with the expectation of resale, valuation at cost,

under the limitations suggested above, would be the correct basis for showing. Since, however, such is not usually the case, the proper basis of valuation is now the market price—the present price at which goods of similar kinds and qualities can be bought.

It may be objected that the effect here also is unduly to burden the current period with unrealized losses, but this is not the case. The deterioration in value is a very real loss which is entirely independent of any fluctuations in the market. If goods are shelf-and window-worn from display usage, the deterioration is just as much an expense incurred for advertising as a display advertisement in a daily paper. The deterioration due to overstocking is a penalty which the current period should bear because of its poor buying effort or its inadequate sales efficiency. Thus, valuation of the inventory of any stock of goods must have regard to the effect of its present condition on its marketability. Any deterioration which renders the stock less salable is an expense to be borne by the present period and not the period in which the sale is made.

Full Costs of Stock-in-Trade

Cost having been established as the basis for valuing a stock of marketable merchandise, there must next be considered the elements of cost and their application to different classes of goods. By cost of goods is meant full cost, i.e., not only invoice price but all additional costs, needed to place them ready for sale. All costs, therefore, up to the point where goods are ready to create income are proper charges against the stock-in-trade. Customary costs of this kind are freight, drayage, insurance during transit and storage, duty, seasoning or aging costs, warehouse charges, and all similar items. The information as to these costs is usually recorded separately, but at a summary period they are loaded on the invoice cost of stock-in-trade.

In connection with this question of the proper composition of cost, attention is called to two other items sometimes requiring consideration. The first deals with the handling of cash discounts. The point at issue is as to whether the invoice figure should be recorded at the price quoted on a cash basis or on a credit basis. This point is discussed at length in Chapter XXXVI of the first volume where the conclusion reached is that the _credit_ policy of each concern must govern the manner of making the record. If the concern has a fixed policy of buying at a cash price, that price should be the price of record; whereas if all financial and other related policies are based on a 30-or 60-day credit term, the credit price for that term should be the price of record. Particularly is this true when viewed from the sales standpoint where the fixing of the selling price is a part of the financial policy. The second point requiring consideration in connection with cost is the item of interest on the money invested in stock. At the close of the fiscal period should the stock sold and that left on hand be burdened with interest on the average amount of capital tied up in it during the period? The student is referred to Chapter XXVI of this book, where a full presentation of the case for and against the inclusion of interest is made.

The Distribution of Costs Over Stock-in-Trade

It should be said that, due to the particular method of handling purchasing, delivery, and storage, it frequently is not practicable to take cognizance of all items which theoretically are constituents of cost. Each concern must establish a policy relative thereto and hold to it. Having done this, it is faced at inventory time with the problem of determining the cost figure applicable to each unit of the stock remaining unsold. Certain of the costs, such as freight and cartage, have probably been incurred by different lots of miscellaneous merchandise, and to distribute the proper charges to each unit comprising the lot is difficult. Usually a certain percentage sufficient to cover that particular item of cost is spread evenly over all units remaining on hand. Occasionally, especially where the stock is homogeneous and only a few varieties are dealt in, an effort is made to prorate these costs on a more accurate basis. In loading on the freight cost, for example, a combined weight and value record might bemused or, where possible, the official freight tariff might govern. Such minute accuracy is not often needed or desirable, the flat percentage rate on value giving in most cases sufficiently correct results.

The Pricing of the Inventory

A rule-of-thumb method of valuation requires that the purchase price as carried on the last invoice of the article shall be used for pricing the inventory. This usually proves a good working rule, but often raises perplexing problems and is subject to abuse and misuse. If several purchases have been made during the period at different prices, should the last price paid govern the valuation of the portion unsold? The argument for so doing is that the portions unsold probably belong to the last lot purchased, good merchandising requiring that the old stock be sold out before the new is brought forward. That, of course, is not always the case. If it is made an inflexible rule that the price of the last lot bought shall be the price of the inventory, a dangerous tool is placed in the hands of the unscrupulous. A manager needing or desiring to make a better showing of profits might in this way make an

insignificant purchase at a high price near the end of the fiscal period and so secure a much higher valuation than the cost for the whole inventory. Where the inventory is likely to contain remnants of the various lots purchased during the period, or where the condition as to an insignificant final purchase may exist, the policy of using an average price for the inventory will be more accurate in its results. The weighted average, whereby each purchase price is weighted with the volume or quantities purchased, is fairer, though more complicated than the straight average. Thus 10 units bought at $100 per unit, 15 at $90, and 3 at $110, would give a straight average of $100 but a weighted average of $95.71, (1,000 + 1,350 + 330) ÷ (10 + 15 + 3). In manufacturing establishments where the fiscal period is short, say one month, and it is desirable to keep the raw material cost as nearly uniform as possible, the method of the weighted average is to be recommended.

As mentioned above, each concern must fix its own policy as to what items shall be included in the cost of goods purchased. Whatever that policy may be, care must be exercised to make sure that the same items and no others form part of the value of the inventory. In the case of any doubtful items, instead of trusting to memory, a house classification of accounts or an accounting guide book should be drawn up so as to secure from period to period a similar handling of all items.

Valuation of Manufacturing Inventory

The whole of the foregoing discussion concerns the valuation of goods bought for resale, i.e., the inventory of a trading business. Some points in the application of the same principles to a manufacturing concern will now be considered.

Finished Goods. So far as finished goods are concerned, the principle of valuation at cost applies. What constitutes the cost of manufacture was discussed in Chapter III, from which it is evident that many other elements in addition to those which must be considered in a trading concern must be taken into account. The manufacturing cost formula comprises the three items of: (1) raw material consumed, (2) direct labor applied, and (3) factory expenses incurred, this latter item sometimes called overhead expenses. When a concern operates a detailed cost system, the valuation of the finished product is not difficult, being the goal towards which the system works. Where no cost system is used, great care must be exercised to make sure that every item of cost is calculated as accurately as possible and that a proportionate share of such costs is applied to the finished product still on hand unsold. It is sometimes urged that instead of this cost-to-manufacture price, the price at which the article could be bought on the open market should govern; or, alternatively, that the article should be valued at least sufficiently above cost to give a theoretical profit to the factory. Just as in the case of the discussion of “cost or market price” for the trading concern, the same conclusion is reached here, viz., that cost should govern, because while good manufacturing is an element in profit-making, yet no profit is made until the sale is effected. It is true that if cost to manufacture is lower than cost to buy in the open market, a real _saving_ has been made by the policy of manufacturing rather than of buying, but a saving is quite another thing from a profit. This differentiation between a saving and a profit will be fully discussed presently. Correct accounting, therefore, requires a valuation of finished goods at cost to manufacture.

Raw Material. The valuation of the inventory or raw material is on the same basis as that of a stock of goods bought for resale, i.e., raw material is to be valued at full cost up to the point of its consumption.

Goods in Process. The valuation of partially completed goods, i.e., “goods in process,” is a much more difficult problem. To simplify the discussion these will be divided into two groups, first, goods manufactured for stock, and secondly, those made on a specific contract or for special order. To the first group the principle of cost applies without any qualification. The problem involved is that of determining what has constituted cost up to that particular stage of completion. Where a detailed cost system is in use and a production schedule forms part of the system, it is possible at almost any moment to ascertain exactly the values accumulated on any article at each stage or process of manufacture. Where definite costs are not possible, a careful estimate based on full knowledge of conditions is the best that can be done. Where parts are first manufactured for assembly into a completed whole, they should be treated as finished goods and valued at full cost up to that point.

Contracts. The second group of goods in process, viz., those manufactured to fill specific orders, or, in large construction work, contracts taken but not completed, may be valued on a somewhat different basis from that applicable to the first group. Here a sale has actually taken place and only the intervention of the closing of the books raises the question of valuation. In a case of this sort it is customary to make a careful estimate of the costs of the work or contract, up to its present state, due weight being given to remaining costs necessary to complete it and to any provision for possible contingencies. When handled in this way, the estimated profit on the work already done is said to be applicable to the current period and is therefore taken into account. In other words, the portion completed is treated as sold, after making the provisions indicated above, and is charged off the books against a

corresponding part of the sale price. Hence, the valuation involved here does not concern the inventory, but the cost of goods sold.

It may be objected that, in the case of large contracts, perhaps running over a period of years, many unforeseen things may happen to wipe out any seeming profits on the completed portion, and that conservatism would demand that no profits be taken until the contract is completed or in a sufficiently advanced stage as to be reasonably sure of results. In such a case it frequently happens, however, that not only are stockholders impatient of delay, but very serious injustice may result to any who might be forced to give up their holdings before the completion of the contract. Moreover, a fair method of making payment on the contract is usually in force, the sale price often being on the basis of units of work accomplished, so that the contingencies giving rise to the objection mentioned are greatly minimized. Thus, some contracts may be on a fixed price per cubic yard of earth removed, per unit of goods manufactured, or other similar basis for periodic payment, a certain per cent being retained as a guarantee for the satisfactory completion of the whole. Again, where the price is for a lump sum, engineers representing the contracting parties may agree on the amount completed and periodical payment may be made on that basis.

This topic of uncompleted contracts will come up again for treatment when considering the profit and loss summary for the year. It is sufficient to note here that some share of the profit on the completed portion of a contract may be taken as indicated above, in which case the inventory problem may be disposed of either by adding the amount of estimated profit to the cost value of the uncompleted contract, or by treating the payments made as sales.

Contracts and Length of Cost Period

In some lines of business, orders are booked several months ahead of delivery date, the factory operations depending somewhat closely on the contracts entered into. During the period of manufacture there may be few deliveries of the product, and therefore no actual profit. Obviously, the easiest method of handling such a situation is to make the fiscal period long enough to include the greater part of the deliveries, and so leave the inventory comparatively free of goods in process. Where this method is adopted, there is no serious objection to valuing the goods still in process at the close of the period so as to take a fair portion of the profit, although conservative practice usually values them at cost. The difference in the amount of profit under the two methods is insignificant under the condition named. Under other conditions valuation at cost is the rule.

Valuation of Scrap

Raw materials are never completely used up in manufacture; portions too small for the main product, corners, odd-shaped pieces, defective pieces, etc., are usually thrown into scrap. This scrap is frequently utilized in the manufacture of side lines if a market can be developed; otherwise it may be valueless. The problem of the valuation not only of the scrap but of any product that may be made from it presents some interesting features. If the entire cost of the raw material is charged to the main product, the scrap material used in the side line costs nothing, and to charge anything for it, either on the basis of cost or some arbitrary estimate, would result in inflation. Furthermore, the cost figures of a side line which is not charged for material might at some time be made the basis for a bid on a contract too large to be filled entirely out of scrap material, and so result in a loss. On the other hand, if the main product is charged only for the material actually consumed, and the side line is compelled to bear the cost value of the material it consumes, the cost of the side line may so increase that it cannot be marketed at a profit. The lowered cost of the main product might lead, in the face of keen competition, to the cutting of its price below real cost, unless, of course, all the scrap is being utilized in the side line which is also being sold at a profit. If such is the case, the valuation of the main product, the side line, and the scrap should be on a cost basis. This is not usually the case, however. No basis for valuation can be found which will prove entirely satisfactory under all circumstances.

In the light of the conditions involved, particularly as to whether there is a constant market for the utilization of all the scrap material in the manufacture of the side line, each concern must adopt whatever policy best suits its peculiar needs. At all times the application of materials costs to the product should provide an intelligent basis for entering into future contracts. A _blind_ use of cost figures frequently invites disaster. In cases where scrap is not utilized in a side line, it has only scrap value. The thing to guard against is the double charge for the same material, i.e., a charge to the main product and also to the side line, resulting in an inflation of values.

Inventory-Taking

There remains, as a corollary to the problem of valuation, a consideration of the method of taking the inventory, for if the count is wrong the most careful valuation per unit will not give true total value. In connection with the count of the inventory, two

fundamental rules must be observed. These are: (1) make sure that everything, i.e., all stock-in-trade, belonging to the business is included; and (2) be careful that there is no duplication of count nor inclusion of any stock belonging to others.

In accordance with the first fundamental rule, care should be exercised to include all goods out for sale in other markets—these to be valued at full cost in those markets—and all goods not yet received into stock but belonging to the business. These latter include goods invoiced but not received, and goods received but not unloaded prior to the close of the period.

In accordance with the second fundamental rule, any goods of others held for sale on a commission basis must be carefully excluded from the count, as should also goods received before the close of the period but with invoices dated some time in the future. Furthermore, all goods inventoried from their invoices, i.e., all goods not taken into stock, must be earmarked so as not to be charged into the next period's purchases. This is best accomplished by stamping the invoices as "Included in the 19.... Inventory."

Inventory Methods. The careful organization of the physical stock to be inventoried, sorting any misplaced items, and separating them into classes, and an equally careful organization of the clerical force, acting under explicit directions based on a well-thought-out plan, are fundamentally essential to accuracy and to the prevention of any duplication of count. In some cases the use of duplicate or coupon tags proves very valuable. On these tags provision is made for recording in duplicate the number of units and condition as to salability, and they are ruled with two money columns. The tags are numbered on both parts consecutively and are charged out to the various departments, as many being issued as there are classes or compartments of goods. As the count is made of a certain class of goods, a tag is attached to the compartment or other storage place as evidence that the count has been made, after which the lower portion is torn off and sent to the office. Any missing numbers indicate omissions in the count. If the card has been lost, the duplicate still attached to its compartment will indicate the count. After all cards are accounted for, the duplicates are detached and the goods covered by them are then released for sale or other use. In taking the inventory it is especially important that where goods are below normal as to salability, their estimated per cent of normal condition be noted on the tag. This gives a basis for valuing and should show the amount of deterioration and its cause.

Perpetual Inventory

The use of a perpetual inventory system is quite general in some lines. Its operation requires almost as careful a record of stock as is made of cash, i.e., not only must all receipts be recorded but all disbursements as well. In a trading concern this record usually takes the form of a stock book of some sort, to which entry is made, as to quantities only, from the purchase and sales invoices, the balance shown at any time being the stock remaining on hand. The application of the unit value gives the value of the entire stock and so makes possible monthly statements of approximate condition. In a factory, a separate stores ledger may be operated, carrying an account with every kind of material used. This ledger is controlled by the Raw Material or Stores account on the general ledger. Entry to the stores ledger accounts is made from the purchase invoices for receipts, and from formal requisitions drawn on the stores-keeper for disbursements, i.e., for the issuance of material. The stores ledger may record not only quantities but also values, so that its balance should be the value of the stores on hand. This is possible because the material is drawn out at cost price.

Oftentimes, for retail concerns, instead of the stock book method, the percentage method of book inventories described in Volume I, page 506, gives more satisfactory results when sufficient past experience can be drawn from.

Necessity of Physical Count. It must not be assumed that a perpetual inventory system obviates the necessity of taking a physical inventory, for it does not. All that it accomplishes is to secure a closer supervision over stock between inventory times and to make possible the showing of approximate results at interim periods. Where operated, it is possible to take the physical inventory piecemeal, although there is a marked advantage in taking a complete inventory periodically. The piecemeal method means that any department can do its stock-taking during a slack time without regard to the time when other departments take theirs. Thus there is less interference with the regular conduct of business. It must be borne in mind, however, that the physical inventory is just as essential as ever because of the many inaccuracies that tend to creep into the perpetual inventory system, and furthermore because of loss, theft, over-measure, and so on, which throw the book record out of agreement with the actual count.

CHAPTER XIV

TEMPORARY INVESTMENTS; ACCRUED AND DEFERRED ITEMS

TEMPORARY INVESTMENTS

Nature of Temporary Investments

The next item to be considered for valuation in the current assets section of the balance sheet is temporary investments. These are assets, such as stocks and bonds of ready marketability, in which current funds are tied up temporarily. Investments in stocks and bonds for purposes of securing business connections and privileges essential to the most efficient conduct of the business do not belong to this category. The term usually covers only those assets representing the investment of temporarily surplus cash or those acquired in settlement with debtors with the expectation of early realization. As A. L. Dickinson[44] so well says, “such investments have no relation whatever to the business and can be disposed of without in any way interfering with its earning capacity, other than the loss of the dividends thereon.”

[44] In “Accounting Practice and Procedure.”

In the case of concerns affected by seasonal changes in volume of business, there are periods when sums of surplus cash lie unemployed, unless the concern depends upon borrowed money to take care of seasonal increases. Business policy, therefore, demands that the surplus cash be put where it will earn something. Such investments are frequently of a somewhat speculative character. In fact, other things being equal, business acumen demands that the investment be made in those securities in which there is a chance of gain in addition to the regular income therefrom. It cannot be stated too strongly, however, that safety, freedom from great fluctuations, and ready marketability are always prime essentials to be observed in securing stocks and bonds for temporary investment. While the procedure is unusual, there may at times be circumstances under which such investments may be bought on a margin basis.

Valuation of Temporary Investments

The usual rule for valuing temporary investments at the time of drawing up a balance sheet is at cost or market, whichever is the lower. Inasmuch as they may be needed on short notice, the information desired is what they will be likely to realize. This is particularly true in the case of a concern with a rapidly expanding market, for which provision may need to be made by increasing the plant as well as the working assets. Where reserved profits have become tied up in fixed plant, the need for ready funds is apparent.

It may be argued that inasmuch as realizable value is the information desired, valuation at market, whether lower or higher than cost, is the only proper basis. The rule stated is, however, held to be the correct one from the standpoint of conservatism and the further fundamental objection to bringing unrealized profits into the current period, as would result from a market valuation higher than cost. Of course, a lower valuation than cost brings unrealized loss into the period’s operations, but this is not regarded with the same disfavor. Where the market price is fluctuating from day to day, as is normally the case, the market valuation on the date of the balance sheet is perhaps no nearer to the amount that will be actually realized than the cost value, since cost value merely represents one of the many changing points in the market. If a distinct market tendency in one direction or the other were likely to continue until the time of realization on the investments, there might be good reason for taking the profit or loss accrued to the date of the balance sheet. However, these considerations are of too speculative and uncertain a character to be given any weight.

There is some valid objection, on theoretical grounds at least, to the results of the period being affected by the unrealized profits or losses caused by taking the market valuation of temporary investments onto the balance sheet. Valuation at cost, with a footnote to show market value, gives all the information essential to a full understanding of the exact condition of the investment. The habit of adding footnotes to the balance sheet may, however, become objectionable and the practice is to be avoided wherever possible. Also, really essential information usually carries greater weight when incorporated in the balance sheet figures.

Reserve for Investment Fluctuations

To meet the foregoing objection and, at the same time, that of allowing unrealized items to affect the period’s profit and loss, use may be made of an account called, say, “Reserve for Investment Fluctuations.” The account should be operated in the same way as the Reserve for Market Valuation of Merchandise discussed in the preceding chapter. That is, if market is lower than cost, at the close of a fiscal period, surplus is charged and the reserve credited for the difference. On the balance sheet the reserve is treated as an offset to the investment account carried at cost. This incorporates the market valuation as a significant figure of the balance sheet and shows the cost for purposes of information. The charge to surplus avoids fluctuation in the current profit and loss results because of an unrealized item and so makes it more useful for comparative purposes. In case market is higher than cost, the

difference is charged to the asset and credited to the reserve. On the balance sheet, cost is thus the effective figure and the market price is given for informational purposes. When the investment is sold, the entry creating the reserve should be reversed in either case. This brings on the books in the period when the sale takes place, the actual profit or loss realized, being the difference between cost and sale prices. The adjusting entries on account of valuation do not thus permanently affect surplus, while the actual profit or loss reaches surplus in the usual way—a valuable desideratum.

“Stock Rights” on Investments

It may occasionally happen that while stocks are held for purposes of temporary investment, stock rights arise. Such a “right” is a privilege of subscription to a new issue of stock, granted holders of stock on a certain date, at a rate below the market quotation of the old stock. The stock records are closed temporarily to any transfers of stock in order to determine those entitled to these rights. Up to the date of closing the records, the market value of the stock carries an increased value to cover the value of the rights belonging to it, and the stock is quoted “rights-on.” After this date the rights are dealt in separately and quoted separately on the exchange. Stock then sells “ex-rights.” Should the end of the fiscal period of a concern holding stocks subject to rights fall after their issue, the stock and rights may be booked separately, though often shown together.

An illustration will show the theoretical method of valuation of rights. Take a corporation whose stock now sells at 125, issuing the right to subscribe at par for additional stock to the extent of 10% of present holdings. The case of a stockholder with fifty shares would work out as follows:

50 shares at $125 $6,250.00 5 ” at 100 500.00 -- --------- 55 ” at a cost of $6,750.00

The average cost of one share is $122.73. Based on the former quotation of $125, the right is seen to be worth theoretically the difference, or $2.27. The quoted market price will usually be less.

Cost of Investments

In connection with the cost of temporary investments it may be well to point out that cost means full cost to the purchaser, including brokerage and other costs in connection with the purchase or subsequent thereto. If the investment is being carried on margin, the customary practice is to charge to the investment account the interest on the funds borrowed by the broker to finance the transaction and to credit thereto any dividends or interest received. The difference between the asset account kept with the investment and the liability account with the broker thus shows at any time the original equity in the investment. A credit to the investment account when the stocks are sold develops the net profit or loss on the entire transaction. There may be circumstances under which it will be desirable to separate from the asset account all charges and credits subsequent to the original purchase, carrying them in a suitable expense and income account.

Valuation of Bonds

In the case where bonds are held for temporary investment, purchased either at a premium or discount, it is not customary to take account of amortization, because the investment is temporary. The problem of amortization is postponed to Chapter XV, in which permanent or long-term investments are treated.

In brokerage firms, where stocks and bonds comprise the stock-in-trade, the same principle of valuation applies as with a merchandise stock except that the rule of valuation at cost or market, whichever is the lower, is applied to each _individual_ holding. In this way, decreases in the value of one stock are not offset by increases in the value of others as would be the case if total market and cost values for the entire lot were first determined and then the valuation formula applied. In this chapter the principle of valuation of stocks and bonds as stock-in-trade is mentioned only by way of contrast.

Valuation of Unissued Stock

Under the head of temporary investments, the company’s unissued and treasury stocks or bonds are sometimes included. Such unissued stocks or bonds manifestly represent an inflation of asset values, offset, it is true, by an equal inflation of capital stock. In the first place, conceding for the sake of argument that the inclusion of unissued stocks among the assets is legitimate, the principle of equilibrium requires that they be valued at par on the balance sheet, a figure which is not cost and which may be very far from market. Again, the company’s unissued stocks may be in no sense current assets. Furthermore, stocks which have never been issued have no owners and so can command no proprietorship in the enterprise. The most that can be said about them is that they

are contingent assets, showing that certain legal formalities have been met which authorize their issue if so desired. The remaining necessary procedure, viz., that the stock be placed on the market and sold, is, however, the condition which must be met to create a real asset and to create proprietorship. Until that has been done there is neither proprietorship nor asset. Reference to Volume I, Chapter XLIX, where the various methods of opening the books of a corporation are illustrated, will show that the method to be preferred is one which eliminates the account Unissued Stock from the books. However, where it is set up, correct classification would seem to require that it be treated as of the nature of a valuation or offset account for capital stock. In other words, the two accounts, Capital Stock and Unissued Capital Stock, must be read together to show the true status of the proprietorship stockholdings. The correct method of presentation on the balance sheet is here only indicated but will be illustrated in Chapter XXI where the problem of valuation of capital stock is treated.

Valuation of Treasury Stock

The case against the inclusion of treasury stock in temporary investments is not quite so apparent, but equally convincing upon examination. Treasury stock differs from unissued stock only in that it has once been issued but has, through various channels, found its way back into the possession and control of the company. While outstanding in the hands of stockholders and under their individual control, the increased stock proprietorship is reflected in increased assets. If the stock comes back into the treasury through donation, the decrease in proprietorship stockholdings is compensated by a new proprietorship element under donated surplus. Thus, while there are not so many shares outstanding, the value of each is enhanced by a combined or common proprietorship in donated surplus, which reflects exactly the status of the treasury stock. Whereas formerly there was individual control over the stock, now that it is in the treasury, control is common or combined. Stock proprietorship has been diminished and the balance sheet should show it by treating Treasury Stock as an offset account and not as a part of current assets under Temporary Investments.

As to the valuation of treasury stock at some other figure than par, the same argument holds as in the case of unissued stock. If the treasury stock has been acquired by purchase on the open market, its price may be a good and sufficient basis for valuation; but even here individual ownership and control has been exchanged for common and combined ownership. The individual stockholdings are decreased, and the decrease is reflected on the assets by the amount paid for the stock. It would seem, therefore, that a showing more in accord with the facts would require treasury stock to be treated as a deduction from the capital stock authorized. Thus the best practice eliminates a company's own stocks from the list of its assets. Where such holdings are small and insignificant, they may without any serious impropriety be included among the assets and even under the caption "Temporary Investment" so long as substantial accuracy obtains.

Summary of Valuation Formula

To sum up, then, the valuation formula for current investments requires their showing at cost or market, whichever is the lower. The most satisfactory method of applying the formula is by means of the Reserve for Investment Fluctuations which makes possible the incorporation of market value whether lower or higher than cost, with the differences between market and cost carried in the reserve account. Thus the conservatism of the valuation formula is made effective and at the same time information is given as to the present market values of the investment.

ACCRUED AND DEFERRED ITEMS

Nature of Accrued Income

Income derived from many different sources is never fully received at the close of the fiscal period. For instance, of the sales made many will still be outstanding as charges to various customers; interest will have accrued on notes receivable and on investments held; rental income is earned day by day but is received only periodically; royalties based on the use of some machine or process are accumulating where the device or process is being used but settlement is made only periodically; and dividends on stocks or other investments may have been declared during the current period but are not payable and therefore will not be received until the next period.

Inadequacy of Cash Method of Handling Accruals

All these accrued items give rise to claims which must find expression in the accounts either currently or ultimately. In the case of sales of merchandise the customary practice is to set up the claim on the books when the sale is made. In the case of the other

items usually no record is made until the income is actually received. Under this method—called the cash method—it is evident that the true income cannot be shown in the period in which it is earned and that the period in which it is received secures the credit for it. This means not only that the current period may at its beginning receive credit for items of income mostly earned during an earlier period, but at its end it will be deprived of similar earnings accruing from day to day up to its close but not credited because their time of payment overlaps into the next period. This method is defended as being substantially correct on the principle of averages, i.e., those earnings which do not entirely belong to the current period but for which credit is taken will in the long run just about offset the earnings accrued at the end of the period which are not taken account of.

The statement may be true and, if so, can be easily tested; but, whether true or not, modern practice requires the _accurate_ accounting of all claims. It is therefore required that these accrued earnings be brought onto the books if reliable results are desired.

Correct Method of Handling Accruals

To show all earnings in the period in which they actually accrue is called the “accrual method.” Under this method the income earned but not received during the current period is set up among the assets, just as in the case of sales, with this difference, however: the claim for the broken portion belonging to this fiscal period need not be recorded day by day but only at the end of the period. Most income items of this sort are due, either by contract or by custom, at the end of certain definite periods. The setting up of a claim for a broken, i.e., an uncompleted portion, does not mean that such a claim is on that date legally enforceable, but that it is a claim equitably belonging to the current period.

Showing of Accrued Items on Balance Sheet

As to the section of the balance sheet in which these accrued income items should be shown, usually they are true current assets and should be so listed. They frequently arise in connection with current assets, e.g., the interest accruing on notes, stocks, and bonds held, and are therefore just as current as the assets themselves, or even more so. Where not so arising, as in the cases of rents, royalties, etc., usually the contract or customary period of settlement is so short as to make the claims under them true current assets. Occasionally the accrued earning is added to the value of the particular asset and so shown in the balance sheet. A better practice, because more definite, is to list them separately under the title, Accrued Income, Accrued Accounts Receivable, or other similar title.

Valuation of Accrued Items

The principle of valuation of accrued income items is apparent. On the supposition that the concern will continue in business, the accrued income is proportioned between the two periods on the basis of the portion of the time belonging to each period. However, this does not mean that the portion so taken shall be valued at its face. The accrued portion is worth as a portion neither more nor less than the whole is worth as a whole. If there is doubt as to the ability to collect it when it falls due, certainly the valuation placed on the accrued portion should express that doubt. In other words, unless the claim is fully secured by collateral or other pledges, valuation should be on exactly the same basis as for the other receivable items, such as the claims against trade debtors, other open accounts receivable, notes receivable of various kinds, etc.

Accounting for Accrued Income

The accounting for accrued income presents no particular difficulties. In addition to the two methods discussed in Volume I, pages 116 to 119, a third which is considerably more laborious than either of them is frequently employed, and is as follows: At the time of adjusting and before closing the books, for every item of accrued income a separate asset account is set up. Thus, for royalties an account, Accrued Royalties Receivable, would record the claim on account of royalties at the same time the accrued income from royalties is being recorded in a suitable income account. Thus there is distinct separation of the asset and income elements.

From this point two methods are in use for handling the subsequent record of the item. Under the first method, the income when actually received or legally due is recorded in the regular income account. This thus shows an inflated figure because it is not offset by the portion credited to the previous period, the asset account covering this, remaining unchanged throughout the current period. At its close, however, proper adjustment is made by adding to, or subtracting from, the amount held over from the close of the previous period such an amount as will make its new balance show the correct amount of accrued income as at the close of the current period. The contra credit or debit to the above entry, as the case may be, is of course to the particular income account,

causing it to reflect the true income for the current period.

Under the second method, the first entries for the new year consist in transferring all accrued income asset balances to their respective income accounts, where they serve the purpose of automatically adjusting the full receipt of income a portion of which was credited in the previous period, to the amount properly belonging to the current period. At the close of the period any adjustment on account of accrued income is handled by debiting the asset account and crediting the income account exactly as before.

An illustration will show the differences between the two methods.

Illustration of Different Methods of Recording Accrued Items

Problem. The royalties income accrued December 31, 1916, amounted to $5,000. During 1917 payments were received on account of royalties to the amount of $35,000. On December 31, 1917, accrued royalties were $5,250.

Solution—Method 1

ACCRUED ROYALTIES RECEIVABLE ========== 1916 | Dec. 31 $5,000.00 | 1917 | Dec. 31 (A) 250.00 | |

ROYALTIES INCOME ========== | 1917 | $35,000.00 | Dec. 31 (A) 250.00 |

Method 2

ACCRUED ROYALTIES RECEIVABLE ========== 1916 | 1917 Dec. 31 $5,000.00 | Jan. 1 (A) $5,000.00 --------- | --------- 1917 | Dec. 31 (B) $5,250.00 | |

ROYALTIES INCOME ========== 1917 | 1917 Jan. 1 (A) $5,000.00 | $35,000.00 | Dec. 31 (B) 5,250.00 |

Of the two methods, the second is somewhat fuller and probably presents the facts more consistently, although involving a little more book work. From a practical standpoint where regard is had to the amount of book work required, the method used in Volume I, pages 116 to 119, sometimes known as the inventory method, serves all the purposes of either of the above methods and requires much less work. By it the above problem would appear as follows:

ROYALTIES INCOME ========== 1916 | 1917 Dec. 31 Accr. $5,000.00 | $35,000.00 1917 | Dec. 31 Accr. 5,250.00 Dec. 31 P. & L. 35,250.00 | $40,250.00 | $40,250.00 ======== ========== | ======== ========== 1918 | Jan. 1 Accr. $5,250.00 |

An objection, not at all serious, is that under this last method the ledger will show, as on the date of the balance sheet, the current assets in two places, viz., the current assets section and the income section, instead of altogether as under the other methods. This objection is more than offset by the saving in clerical labor. There is in some quarters an all too prevalent tendency to multiply the number of accounts and increase the bookkeeper’s work without any adequate return in results.

Prepaid Items—Definitions and Kinds

Closely related to current assets, because through an overexpenditure of current funds this period a lesser expenditure will be required next period, is the class of items known as prepaid expenses or deferred charges to operation. These items are not current in the sense that they will be turned into cash shortly, but they are analogous in that a saving in the expenditures of the next period will result. Because of the ease with which they may be put to improper uses, it is best to segregate them from current assets under a suitable balance sheet caption, such as “Deferred Charges to Operation.” Where the two captions, Current and Working Assets, are shown, items of this class properly belong to the latter. Under this head will be considered such items as supplies of all sorts—office, factory, power house, stable—stationery, printing, postage, repair parts, insurance unexpired, advertising contracts and material, rent, royalties, interest and discounts paid in advance, salary overdrafts, premiums on long-term investments and discounts of long-term obligations, and sometimes organization expense, although this last item is perhaps best handled with the intangible assets.

Valuation of Prepaid Items

The purpose in considering these items at the close of a fiscal period is to secure a proper and accurate allocation of charges as between the two periods, without which true results as to profit and loss are not possible. The same argument as to these items averaging up fairly well between periods applies here as for accrued income. The only other point to be considered in connection with them is the basis for their valuation. Realizable values, i.e., what the items would bring under the hammer or at other forced sale, are manifestly inequitable. A three-year insurance policy with one year expired is to a concern which intends to avail itself of the remaining two years' protection worth more than the surrender value of the policy calculated on the short-rate basis with perhaps the expenses of doing business also subtracted by the insurance company. Evidently to a going concern the protection enjoyed for the year just expired is worth neither more nor less than a pro rata share of the entire cost, nor are the remaining two years' protection to be valued at a less rate because redeemable at a less rate.

Hence, a valuation based on the going concern principle is to be used for deferred charges. As indicated above, this means, when used in this connection, a pro rata valuation based on the life of the supply and the portion unused. In the case of tangible supplies the rule can be most easily applied as a unit cost figure to the unused units still on hand. That is, an inventory of supplies is taken and valued at full cost. Although nearly related to current assets, deferred charges are seldom influenced by market fluctuations after they are once purchased, because if properly classed as deferred charges they are always held for own use and never for outside sale.

Danger of Overvaluation

Care must always be exercised—even more than in handling the stock-in-trade inventory—to see that there is no padding of this class of items. To this end, before taking inventory, a general clean-up of supply materials all over the plant is an exceedingly good policy. This should result in discarding, or reducing to scrap value, all obsolete and unusable supplies. Without such a clean-up it is easy, even when motives are of the very best, to carry forward from year to year as assets supply materials which will never be used and which are therefore nothing but expense items and should be charged against operation. Only a careful periodic appraisal of supply materials and an equally careful inventory indicating their usability can give a correct basis for applying the valuation formula.

Two or three items of deferred charges need a word of further explanation. In some mining industries, notably coal and precious metals, leasing is done on a royalty basis with a minimum amount to be paid each period based on a minimum production of ore to be mined. If less than the minimum is mined, a frequent provision in the terms of the lease makes possible the application of any royalties overpaid one period against a future production of more than the required minimum. That is, no increased royalties are charged for a production over the minimum until all accumulated royalties from periods of underproduction are used up. In any period of underproduction such royalties may properly be treated as deferred charges only on condition that there is reasonable expectation that future production will increase to the point where it will consume the overpaid royalties of earlier periods. At times a company finds itself bound to such a contract, based on a minimum production, without any hope of relief because the prospect has not developed as anticipated. Under such conditions the entire periodical royalty charge is a charge against operation and must be absorbed entirely by the operations of each fiscal period.

Accounting for Deferred Debit and Other Items

The accounting for deferred debit items proceeds along the same lines indicated for accrued income. Nothing further need here be said than that such items as insurance, supplies of various sorts, etc., are frequently recorded originally as asset items instead of as expenses. At the close of the period so much of each of them as has been used is transferred to suitably named expense accounts and is thus taken into profit and loss. There is no objection to this and it usually works out very satisfactorily, although the usual practice is to treat all items of this class as expenses rather than as assets. This method is usually prescribed by regulatory commissions in the case of public utility companies.

The treatment of premiums paid on long-term investments and of discounts arising through the marketing of long-term obligations at a figure below par is reserved for consideration in the next chapter where their relation to the interest account and the problem of amortization will be considered.

CHAPTER XV

PERMANENT INVESTMENTS

Nature of Permanent Investments

As distinguished from the type of investment discussed in the preceding chapter, investments of a more or less permanent character will next claim our attention. These may be permanent in the sense that at the date of the balance sheet they have a long term to run before they mature and the expectation is they will be held for a considerable period of time; or permanency may be indicated because ownership of the investment is necessary or, at least, a valuable requisite to operation. Ease of conversion into cash may or may not be a characteristic of such investments, and certainly it is not a determining test for valuation as is the case with temporary investments, discussed in Chapter XIV.

The necessary test is always the condition in which the company would be placed, viewed from the standpoint of efficient operation, if the investment were disposed of. If its efficiency or its contracted or moral obligations would not be impaired, the investment may be said to be of a temporary character. Examples were given in the previous chapter. If, however, its efficiency would be materially affected, or its continuance as a business be hampered or threatened, then the investment must be considered as of a permanent character. This latter type of permanent investment will be discussed first, followed by a consideration of the long-term securities (bonds, stocks, and land) held as investments for certain funds (such as the building fund, bond and redemption fund, etc.).

Permanent Investments as an Aid to Operation

These permanent investments may take the form of ownership of the stock or bonds of other corporations, as in the case of the holding company. They may represent interests, active or silent, in partnerships; or they may take the form of advances of working capital or funds to other concerns. Whatever the form may be, and whether evidenced by formal securities, collateral, or merely by open book accounts, they serve the purpose of securing some essential facility without which operation could not be successfully carried on. A newspaper may secure full or controlling interest in a paper mill to insure its supply of print paper; a railway may become a heavy owner in a terminal company in order to give it terminal facilities; a refinery may purchase a controlling interest in an oil production company in order to give it a sure supply of crude oil; etc. Thus, the permanent or fixed investment is always a means of bringing about the efficient operation of a business. It may be effected in any one of three ways, viz.:

1. By practically full ownership of the subsidiary enterprise to secure complete control and so direct its policies. 2. By only a controlling ownership. 3. Through the agency of advances, particularly when, because of poor credit, the usual money markets may be closed to the borrowing company.

Valuation of Permanent Investments

The problem of the valuation of investments under the three forms mentioned presents some interesting features. It might seem that, inasmuch as the investment is in the nature of a fixed asset, valuation should always be at full cost; that market fluctuations should have no effect. The last half of this statement is correct but the first part needs modification. It is to be expected that a concern in purchasing the stock of another will not pay more than it considers the stock to be worth. The price may be more or less than the face value of the stock, depending upon the existence of an element of good-will or the overstatement of the assets on the books of the vendee company; or again, where the stock is bought on the open market many other factors may cause a variance of purchase price from par value of the stocks.

Were the investment simply an inanimate asset to be used, cost, perhaps less depreciation, would be the proper basis for valuation. Since, however, a corporation cannot remain stationary—it must usually record a gain or a loss from year to year—ownership in that corporation must accordingly suffer change from year to year. So many things can happen to an operating corporation that cannot befall an inanimate asset held for use that the proposal to value both on the same basis is hardly tenable. Furthermore, if proper principles of valuation are applied to the subsidiary concern, its true value can be determined with fair accuracy. Accordingly, a true basis is secured for valuing it as an investment on the books of the holding company. Any increase in value over cost is due to the profits made by the subsidiary enterprise, and in the case of its complete ownership by the holding company these profits belong in full to the holding corporation. If all the profits are disbursed as dividends to the holding company, the subsidiary enterprise suffers no change in condition and therefore no change in value. If, however, some of the profits are retained, this would result in an increased value which should be reflected in the valuation of the subsidiary enterprise on the books of the holding company. How this may best be shown also requires consideration.

Holding Company and Subsidiary Enterprises

A holding company may have but few assets aside from its holdings in subsidiary concerns. A balance sheet showing only these few assets and its investments in the other concerns does not usually give much useful information. Therefore, as the assets of the subsidiaries belong to the holding company and really comprise its operating plant, a more intelligent way of showing the investments of the holding company is to combine or consolidate the balance sheets of the subsidiaries and incorporate them in the balance sheet of the holding company in place of the item of investments. This method is known as the “consolidated balance sheet” and is given fuller treatment in a subsequent chapter. Here attention is called to it merely as a device for showing the valuation of permanent investments represented by substantially full ownership of the subsidiary companies.

Controlling Investments

Where ownership is not complete but still controlling, the method of the consolidated balance sheet is not so fully applicable and often is not used. In this case the investment will appear as such on the balance sheet with whatever adjustments in value may be necessary due to the success or failure of the subsidiary’s operation for the past period. Whatever profits are made enhance its value and in the enhanced value the controlling company has a pro rata share, the effect of which should be taken up in the valuation of its investment therein. The net amount of the enhancement in value is the difference between the net profit made by the subsidiary concern and that portion paid out in dividends—in other words, the portion reinvested in the business.

This portion, i.e., such part of it as belongs to the controlling company, may be taken up directly by charging the investment account and crediting a proper income account; or the share of the entire net profit belonging to the controlling company may be charged to the investment and credited to an income account. In the event of dividends being paid by the subsidiary company, these would be credited to the _investment_ account of the controlling company, which account would then show, as in the first method, the new value due to the profits reinvested in the business. That this policy of increasing the value of the investment is conservative and sound is apparent when one considers that the holding company’s ownership of the subsidiary concern controls the latter’s policies, including the dividend policy. The profit taken onto the books of the holding company by the above method is a real, not a book, profit.

Advances to Subsidiary Concerns

Where control is secured through the medium of advances made on open account or by means of such advances together with ownership of stocks and bonds, a valuation must be made of these claims separately from the stocks owned. Where ownership is complete and valuation is shown by the consolidated balance sheet method, intercompany accounts and claims are, of course, eliminated and so do not show. In all cases, however, where claims against a subsidiary arise on account of advances, or even of sales, and these must be shown on the balance sheet of the owner of the claims, more than average care must be taken in placing a value on them. In the case of advances, frequently their exact status is not known at the time when made. The record is carried in a suspense account until its final status is determined, when record is made accordingly. The advance may be temporary, for the purpose, say, of enabling the subsidiary concern to take advantage of very favorable market conditions in the purchase of raw materials, in which case, of course, the claim is a current asset; or possibly the subsidiary company is about to make additions to plant and equipment and is financing the expansion temporarily by means of borrowings from the parent company. Whatever method of permanent finance is finally settled upon, this should convert the open-account claim of the parent company on account of advances, into the regular securities or obligations of the subsidiary concern. Again, it is unfortunately true that advances to the subsidiary company often become necessary to recoup it because of operation at a loss. This may continue with little hope of repayment for years to come, if ever. The parent company may ultimately lose all the funds advanced to the subsidiary company because of the latter’s financial instability.

Rules for Valuation

Because of the many factors involved, it is apparent that no absolute rule can be laid down for valuing the advances to a subsidiary enterprise. Each case will require careful investigation and must be settled on the basis thus established. If the investigation shows the loan to be temporary with good expectation of its full return, it should be shown at its face value among the current assets. If the advance is to be converted into the securities of the subsidiary concern and the latter is in good condition, the advance may be carried at par among the fixed assets. When the securities are received they should be valued as any other permanent stock investments, with due regard to the basis of conversion in comparison with the value of the securities given in settlement. If

conditions upon examination are found to be serious, it may be necessary to treat advances made as expenses, i.e., they are of no realizable value. If the bankruptcy of the subsidiary concern seems probable, a question of financial policy and law arises, viz.: whether the interests of the parent company are best conserved by allowing its claims to remain on open account and so rank with other creditors, or to be converted into stock and rank with those of other owners. It may be necessary to take that phase of the matter into account when determining the value of claims against the subsidiary concern.

Investments in Partial Holdings

For the sake of business connections, prestige, and good-will, oftentimes more or less permanent investments are made of such a nature or in such amounts as not to secure a controlling interest. Here, because the reins of business control are not held by the investing company, manifestly such an investment is on a very different basis from those in companies whose control is held by the investor. In the one case, business policy can be determined and made effective; in the other case, success or failure is under the control of others. Accordingly, the valuation of these partial holdings differs from investments in companies entirely owned or controlled by the investor. Where the holdings of these minor interests are not particularly substantial in comparison with other properties owned, there is no serious objection to valuing them at cost. They are held to secure certain benefits, and so long as the real values of the companies concerned are being maintained or enhanced, there is little probability of the investment being disposed of. Market fluctuations, therefore, should be given little or no consideration. Where, however, partial or minor holdings form a comparatively large portion of the investments, it may sometimes be wise to value them on the same basis as temporary investments of a current nature. In this case the profit or loss attendant upon bringing market values into the books should be handled as with temporary investments.

Where investments of this kind are shown on the balance sheet at cost, it is sound policy to call attention in a footnote or otherwise to their market values, as oftentimes the market gives some indication of the condition of the company. The savings banks of the State of New York, in reporting to the State Department of Banking, must show the market value of the securities held. Usually three values are shown, viz.: market, par, and so-called investment value, to be explained later. Where the securities held are not listed on any exchange or are held closely and not traded in extensively, it is often difficult to secure reliable market quotations for them. Here cost, unless known conditions demand otherwise, seems the best basis for valuation.

Investments Producing No Income

Some investments may be of a permanent type and yet of themselves produce no income. Such are memberships on stock and produce exchanges, boards of trade, and the like, which are valuable for the privileges and prestige accruing therefrom and the business associations secured thereby. They should usually be valued at cost, thus allowing the period in which they are sold, if disposal becomes necessary, to get the profit or loss incident thereto.

Bond Values and Market Interest Rates

In connection with the valuation of bonds, some additional considerations should be taken into account. Assuming that the margin of security for the mortgage covering the bonds is ample, the value of a bond, i.e., its price on the market, is largely dependent upon the prevailing interest rate in the money market. Thus, if a bond bearing 5% interest is offered for sale in a market where the rate is 6%, it can be sold only at a discount sufficient to provide approximately 6% on the money invested. Similarly, a 6% bond offered in a 5% market should bring something more than par. It is not intended to convey the impression that whenever a bond sells below par it is because the market is demanding a higher rate than that offered by the bond; nor when a bond sells at a premium need the entire amount of the premium be a reflection of money market conditions. An additional factor is oftentimes the credit standing of the issuing company. Thus, even though a bond may be amply protected, the poor credit rating of the issuing concern will be reflected in a downward tendency of the price of the bond, for under such circumstances foreclosure proceedings preliminary to sale and conversion of the security always loom large in the background. On the other hand, bonds of the United States are often above par because of the government’s credit standing.

On the assumption that there is reasonable expectation that the bonds will be paid at maturity, their valuation on the balance sheet during the time they are held by an investor must have regard to the price paid as determined by the bond interest rate and the money market rate at the time of purchase. A bond bought at a discount and held to maturity is redeemed at par. If the bond is carried at cost until the period of redemption, that period would secure the credit for the difference between cost and par. Similarly for a bond bought at a premium, and carried at cost constantly, the period of redemption would bear the loss between cost and

redemption price.

Nature of Bond Discount or Premium

To bring out more clearly the real nature of bond discount or premium, under the limitation stated above, consider a bond selling at 90 and bearing 4½% interest. This should be interpreted to mean that the issuing company, because of the low rate offered on the bond, will have to pay at maturity $1,000 for every $900 now received. It is, as it were, having to prepay $100 interest on every bond sold, in addition to its promise to pay the stipulated bond rate of interest periodically. It is selling a $1,000 security for $900 and is thus depriving itself of $100 which it might have had by contracting to pay the present market rate of interest. From the other (i.e., investor's) point of view, he is willing to lend money at the bond rate only because he expects to be compensated by the $100 to be received in a lump sum at the maturity of the bond.

The wisdom of fixing the bond interest rate so that the bond will command either a premium or a discount hinges upon the soundness of the forecast as to the money market in the future. It is, of course, a speculative transaction. Since, then, discount on bonds is, from the standpoint of the issuing concern, a prepayment of a portion of the interest in amount sufficient to make the income rate on the bond correspond with the rates prevailing in the market, this prepayment is applicable to the whole period of the life of the bonds and should be spread equitably over that period. To accomplish this it is necessary, every time bond interest is paid, to transfer to the Bond Interest account a portion of the Discount on Bonds account, thus gradually wiping off the Discount account and making the Interest account show every period the real amount (and real rate) of interest as distinguished from the amount paid as indicated by the bond rate.

In the present discussion, the chief concern with the problem of bond discount and premium is from the point of view of the investor. Having established from the other point of view the true relation between premium and discount and bond interest, there will be considered the two additional problems as to the manner of carrying the record on the investor's books and as to the method of valuing the investment at each balance sheet period. First, then, is the problem of making the record.

Record of Bond Investments

When bonds are purchased the record may be made in two ways. Accounts may be kept with the bonds at par, separate valuation accounts being carried for the discount or premium. An account with bond interest is also opened and sometimes one with prepaid interest on bonds, where, as is usually the case, the bonds are bought with accrued interest to date of purchase. The accrued interest, however, is more conveniently recorded as a charge in the bond interest account, thus automatically adjusting the income from the bonds when the first coupon after date of purchase is redeemed. As stated in Chapter XIV, the amount of the discount or premium is to be spread equitably over the life of the bond. The method of making an equitable distribution is a problem to which consideration will be given in later pages of this chapter. The entry to effect the distribution is a transfer entry between the premium or discount account and the bond interest account for the portion accrued as on the date of each payment on the coupons. The result of the transfer is to establish with the bond account at par a true valuation of the bonds held as on that date, and to secure the correct amount of income from bond interest to be credited to the current period.

The second method of making record of the bond investments is to record the purchases at cost in the bond account, carrying there full information as to premium or discount, no separate accounts with these being opened. When the bond interest falls due, the bond account itself is written up or down for the amount of the discount or premium accrued during the current period. The contra entry is in the bond interest account just as above. This latter method does not commend itself when the only record kept of bonds is that mentioned above. If the investments are so numerous as to require a subsidiary ledger for their record, where with each kind of bond accounts will be kept with its par, discount or premium, and interest, there is no objection to handling the controlling account on the general ledger by making the discount or premium adjustment directly to the bond account. Fuller information is given and the record is less involved, however, when handled by the first method.

Amortization of Bond Discount and Premium

The equitable distribution (technically known as "amortization") of the discount and premium on bond investments is the essence of the problem of their valuation. There are two methods of making this distribution, termed the "straight line" and the "scientific" method. Under the straight line method the amount of the discount or premium is divided by the interest periods the bond has yet to run, and the quotient is made the amount of periodic amortization. Although not scientifically accurate, the method commends itself because of its simplicity and consequent ease of operation. Its use is allowed by the Department of Banking of the State of New

York for valuing the investments of savings banks. The scientific method is based upon compound interest calculations and will be best understood by means of examples. Under this method the discount or premium is looked upon as the amount of an annuity. The portion which must be written off for any period is the present worth of the annuity on that date, taking into consideration the rate of interest and the time in interest periods the bond has still to run.

In practice, however, the amount of amortization is not found in that way. To find the periodic amortization, it is necessary to know the cost of the bond, its coupon interest rate, and the effective rate. By effective rate is meant the real income rate on the basis of the price paid for the bond. Assume that a 3% bond, interest payable January and July, has 3 years (6 periods) to run and is bought for $971.99 so as to yield 4% on the investment. At the end of the first semiannual period the actual interest received will be $15, but the real income on the investment is $19.44 because it was purchased on a 4% basis for $971.99 (2% on $971.99). Of the total discount of $28.01, $4.44 (19.44-15.00) is to be credited to the current period. The adjustment of discount brings about a new valuation of the bond, it being now worth $976.43 (971.99 + 4.44), because nearer by six months to maturity when it will be worth par or $1,000. So, for the next period the coupon is $15 and the effective income, $19.53 (2% on $976.43), hence the amortization is $4.53; and so on for the six periods, at the end of which the discount will have been completely distributed, i.e., amortized.

The following schedule shows the periodic amortization and new values of the bond:

3% bond, par $1,000; bought on a 4% basis for $971.99; 3 years to run; interest January and July. ============+========+=========+============+========+========= | | | | Discount |Nominal|Effective| Periodic |Value of| Adjusted Date |Income | Income |Amortization| Bond | Amounts ------------+-------+---------+------------+--------+--------- Jan. 1, 1915|$..... | $..... | $..... | $971.99| $28.01 July 1, 1915| 15.00 | 19.44 | 4.44 | 976.43| 23.57 Jan. 1, 1916| 15.00 | 19.53 | 4.53 | 980.96| 19.04 July 1, 1916| 15.00 | 19.62 | 4.62 | 985.58| 14.42 Jan. 1, 1917| 15.00 | 19.71 | 4.71 | 990.29| 9.71 July 1, 1917| 15.00 | 19.81 | 4.81 | 995.10| 4.90 Jan. 1, 1918| 15.00 | 19.90 | 4.90 |1,000.00| ..... +------------+ | Total discount amortized $28.01 | | ----------+--------+---------

A similar schedule for a bond bought at a premium immediately follows:

5% bond, par $1,000; bought on a 4% basis for $1,028.01; 3 years to run; interest May and November. ============+========+=========+============+=========+========= | | | | Premium |Nominal|Effective| Periodic |Value of | Adjusted Date |Income | Income |Amortization| Bond | Amounts ------------+-------+---------+------------+---------+--------- May 1, 1917|$..... | $..... | $..... |$1,028.01| $28.01 Nov. 1, 1917| 25.00 | 20.56 | 4.44 | 1,023.57| 23.57 May 1, 1918| 25.00 | 20.47 | 4.53 | 1,019.04| 19.04 Nov. 1, 1918| 25.00 | 20.38 | 4.62 | 1,014.42| 14.42 May 1, 1919| 25.00 | 20.29 | 4.71 | 1,009.71| 9.71 Nov. 1, 1919| 25.00 | 20.19 | 4.81 | 1,004.90| 4.90 May 1, 1920| 25.00 | 20.10 | 4.90 | 1,000.00| ..... +------------+ | Total premium amortized $28.01 | | ----------+---------+---------

The problem of amortization is thus seen to be comparatively simple when the cost of the bond, its nominal rate, and effective rate are known, and successive valuations of the bond are equally simple. The crux of the whole calculation is thus seen to be the determination of the original purchase price of the bond. At the time of the purchase of the bond the following facts are known: the par of the bond, the time it has to run, its rate of interest, and the rate of earning desired on the investment. There are three methods or formulas by which this price can be determined and they will be explained in turn. However, the development of the formulas will be more easily understood if some points in compound interest and annuity calculations applicable to the three methods of valuing the bond are first explained.

Formulas for Compound Interest

In the determination of the present worth of a sum of money at compound interest due a certain number of years hence, the following symbols will be used:

A = the sum which placed at interest at the given rate will accumulate to the given amount in the given time. B = the given amount accumulated r = given rate of interest per _period_ R = 1 + r n = the given number of periods

The present worth of B is manifestly A, the sum which, when placed at interest, amounts to B. At compound interest the amount to which A will accumulate in n periods is given by the formula:

(1) B = A(1 + r)(1 + r) ... to n factors, which reduces to

= AR■, whence solving the equation for A

B B (2) A = ----, i.e., the present worth = ---- . R■ R■ 1 From this, the present worth of $1 is seen to be ---- . R■

Formulas for Annuities

An annuity is a given sum of money placed at interest usually at the end of each successive year or period, and allowed to accumulate at compound interest for a number of periods. For bond valuations it is necessary to know the amount of an annuity and the present worth of this amount. The following terminology will be used in the solution of the problem:

A = the sum put at interest periodically B = the amount to which A accumulates r = the rate of interest per period R = 1 + r n = the number of periods P. W. = the present worth of the annuity

The first sum, A, placed at interest at the end of the first period will accumulate for n-1 periods and, according to formula (1) above, will amount to AR■■¹. The second sum, A, placed at interest at the end of the second period will amount to AR■■²; etc. The last sum, A, will not accumulate and so is worth just A.

The amount of the annuity is thus seen to be the sum of the amounts of the several periodic sums. Expressed as a formula:

B = AR■■¹ + AR■■² ... + AR + A

= A(R■■¹ + R■■² ... + R + 1), whence

R■■¹ R■■¹ (3) B = A------ or A----- R - 1 r

The expression in parentheses is a geometric series whose sum may be written in the fractional form shown.

The present worth of B, i.e., of

R■■¹ A-----, r is found from formula (2) above to be:

R■■¹ A----- divided by R■. r

Expressed as a formula:

R■■¹ (4) P. W. = A----- R■r

Formulas for Bond Valuation

The method of valuing a bond makes use of the formulas (1) to (4) just established. The symbols used in the bond formulas will be:

P = the par or face value of the bond r = the effective rate c = the nominal rate—the rate specified in the bond C = Pc, i.e., the value or amount of a matured interest coupon, the nominal yield of the bond Pr = the interest yield on par at the effective rate V = present worth or value of the bond

First Method. The present value of a bond may be looked upon as the sum of two present worths, viz.: the present worth of the face of the bond and the present worth of the annuity represented by the periodic interest payments, i.e., the coupons. The present worth of the face is, according to formula (2), P/R■. The present worth of the coupon annuity is, from formula (4), seen to be

R■■¹ C-----. R■r

Hence the present value of the bond is the sum of these two present worths, i.e.:

P C(R■■¹) Pr + C(R■■¹) (5) V = --- + --------- or ---------- R■ R■r rR■

Second Method. Here, the determination of the amount of premium or discount which is fair payment for a bond is the point of attack. That is, using par as a basis, how much above or below par is the bond worth? The fair premium is based upon the difference between the nominal yield of the bond and the interest return in the present money market. Stated otherwise, in the case of a bond selling at a premium, the nominal interest return may be looked upon as composed of two parts, viz.: (1) a portion representing interest at the _effective_, i.e., current money market rate on the par value of the bond, and (2) a portion—the difference between the nominal yield and (1)—which is of the nature of an annuity for the life of the bond. The present worth of this annuity is the fair premium on the bond.

To illustrate: A 6% bond sold in a 5% market would have a nominal yield annually of $60. All that can be secured, however, on the par value is $50. Hence, on the basis of valuation at par there is a $10 excess of nominal over market yield which would be received every period. The present worth of this $10 annuity is the fair premium which the bond will command. With the use of the previous symbols, this annuity is expressed by the quantity (C-Pr) whose present worth, as determined by formula (4) is

(C - Pr)(R■ -1) ---------- . rR■

Therefore, the value of the bond is the face or par of the bond plus the present worth of this annuity, i.e.:

(C - Pr)(R■ - 1) (6) V = P + ---------- rR■

This formula when simplified reduces to

Pr + C(R■ - 1) ----------, rR■

which is identical with formula (5) and, of course, values the bond at the same amount.

Third Method. Valuation by either of the methods above is rather complex, requiring for easy solution the use of logarithm or compound interest tables. A third method, requiring only the ordinary arithmetic processes is sometimes used, although very burdensome when the periods are numerous. This is sometimes called the periodic method because working backwards from par, the value at the next preceding period is determined, and from that the next is found, and so on till the value at the desired period is reached. Reference to the second amortization schedule shown on page 270 will help in understanding the process. Using the same terminology as above and this additional:

P■ = the first preceding value above par ($1,004.90 in the schedule) P■ = the second preceding value above par ($1,009.71 in the schedule) Etc.

formulas 7 to 9 below may be developed.

It was noted that any particular value of the bond is found by subtracting from the next preceding value the difference between the nominal and effective incomes. The nominal income is always based on par, and the effective on the value at the last interest period. For example, in the schedule referred to: $1,004.90-($25-$20.10) = $1,000, the $20.10 being the effective income, 2% on $1,004.90. Using symbols the above equation may be generalized as follows:

P + Pc (7) P■ - (Pc - P■r) = P, whence P■ = -------, and 1 + r

P■ + Pc (8) P■ - (Pc - P■r) = P■, whence P■ = --------, and generalized, 1 + r

P■■■ + Pc (9) P■ - (Pc - P■r) = P■■■, whence P■ = -------- 1 + r

This gives a working rule whereby it is possible to work back from the known value, par, by successive operations until any desired value is found. The calculation is somewhat as follows for the example used in the schedule:

1,000 + (1,000 × .025) 1,025 ---------- = ------ = 1,004.90 1.02 1.02

1,004.90 + (1,000 × .025) 1,029.90 ---------- = -------- = 1,009.71 1.02 1.02

Similar calculations will develop the other values in the schedule. In the case of a bond with, say, 30 periods still to run, the burdensome nature of the calculation by this method is apparent.

While commercial houses rarely need to use the algebraic formulas for calculating bond values, it is the only really correct method of valuing bonds which are held for long-time investment, and the accountant should be conversant with it. For the balance sheets of savings banks, insurance companies, and other investment concerns, scientific valuation of bonds with the attendant amortization up and down of discounts and premiums is not only theoretically correct but practical considerations, in a market such as prevails in a time of marked but temporary depression, demand that it, or some approximation to it, be used.

A discussion of the valuation of serial and short terminal bonds, or those carrying more than one rate of interest, or those redeemable by lot at various times, is beyond the scope of the present work.

Valuation of Sinking Funds

The section of the balance sheet under consideration usually includes the various funds representing the investment of reserves. Sinking funds, building funds, insurance, pension, endowment funds, and the like, are examples of this class of asset. The use of the term fund should be strictly limited to specific assets set aside for specific purposes. The problem of valuation in connection with funds will be considered under two sets of conditions, viz., when the funds are invested in a concern's own securities and when invested in outside securities. The practical questions in connection with funds are those of finance rather than of accounting.

The determination of a policy of investment as between the concern's own and outside securities depends on many considerations, some of which do not come strictly in the purview of the accountant. It is argued that for the sake of immediate availability, investment of funds to be used for a specific purpose at a definite time should be in the securities of other concerns over whom control does not extend. In some cases, however, provision is made in the trust deed of a sinking fund to the effect that the funds set aside shall be used to purchase the bonds to retire which the funds have been created. These bonds may be canceled or held for the sake of their income in the fund till maturity. There would seem to be no choice between a concern's own and outside securities, provided the same standards of moral obligation are observed in both cases. If the securities purchased for the funds are the concern's own bonds, they should as a rule be valued at cost and the premium or discount amortized over the remaining life of the security. They may, of course, be carried on the books at par and the premium charged immediately against any income in the fund. The showing on the balance sheet should be in exact accord with the facts. If the bonds have been purchased and canceled together with their coupons, the amount of such cancellations should be shown as a deduction from the bond liability. The fund is thus serving its purpose _currently_ by reducing that liability. Any uninvested balance in the fund should, of course, be shown among the assets. When the bonds are purchased and held uncanceled for the sake of their income, it is probably better to carry them among the assets, indicating, if the information should be considered vital, that the securities in the fund are the concern's own securities.

If the funds are invested in outside securities, these should be valued on the basis of long-time investments. If bonds, their premiums or discounts should be amortized. If, however, the credit of the issuing concern is such as to cast doubt on its ability to redeem them at maturity, other bases for valuation should be taken. It might even be necessary to set up special reserves to replenish the expected shrinkage upon realization of the securities held in the fund. A final injunction may not be out of place, to the effect that all funds should be definitely labeled so as to show their purpose.

Valuation of Investments in Land

Investments of a more or less permanent nature sometimes take the form of investments in land. This may be for the purpose of securing an income; it may be of a speculative nature, as when land is held for appreciation in value; it may be to secure room for future expansion; or it may be for the purpose of preventing a competitor from securing favorable holdings as to trade location or facilities. For whatever purpose acquired, as here considered, the land is a permanent investment and should be separated in the records from land held for operating purposes. The manner of accounting for these investment holdings is somewhat dependent on the purpose for which they are held. In most cases, particularly if the land is income-producing, at least a land expense and income account will be needed in addition to the asset account or accounts with the land.

As to the valuation of these holdings, full cost with no account taken of depreciation or appreciation in value is the correct basis. As stated in Chapter XVII, page 307, under certain conditions the carrying charges on non-income-producing lands may be added to the value of the holdings. If lands are held over a long period to secure appreciation in value, certainly all carrying costs should be loaded on to the asset account, offset, as shown in Chapter XVII, by a suitable reserve. Care must always be taken not to secure inflated values by these methods. If any of these holdings are disposed of, the profit or loss then actually realized must be taken into account; but no unrealized profit or loss should be brought onto the books—except, perhaps, as a balance sheet footnote.

CHAPTER XVI

MACHINERY AND TOOLS, FURNITURE AND FIXTURES, AND OTHER EQUIPMENT

General Considerations

The valuation of assets grouped under the head of equipment presents nothing new in principle but requires consideration of many points in the application of principles and of some features in accounting. Here the principle of value as a going concern is particularly effective. As in the valuation of prepaid expenses on a going concern basis, so here forced sale or liquidation value has

no place. The business is viewed as established and as expecting to operate continuously. Capital has become tied up in certain equipment essential to the undertaking, in the sense that to dispose of it in its entirety would mean a break-up of the business. It cannot therefore be freed or put to other uses without a reconstruction of the present enterprise. Accordingly, the possible market value, as second-hand property, should not in any way influence the valuation at which this group of assets is carried on the books. Only full cost at the time of installation and depreciation, using the term in its broad sense, need be considered in the problem of valuation.

Distinction between Personalty and Real Property

The present chapter deals with such fixed asset equipment as machinery and tools, furniture and fixtures, delivery equipments, patterns, lasts, dies, maps, drawings, electrotypes, ovens, furnaces, etc., as distinguished from the more fixed group of lands, buildings, leaseholds, and the like. In the main, the point of differentiation is the legal one of personalty and real property, although the intricacies of the law on this vexed subject are never, so far as is known, reflected in the books of account, nor is it the purpose here to attempt to lay down any working rules or standards by which such differentiation can be made. There seem to be none except certain broad generalizations, each case resting on its own peculiar surroundings. Circumstances, however, may arise under which a clear-cut distinction is desirable. A bond issue supported by a mortgage on real property or on personal property _may_ depend, although not usually, on such a distinction for a large share of its security. The margin of safety may hinge on this point. It may be desirable to be able to trace on the face of a balance sheet the particular property covered by a mortgage. And should foreclosure of the mortgage become necessary, it is, of course, essential to know exactly the property subject to the lien. These are not points under contemplation in a going concern, although the possibility of their arising should not be lost to view. Here the problem of valuation and accounting for such valuation is viewed from the standpoint of a going concern and not one facing partial or total liquidation. Furthermore, as stated above, the point is, in its final analysis, one of law and not of accounting.

It is not intended by the foregoing statement to sanction any method of keeping the records in non-accord with fundamental rulings of the law, but only to state that, so long as substantial agreement is secured, accounting has served its intended purpose. Wherever any specific property is known to be subject to a lien, it is of value to the management for the accounts to reflect the fact. There may, however, be circumstances under which it is not desirable that the _accounting_ records give this information. Conditions must govern each particular case without prejudice, and the principle holds that so long as substantial accuracy is reflected in the accounts as to this point nothing more is necessary.

Machinery and Tools

Under this head will be included not only the assets carried under that ledger caption, but also power machinery, power transmission, shafting, connections, electric transmission cables, and the like. The term is used in a very broad sense. While all these items are subject to one general rule of valuation, usually each must be separately considered to determine the practical application of the rule. The valuation involves, of course, the factor of depreciation, and it is readily apparent that not only do different pieces of machinery differ in this respect, but the same machines in different factories will vary as to this element and even in the same factory two similar machines will not usually be affected in the same way. This may be caused by defects or differences in quality, almost invariably latent, inhering in the machine and also by the different conditions under which they are operated. As pointed out in Chapter VI on depreciation, many of these are engineering problems which the accountant alone cannot solve but the existence of which he should know. Manifestly, all that can be attempted here is to point out their existence.

Accounting Records

The valuation of machinery and tools as here contemplated is dependent largely on the accounting records. Therefore, it is desirable to keep separate records for each of the two classes. This is so because of the greater degree of fixity of the one over the other. As to tools a distinction is also made between machine tools and general shop or hand tools. Machine tools are those with which the machine does its work. Thus, cutting tools for use with any particular machine, auxiliary equipment used for some operations, but not for others, and the like, constitute a very essential and component part of the machine and should be recorded and valued with the machine even though the tools need to be replaced much more frequently than the machine. On the other hand, shop tools comprise those of general utility which are largely used by hand. Hammers, wrenches, hand shears, pliers, chisels, bits, and the like, are examples of shop or hand tools.

Where the number of machines is large, proper accounting requires a subsidiary record known as a machinery ledger or register controlled by the machinery account on the general ledger. In this subsidiary record accounts should be kept with each class of machines, and with each machine separately if the record as to the performance of any specific machine furnishes essential information.

Operation of Machine Accounts

Every machine should be charged with its full cost. Full cost is understood to include invoice price, insurance during transit, freight, duty, and drayage charges, and installation costs. The last item usually includes the platform or stand on which the machine is erected, with all costs in connection therewith, when special supports or platforms in addition to the regular factory floor are needed. The cost of attaching the machine to the power and meters for measuring its power consumption are not usually included therein, these being classed as costs of power equipment—although practice is not entirely uniform in this regard. The machine record should also show the name of its manufacturer and its order number and any other useful information such as terms and period of guarantee, estimated life, rate of depreciation to be applied, numbers and kinds of tool equipment, etc. All deductions from the value of the machine must be on the same basis of full cost. Such deductions might arise because of fire, sale, or replacement. The proper handling of the account when deductions are necessary will be explained at the close of the chapter, as the method is applicable to all classes of asset equipment.

Valuations of Machinery and Tools

The statement of the principle of valuation for machinery is simple, but the application of the rule is complex. The valuation formula for machinery is cost less depreciation. As stated above, the condition of the market has no influence on the going concern valuation of fixed assets. If the market is now lower than at the date of purchase, this simply means that more capital was then required to start operations than is now required. If the forces of competition are free to act, the margin of profit or the margin of return on the investment in machinery will be somewhat less in the one case than in the other. If the market is now higher, then the situation is in favor of the earlier investment rather than the present one. In neither case should costs of production be falsified by valuing the machinery and other equipment at any other figure than cost.

Estimate of Depreciation

Estimating the depreciation on machines is the chief and vital problem in their valuation, because depreciation is reflected in the cost of the article manufactured, being a cost of production just as truly as the raw material used. As brought out fully in Chapter V, page 93, the so-called depreciating assets are really of the nature of deferred charges to operation and a depreciation estimate is the amount of the periodic charge against production. Because of the speculative nature of an investment in machinery (neither the quality of the machine being exactly determinable nor the conditions of its operation known), its depreciation is always an estimate. For this reason it should be based on the best possible knowledge available at the time of installation.

Any estimate so made must be the subject of periodic revision. How frequently this revision should be made will depend both on the length of estimated life and the way in which actual experience compares with the expected or estimated conditions. The experience on which the estimate is based should, of course, be with the same or similar machines, gained, if possible, amid the same surroundings and conditions under which the new machine will operate. In default of such experience or as a valuable check thereon, the results of others in the use of the machine and the expert advice of those who have studied the problem of depreciation in its practical applications should all contribute to the making of this estimate.

History of Machine

This need of experience data creates the necessity of a means for gathering and preserving the data, and the machinery record above referred to serves the purpose. Therein should be set forth the complete life history of the machine—not only the original cost and the additional data given above, but also the time and cost of all replacements and all information relevant thereto and, as a memorandum, the cost of maintenance, repairs, up-keep, etc. The record is not complete without the data as to repairs. A periodic statement should also be made as to any abnormal conditions under which the machine has been operated, such as overtime, overload capacity, etc. Where possible, the output of the machine in units of product should be included in the record. Where a group or battery of similar machines is operated, the average experience of all of them is the best possible data on which to base future estimates of depreciation.

The more life histories available, the more reliable will be the average obtained therefrom. After making due allowance for changed conditions of operation, this average should prove a reliable forecast of future experience. After all, an estimate of depreciation is in many respects very like an insurance charge, and the time may come when the life histories of a sufficiently large number of machines will provide a very reliable basis for estimate at any given time of the expected life of a machine when operating conditions are known.

Standards of Operation

One phase of the modern efficiency movement relates to the study of machine operation. This has helped in the study of depreciation, in that standardized methods of use have been established. These comprise a standard speed of operation, proper periods of rest, correct methods of throwing in the power, the proper adjustment of parts for each machine; and for each kind of machine tool, the proper degree of hardness to which the cutting edge must be tempered, the speed of cutting, and the number of operations before resharpening—all these standards have been established, resulting in an average performance of maximum efficiency which may be called the normal operating conditions of the machine. Where such studies have been made and where the set standards are uniformly observed, a very reliable basis is furnished for forecasting the future. To insure the observance of these standards a permanent card should be attached to every machine, giving all the information essential to standardized operation. A copy of this standard should be made a part of the record in the machine ledger.

Abnormal Operation

To make the periodic revision of the estimate of depreciation accord with the fact or rather with the best possible estimate of the fact, any abnormal operation of the machine should be considered. Thus, if the machine has been worked overtime, say on a three-shift day instead of one-shift, or if it has been crowded beyond its capacity, if repairs have not been made when they were needed, if the wage policy has been changed from a per diem or per hour basis to a piece-work basis—all these points must be considered.

Machines which are seldom used require careful consideration. It is oftentimes necessary to include in the equipment special machines for infrequent operations and processes. The normal operation of such must be estimated for each particular factory and depreciation based on such use.

All of the foregoing points must be taken into account in connection with the operation of both machines and power equipment. In the case of the power machinery, a consideration of kind and quantity of fuel, manner of feeding and cleaning, quality of the boiler water, etc., with the set standards, forms the basis for a revision of depreciation rates and estimates.

Map of Machine Location

In connection with the machinery record, a complete map showing location and number of every machine is especially desirable. In case of fire it makes identification easy.

Methods of Application of Depreciation

In the application of depreciation, three methods are used more generally than any others. The straight line method, as discussed in Chapter IX, is the one most widely employed. It is to be preferred to all others, giving satisfactory results and being easy of application. The fixed rate of diminishing value method also has many adherents, and depreciation based on the number of units of product turned out is a third method often used where applicable—though applicable in a very limited degree.

Under the straight line method, it may be ventured as an opinion that 10% is a fair average minimum rate and 15% to 20% an average maximum. The knowledge as to what constitutes an average rate serves little useful purpose, however, although it does give a rough estimate when spread over a large variety of machines. It has been said that from a mechanical point of view no machine can depreciate _actually_ more than 30% and be operated efficiently. This does not, of course, mean that the depreciation reserve should never show more than a 30% offset to the value of the machine, as this would indicate too high a rate were the machine still in operation. It does mean that, according to a theoretical standard of operating efficiency, any machine which cannot fulfill at least a 70% efficiency test should no longer be used. It should be remembered that the depreciation reserve is a device for financing depreciation and nothing else.

Basis of Valuation

The basis, therefore, for the valuation of machinery is its full cost less estimated depreciation. Such an appraisal is subject to periodic revision by comparing the estimated with actual depreciation as more of the facts brought out by the period of life already expired become available. Perhaps the method of inventory, as will be explained in connection with hand tools, is best applicable to machine tools and even to certain small bench machines on the boundary line between tools and machines. However, special tools made for a particular purpose and perhaps not adapted to any other use should be charged against the job and not carried as an asset.

Scrap Material

A financial consideration in connection with machinery is the disposal of scrap material. This should be disposed of as advantageously as possible. It should be held until the market for old metals is high, if at the time of its discard prices are abnormally low.

Accounting for Tools

With regard to the method of accounting for hand and shop tools and the basis for valuing them, the additional factor of possibility of loss claims consideration. Unlike machines, which are for the most part securely attached to the premises, tools are loose, they may be carried off or lost, and so not only loss in value due to depreciation but loss from theft or carelessness must be taken account of. Unless an adequate control is established over the physical handling of loose tools, a very considerable _leak_ may result at this point.

In accounting for tools, different practices are encountered. Thus, the Public Service Commission for the First District of the State of New York, in its Uniform System of Accounts for Gas Corporations, authorized that, “hand and other small portable tools liable to be lost or stolen shall, when first acquired and before issued for use, be carried in a suitable Materials and Supplies account; when issued, they shall be charged to the appropriate expense account. Portable tools and apparatus of special value may, however, be charged to the appropriate tangible capital account, and remain therein so long as record is kept of the persons to whom such tools and apparatus are issued and such persons are made responsible therefor.”

Sometimes the practice is found of charging all purchases of tools to an asset account for a short period of, say, two or three years, and thereafter to a suitable expense account, with a periodic revision based on an inventory about once in five or six years. Again, the Loose Tools account may be handled just as any other asset account, i.e., charged with all purchases, credited with losses, and depreciation provided for. The manner of handling the record is not vital, any method sufficing that fits particular needs. All methods must, however, take cognizance of the fundamental distinction between capital and revenue charges and provide some means by which the Loose Tools account, as an asset account, shall represent substantially correct asset values. A successful method of securing control over the physical handling of tools, where the plant is large enough to justify it, is to place all tools when purchased in the care of a stores-keeper and issue them only on authorized requisition, thus securing an accurate record of them.

Depreciation on Hand Tools

As to the valuation of hand tools, depreciation is often left out of account on the theory that, so long as a tool can be used to perform the service expected of it, it is worth approximately what it cost. Where as an adjunct to this method of valuation, a physical inventory of tools is taken periodically and all losses so shown are charged to expense, substantially correct asset values are secured. Of course, _theoretically_, tools are as much subject to depreciation as other similar assets, but the method of the inventory valued at cost, and therefore disregarding depreciation, is perhaps the best practical way of handling the valuation of tools, and it gives sufficiently satisfactory results for most purposes.

Valuation of Home-Made Machinery and Tools

Machinery and tools made in own factory offer a problem in valuation. It may be stated thus: Shall such be valued at the market price at the time when made, or shall valuation be the cost to manufacture? It is argued that had the machinery been purchased on the market, as is usually the case, the cost would have been market price; the machinery is worth that price and should be so valued. If the cost to make is less than the market, to bring the machine on the books at market would necessitate the taking of a profit of the difference between cost and market. No profit has been made, only a saving in capital investment. This confusion between profit and savings is referred to in Chapter XIII.

In the long run, i.e., in the period covered by the life of the machine, it makes no difference in profits for that period whether the machine is carried at cost to make or at market, because its value is written off to depreciation during its life and the higher value means an increased depreciation charge. This will exactly offset during the period of the life of the machine the profit taken by bringing it onto the books in the beginning at market instead of cost. As a matter of principle, however, the point involved is of sufficient importance not to justify the practice. By cost to make is meant full cost, which includes materials used, labor applied, and a fair share of the overhead expenses. Whatever the cost to make, whether lower or higher than the identical equipment could be purchased for on the market, that represents the capital outlay and is the true basis for valuation, taking cognizance of depreciation for the elapsed period.

Expenditure for Rearrangement of Machinery

In connection with expenditures made in the rearrangement of machinery within the plant for various purposes, the question of the effect of it on the value at which the machinery is being carried requires some consideration. In Chapter V where an attempt was made to mark out broad boundary lines for capital and revenue expenditures, it was stated that any expenditure which produces greater earning capacity or without which a lessened earning capacity would result (assuming that all normal expenditures for maintenance and repairs are being made concurrently), may be treated as a capital expenditure or at least as a deferred charge to be spread over several periods.

In the case of depreciating assets, the practical identity of the two methods is apparent. Thus, if the expenditures for rearrangement of the machinery have either of the effects mentioned above, there is no serious objection on theoretical grounds to capitalizing them. Instead, however, of injecting such intangible values into the machinery account, it is far better, because more exact and accurate, to show them separately. Practical considerations demand that such expenditures shall not usually influence the valuation of machinery and a conservatism born of the fear of inflation requires that when treated as deferred charges, they should be written off as quickly as may be done without undue burden on the periods' profits.

Definition of Furniture and Fixtures

Furniture and fixtures, as an asset title, is not clearly defined. It may include the usual tables, desks, filing cabinets, bookcases, typewriters and other mechanical equipment, safes, chairs, counters, and in addition, light, heat, and plumbing fixtures, show windows, partitioning, shelving, and the like. The account should be charged originally with all such items at full cost. Great care must be exercised in handling repairs and betterments to avoid an inflation of values. The distinction between capital and revenue expenditures as regards all such assets already acquired is usually so slight and uncertain as to justify the establishment of a policy of charging all these to expense. Otherwise, the ease of inflation is apparent. All new purchases should be charged at full cost to the asset.

Valuation of Furniture and Fixtures

The basis for the valuation of furniture and fixtures is at cost less depreciation. In applying depreciation, account should always be taken of the usually very small residual values in this class of asset. Scrap value in some cases is only as kindling wood and therefore almost or entirely negligible. In some cases of easily movable equipment, the method of the inventory as used for loose tools will give better results in valuation than an appraisal method based on cost less depreciation. One often finds the conservative practice of bringing onto the books a rapid depreciation to scrap value during the first few years, at which nominal value the asset is carried thereafter. This is a common practice in financial institutions. While not theoretically justifiable, in comparison with the opposite tendency based on too great optimism as to the life of the asset, the practice is to be commended.

The average range for depreciation of this class of asset is from 10% to 20%, estimated by the straight line method. Where premises are leased and any equipment of this kind is, according to the terms of the lease, to remain with the building, it is necessary that a depreciation rate be taken high enough to accomplish complete writing off by the end of the lease. This rule also applies if the equipment may be removed but would be in a badly damaged condition, resulting in little remaining value.

Delivery Equipment—Definition and Valuation

Delivery equipment includes all property, direct or auxiliary, used in connection with the delivery of goods both inward and outward. Horses, wagons, and harnesses, motor trucks and cars, repair parts, and repair equipment, containers, holders, and the like, are common examples of this class of asset. In the main, these assets are handled very much as all the others of the general

equipment group. Valuation is on the basis of cost less depreciation for the most part, but in many instances the method of the inventory should be applied.

If horses comprise a part of the equipment, not only must depreciation due to wear and tear be reckoned, but accidental causes such as death and disablement must be given consideration. Experience in each business based on the particular kind of work to be performed and the conditions under which it is being performed furnishes the only adequate basis for estimating the depreciation rate. Thus, heavy or light draughting, speed to be maintained, kind of road on which the haul is made—cobble stones, brick, asphalt, wood blocks, or dirt—and the standard of appearance to be maintained—all these affect not only the cost of up-keep but also the rate of deterioration. Sometimes it may be safe, as with loose tools, to charge all purchases to capital for the first few years until the equipment is complete, and thereafter all renewals to revenue, depreciating the asset account, say, 20%, and maintaining it at that figure. Any marked increase or decrease in numbers would require respectively an added capital charge or a reduction of the original charge. Whether this method or the method of the inventory be used for valuation purposes, there should be a periodic appraisal by an expert horse dealer and adjustment of values based on this appraisal.

Wagons, trucks, and motor vehicles should be numbered and all accounted for periodically by physical inventory. It may be desirable in some cases to maintain a register for these, wherein the performance of each can be recorded and so compared. This is particularly desirable when a change of delivery policy is under contemplation and comparative records are needed of the performance of various types of vehicles. This class of delivery equipment is best valued on the basis of cost less adequate depreciation, with the periodic inventory as a check on numbers and condition.

Carriers and Containers—Valuation

The most difficult of all the items of delivery equipment to handle and value is that class represented by carriers and containers. These may be barrels, kegs, casks, bottles, baskets, and boxes, and are met in the brewery, dairy, bakery, laundry, and oil businesses. In some lines it is feasible and is the practice to charge the customer with the fair cost of the carrier, giving a return privilege with refund, dependent upon the condition of the returned carrier. This is good where applicable, although it necessitates having an adequate redemption fund which may be operated somewhat as a bank's reserve is, i.e., only large enough for normal needs but capable of ready enlargement when the need arises. In other lines of business such a method of handling the container cannot be used. Here, as in the bottled milk trade, only experience will give a proper basis for estimating the depreciation through loss, theft, and breakage. The rate is almost invariably high, and liberal depreciation should be provided for. Taken all in all, throughout the various kinds of delivery equipment rates ranging from 16■% to 25% constitute fair average rates.

Patterns, Molds, etc.—Valuation

The last kind of equipment items requiring consideration is comprised of such items as patterns, lasts, molds, dies, drawings, electrotypes, wood cuts, forms, models, and the like. Wherever possible, these should be charged to the particular job for which they were made and not carried as assets. Unless there is a probability that the pattern, mold, etc., will serve for other uses than those for which it was made, the costs of making should be borne by the job on which it was used. This is very often not the case, however, and these items can be used for successive production. This is particularly true of a standardized product which is not apt to be much affected by change in style or the whims of a purchasing public. At the best, however, they constitute a treacherous and highly speculative asset and require careful handling to avoid inflation of value. Thus, it is easy in the publishing business to allow electrotypes, wood cuts, etc., to assume unwieldy proportions to the other assets. In manufactories of wearing apparel, the fickleness of fashions requires that patterns, lasts, and models be written down ruthlessly to the lowest possible figure. Here obsolescence is a big factor.

Under the limitations set, valuation should be based on cost with a very liberal periodic depreciation. The rate will _average_ anywhere from 20% to 50%, though a lower rate may sometimes be proper.

Disposal of Assets

In connection with the handling of the asset and its valuation account, the disposal of all or some portion of the asset requires consideration. It is a fundamental principle that whatever is taken out of the asset account must be taken at the same cost as it was introduced into the record. Thus, an asset recorded at cost of $5,000 and sold for $4,500 would be shown as taken out of its account at $5,000, the apparent loss of $500 being recorded in a suitable expense account. If the asset has suffered depreciation between the date of purchase and sale, and the depreciation reserve shows this, that must be taken into account. Practically, it is

best handled by transferring to the asset account from the depreciation reserve the part of the reserve applicable to the portion of the asset disposed of. Upon disposal there is an additional credit to the asset account of the difference between cost and the depreciation to date, i.e., the amount of this credit is the present appraised value of the asset sold, taking into account not only the recorded depreciation but the accrued as well. This brings out the true as distinguished from the apparent profit and leaves in the reserve only that portion which is applicable to the asset remaining.

An illustration will show the process of handling. Assume that the $5,000 asset is a portion of a $50,000 machinery account, for which the recorded depreciation reserve is $10,000 and the depreciation on the portion sold accrued to the date of sale is $200. The entries, necessary to effect the sale, are:

(1) Depreciation $200.00 Depreciation Reserve Machinery $200.00 Accrued depreciation to date on the asset sold.

(2) Depreciation Reserve Machinery 1,200.00 Machinery 1,200.00 To write down to appraised value the asset sold.

(3) Cash 4,500.00 Machinery 3,800.00 Profit on Sale of Machinery 700.00 To record sale of machine and the profit on it.

CHAPTER XVII

BUILDINGS, LAND, AND WASTING ASSETS

Definition of Real Property

The movable fixed assets—paradoxical as the limiting adjectives may seem—having now been considered, the present chapter will treat of the immovable tangible fixed assets. By immovable is meant real property as distinguished from personalty, and by tangible the intention is to exclude from the present consideration such intangible items as good-will, patents, copyrights, trade-marks, franchises, and the like.

In accounting for this group of assets there is no place for the caption “real estate.” In its stead the two titles, “land” and “buildings,” are used. This is to avoid confusion and to afford a better basis for calculating depreciation. The term real estate or real property has a very definite legal connotation, but in the popular mind is held to include land and buildings. From the accountant’s point of view there is no objection to the use of the term in the balance sheet, but in the accounts themselves the two assets should be carefully separated. For the private commercial enterprise, land as a fixed asset is subject neither to depreciation nor to appreciation; whereas buildings are constantly depreciating in value. While depreciation can be calculated with fair accuracy on the combined basis, the single basis of building values is the only scientific basis. The separation of the two values is also essential for insurance purposes and the proper adjustment of fire losses. They will therefore be separately treated in this discussion.

Cost of Buildings

Buildings as fixed assets should be valued by the formula for the fixed asset group, viz., full cost less depreciation. Some points in connection with proper methods of accounting and special cases of valuation require comment.

First, as to making the proper record of cost of the buildings. Three cases must here be considered:

1. If the building is purchased outright for cash, whatever costs are incurred in securing full title and expert opinion as to the sufficiency of the title are proper charges against the building. If the building is erected on contract, the full cost of the contract and any necessary supplementary charges comprise the carrying value of the structure.

2. If the building is bought by the issue of stocks or bonds, the present value of those securities and all costs in connection with their issue should constitute the cost of the building. Determination of the present value of the securities is oftentimes a difficult matter. When sales on the market take place concurrently, that determines the price. When, as is usually the case, several existing companies are bought up or merged to form a larger company, the old stockholders are given shares in the new company for their equities in the old. The book value of their old holdings may be the basis for the issue of the new stock or the issue may be on the basis of a larger or smaller value than this. This whole question of the value of the assets taken over is equally a question of the value of the securities issued therefor. This is considered in full in Chapters XX and XXI and will be given only brief treatment here.

Manifestly all considerations relating to buildings purchased by stocks and bonds have equal application to all other fixed assets so purchased, and the treatment in later chapters will therefore be more inclusive than could be any statement of the case applicable

only to buildings. It suffices to say here that usually the par value of the securities issued constitutes the value placed on the assets bought. The valuation as a rule is made by an appraisal committee from the board of directors which inspects the various properties taken over and places a value on them. In the absence of fraudulent intent, the courts will usually sanction and uphold these values as having been made by interested parties competent to act. This is the method generally used for injecting water into properties.

3. When buildings are put up by the concern itself, full cost may include not only cost of material and labor and a fair proportion of the overhead where supervision of construction is local, but all other expenses directly incurred in connection with construction. These will include architects' fees for plans and supervision, cost of permits and licenses, interest on borrowed moneys and insurance during construction, accidents and injuries to workmen during the construction period, easements, damages, strike costs, and the like. If the structure is being erected on a site occupied by an old building, the cost of wrecking less any salvage value is a proper charge against the new structure. If bonuses have to be paid tenants in the old building to secure release of their quarters, these, too, are similar charges to the new structure. Charges such as interest and insurance during construction are capital charges only up to the point of fitting the building for occupancy and so making it an operating and income-producing unit. Thereafter these must be treated as revenue charges.

Some interesting and at times complicated situations arise when, as in the case of an office building, the structure is occupied in sections as completed. Theoretically, only the portions of the charges of this kind applicable to the completed sections now become revenue charges, the rest still being capitalized so long as sections remain uncompleted. Practically all that is desired is substantial accuracy. The items may be comparatively insignificant but when in doubt the bias should always be on the side of conservatism.

Valuation of Buildings

In the valuation of buildings a much more difficult problem is encountered after the structure is completed and repairs and alterations are made. It is the old problem of the proper differentiation between capital and revenue charges, and is particularly difficult of solution in some instances. Nothing more can be said here than was stated in Chapter V where the fundamental rules to be observed in distinguishing between repairs, renewals, and betterments were laid down. Changes in interior arrangement to accommodate new fixtures and equipment, or a different distribution and arrangement of existing equipment with a view to better operating conditions require particularly careful handling. Such expenses were mentioned in connection with the treatment of machinery on page 290, and the reader is referred to it. Whatever decision is reached on any doubtful item of this or a similar kind, the supporting vouchers, bills, and papers constituting the full evidence should be carefully preserved and made available for review in case of any future questioning of the charges.

Betterments on Leased Buildings

In the case of betterments made on leased buildings, provision must be made to write off their entire cost by the time of the expiration of the lease, as they almost invariably revert with the building to the owner. Sometimes the betterment, if material and so agreed as between lessee and owner, may be taken over at a depreciated value upon expiration of the lease. Here depreciation of the betterment must be provided for. Whether all or only part of the cost of the betterment is to be charged off periodically, record of this is best accomplished as an addition to the periodic rent charge.

Application of Depreciation

As stated above, the basis for valuation of buildings is at full cost less depreciation. It is the method of appraisal, although the inventory may provide a good check in the case of concerns owning many structures. A subsidiary record of buildings showing separate costs and location, or at least a map showing location, may then prove very essential, particularly in the case of fire losses. In the application of depreciation to buildings many things must be carefully considered. Not only must the depreciation of use, i.e., wear and tear and lapse of time, be considered but also obsolescence and inadequacy as factors in shortening the service life of the structure.

Buildings used for some purposes deteriorate more rapidly than when put to other uses. Vibrations, whether caused by own use or due to exterior causes, increase the rapidity of deterioration. Susceptibility to fire, explosion, and the like, due to the nature of their use, should be taken into account. It is stated that power plants operating under normal conditions provide for an entire replacement of plant every five years. Power houses depreciate more rapidly than store houses. A building put to various uses will be subject in its different parts to varying rates of depreciation. Although a composite rate applicable to the whole structure will give a satisfactory valuation, if accurate departmental costs are required it would be desirable to apply the different rates to the building

values distributed over the various departments. In practice this is seldom done.

According to different authorities, rates of depreciation ranging from 1% to 5% constitute a fair average. The nature of the structure, whether occupied by owner or tenant, its location, kind of composition, etc., are additional factors for consideration. While some authoritative rates are available, no standard rates, unless compulsory, should be used without a careful study of local conditions. Structures which are temporary should, of course, be charged for their net cost, i.e., full cost less salvage value, against the product or the job which makes use of them. Other cheap structures such as mine buildings, shaft houses, temporary housings for lumber mills, and the like, should be written down very rapidly. Having practically no realizable salvage value and their life being brief, they should be charged off the books at least during the period of their use.

Buildings owned as a freehold for life, or, stated otherwise, a life interest in buildings, are not subject to depreciation, the remainderman taking the building in its condition as released by the party owning the life interest.

Accounting for Land

In accounting for land as a fixed asset used in the conduct of a business, one or more accounts may be carried as seems best. If the land is in several different plots, perhaps widely separated and each plot held with other groups of assets and under varying conditions as to taxes and other obligations, some plots being subject to mortgages and others not so subject, separate accounts with each plot would be desirable. Otherwise, usually the one account will suffice.

The record should be as complete and full as possible. Notation after the title or elsewhere, giving the description and location of the holdings, is an advantage as a means of exact reference. The various items in the account should be supported by full explanatory matter together with documents available for the analysis of the various items and proof as to their legitimacy. It should thus be possible, at any time, to determine the items comprising full cost. The purchase contract price, the attorney's fees, and broker's commissions or a fair portion of the purchasing agent's salary, the costs of search and guarantee of title (if these are borne by the purchaser), notarial and recording fees, the assumption of taxes owing at date of purchase, local improvement taxes and assessments, such as sewer, water, curbing, paving, and the like—all these should be indicated with clearness and definiteness.

Where accounts with a "large number" of plots are kept, it may be advantageous to carry these accounts on a subsidiary record specially ruled to give the detailed information desired and control them all by one general ledger account. Local conditions and the information desired will determine the manner of keeping the records. In all cases, the account should carry a notation as to where the supporting legal papers and documents covering each parcel or plot may be found. This prevents much needless loss of time and worry when quick reference to those papers is desired.

Valuation of Land

The basis for valuing land with unclouded title, as a fixed asset for business purposes has already been clearly indicated. Full cost, usually with neither depreciation nor appreciation, constitutes the valuation formula. By full cost is meant complete cost in condition ready for use or, at least, up to full-title date. In addition to the items enumerated in the preceding section, there may sometimes properly be included such expenses as leveling, grading, filling, and draining. Even the costs of dikes, dams, and embankments, and in the case of railway construction the cost of the care and up-keep of _growing_ trees planted to prevent land or snowslides, tunneling, and the like, may be carried as a part of land costs, although some of these may more accurately be recorded as improvements. In the case of mining land, the cost of stripping the surface to reach the ore body, and the cost of shaft-sinking and of tunneling are proper capital charges and may be recorded under the land account, although preferably under a development account.

Whatever costs are necessarily incurred to make the land serve its intended use are proper capital charges and should be recorded in the land account unless better purposes are served by record in some supplementary account.

Depreciation or Appreciation of Land

The relation of depreciation and appreciation to land valuation is not difficult in theory but is often very perplexing and gives rise to complicated situations in practice. In theory, so long as the land is used for its intended purpose, fluctuations in the market either up or down should not affect the valuation at which it is carried on the books. Just as with the equipment group of assets discussed in Chapter XVI, any increase or decrease in the value of the land cannot be realized so long as the land is employed in operation. Its cost represents the capital tied up in it and the amount on which profits must be earned. This is therefore the value at which it

should be carried on the books. Sometimes other considerations than those of accounting influence business policy in connection with the market value of land; but so long as it is used for the business purposes for which it was purchased, full cost price should be its valuation. This may sometimes place a prospective borrower at a disadvantage when using his balance sheet as the basis for credit. A footnote or other notation giving market value will usually suffice, although such value is often difficult of determination without a disinterested appraisal.

Appreciation of Land Values

When land is held over long periods in a growing community, appreciation in value almost always results; occasionally depreciation ensues. The amount of appreciation is oftentimes not as much as it seems because land with buildings on it may not be convertible to some other use at the market price of similarly located vacant land; the cost of scrapping the buildings often being as much or more than the appreciation in land value. Also, appreciation may sometimes be of a temporary character, in the nature rather of a market fluctuation. If so, the distinction must be carefully observed. Perhaps in the majority of cases requiring consideration, appreciation not only is very real but also very considerable.

It may sometimes be desired to base an issue of bonds on real estate—land and buildings—which is being carried at an old cost figure as of many years ago but which has a greatly appreciated and available market value at the present time. Prudent financial considerations would require an independent appraisal to determine the amount of the bond issue. Upon the assumption that the issue is for a larger amount than the original cost of the security, a peculiar situation arises. In showing the transaction on the books and balance sheet, not only would no margin of security appear, but even an insufficiency of security so long as the original value of the security is carried. Here it would undoubtedly be wise to bring the appraised value of the security on the books, offsetting the appreciation in value by a suitably named surplus or reserve account, such as “Reserve for Land Value Increment” or “Appreciated Land Value Surplus.” Another method and perhaps a better one where possible of application is to reorganize the concern by a sale of the old to a new company and so capitalize the increment in value of the old company’s assets.

Another financial consideration in connection with appreciated real estate values concerns the advisability of the sale of the old and the erection of a new plant on less valuable land. Usually, the appreciation of land values is not reflected in increased profits; it may even result in lessened profits due to higher rates of taxation and other expenses. If there are equally favorable locations for the particular kind of business, it may be the part of business sagacity to use the old location for rental purposes so that the benefit of the appreciation may be secured, or to sell and move to a less expensive site. In the one case the status of the land has been changed from that of an operating fixed asset to an investment, perhaps best considered permanent. In the other case, the increased value is through sale realized in a lump sum and, as a surplus item, is available for any purpose to which surplus may legitimately be applied. Of course, the amount of such surplus is the difference between the sum realized by sale and the cost of an equally efficient plant on the new site. It will usually happen that a better plant is erected, thus consuming some of the surplus arising from the sale.

Depreciation in Land Values

In a great many instances land depreciates. Decrease in value due to use will be considered under the discussion of wasting assets, page 311. When land suffers depreciation it is usually because of obsolescence or inadequacy. Due to certain natural facilities giving out, or to the removal, dismantling, or decay of artificial facilities, a site may depreciate so much as to become untenable. Business and residence property in a mining town may be of mushroom growth and have practically no value when the market, which is dependent on mining operations, declines. Ventures of this sort are recognized as highly speculative from the beginning and should be handled as such in the accounts. Wherever depreciation due to these causes can be foreseen, suitable provision should be made; otherwise the burden will fall entirely on the period when the plant has to be abandoned and this stage is usually preceded by periods of lessened profits. Depreciation of land is therefore always a local question.

Valuation of Land Investments

Business considerations oftentimes make advisable the purchase of adjoining or otherwise located tracts of land, with an eye to the future when enlarged facilities will be required. These should be carefully differentiated and segregated in the accounts from the land in use for business purposes. Some points in their valuation, in addition to those treated under the discussion of investments in land on page 278, need to be considered. Such tracts of land may usually without prejudice be valued at cost.

If later developments should turn out as originally expected, there can be no objection to loading the carrying costs of these lands, including taxes and interest on any borrowed purchase money, on their value year by year. The only reason for their purchase at the present time is because it is expected that the transaction can be more advantageously made now than later. If such should not be the case, the cost of the land proves to be higher than if purchased later. Only by loading these carrying charges can this information be developed. If the land is finally put to its intended use, no serious objection is seen in carrying it at the figure of full cost to the date of use. Because of the speculative nature of the transaction, it is usually advisable to set up a reserve of the same amount as the accumulating carrying charges. This reserve becomes free when the land is put to its intended use.

Because of the ease of inflation of values in transactions of this kind, due largely to an overoptimism as to the future and even sometimes to fraud, all such transactions must be scrutinized very carefully and ample provision against an unfavorable outcome should be insisted upon. It is interesting to note in this connection that in the case of valuations for rate-making purposes, as a usual thing carrying costs on land of this kind are not allowed as expenses to be covered by the rate of the service rendered. But when these lands come into use such expenses become a part of the cost of the service.

Mortgages on Land

Mortgages on land require consideration as affecting the manner of showing the land value. Freehold land, i.e., land held in fee simple, if afterwards mortgaged should be shown on the balance sheet at full face value with the mortgage listed among the liabilities. The liability is usually a note or other bond which in case of the deficiency of the security would be a general claim against the free assets of the concern. It is therefore best, theoretically, not to show such a mortgage as an offset to its security. In the case of the purchase of land subject to mortgage without the assumption of the mortgage as a direct liability, theoretically the mortgage may be shown as a deduction from the full land value and only the equity value of land be extended as a significant asset. This differentiation is almost entirely an academic one and is seldom seen in practice. The land is usually listed among the assets and the mortgage as a liability.

Donated Land

The valuation of donated lands presents some interesting points. A town may offer a free site to secure the erection of a plant within its midst rather than allow it to go elsewhere. Sometimes the donation may be outright and absolute; at other times it may be conditional, depending upon the doing of certain things by the donee, such as the employment of a minimum force of men for a certain number of years, or the circulation of a certain amount of advertising, or the purchase of given amounts of raw material supplied locally. In the case of an outright gift, the cost to the company is usually nil, but for the proper statement of the concern's financial condition the land must be shown as an asset. If the acceptance of the gift necessitates the scrapping of the old plant and removal expense to the new site, such costs would provide a minimum carrying value for the land. Where this is not the case, the land might be given a nominal value, with suitable explanation.

Usually, however, neither of these methods is so satisfactory as that of bringing the land onto the books at a fair appraised value and showing the contra side of the transaction as surplus, or donated surplus, or donated land surplus. Any gift received increases the proprietorship of a concern and should be so shown, and there need be no suspicion of inflated value in such a surplus item, if conservatively set up, and with the supporting records available. Any expense in connection with the acceptance of the gift is a proper charge against the donated surplus. Aside from this, it is free surplus available for customary uses so far as this transaction is concerned.

In the case of a conditional gift subject to reversion until the satisfactory fulfillment of the condition, no title nor asset value, other than a contingent one, inheres in the land. It is not therefore proper to show any. If a condition, extending over a period of, say, five years must be met, at the end of the first year one-fifth of the time has elapsed and the condition is nearer to fulfillment—the contingency has become more nearly a fact. But until its full satisfaction and the danger of a lapse has passed, there is no value in the gift. To show the progress and status of condition, the pro rata portion of the gift may be shown periodically by a charge to Donated Land or Equity in Land, offset by an equal credit to some suitable reserve such as Donated Land Reserve or Unrealized Profit on Land. On the balance sheet the reserve would be treated as a valuation item, no value being extended among the assets. This would seem to satisfy all demands for information and show the exact status of the transaction.

Land as Stock-in-Trade

A final consideration, not logically belonging here but treated as a matter of convenience, is that of land as stock-in-trade. In the case of a land company developing a tract of land for certain purposes, the individual plots, or the whole piece if division is not contemplated, constitute its stock-in-trade and it should be valued as such, i.e., as a current asset and not a fixed. All costs necessary to put it in condition ready for the market are capital charges and should be loaded onto the cost of the lands. These include all of the usual costs mentioned in connection with land as a fixed asset, and in addition all improvement costs such as parking, the laying out of streets, roading, etc. The loss in the use of land for these purposes should be prorated over the plots, or otherwise equitably distributed. Plots of land so developed are not usually sold all at one time. Any unsold plots should be inventoried at cost. Sometimes the first plots may be sold at a loss to make the rest of the proposition move. The practice is met of loading the loss in the early sales onto the unsold plots, and it is quite common to add any carrying charges to the cost of the unsold plots.

Both of these practices are to be deprecated and opposed. They are not right in theory and serve no necessary purpose. All costs after the stage of sale is reached are operating costs—charges against revenue which should not be capitalized. It may be desirable to know at what price the unsold plots must be disposed of to cover all expenses and losses and to make a profit, but that does not justify an inflation of the carrying values of the asset. If it is desired that the books shall show this, an amount equal to these costs and losses may be added to the carrying values if offset by a valuation reserve of equal amount, the costs and losses themselves being handled as operating expenses of the current period—or spread over several periods if applicable.

Wasting Assets—Definition and Characteristics

Wasting assets, as they are usually called, are better described as assets subject to depletion. They differ from depreciating assets in that, whereas the latter wear out through use or the effect of age, wasting assets simply “give out.” They are subject to depletion because they comprise stores of raw materials and natural resources the supply of which, through being mined and disposed of, is definitely and finally diminished. The stores will in every case finally come to an end through yielding up their product. Examples of enterprises of this kind are minerals and deposits of all sorts, such as coal, gold, silver, lead, clays, slate, gravel, stone quarries, oil, asphalt, nitrate, timber, and “all growing plants yielding recurring crops, such as tea and rubber.”

Dividends May Include Return of Capital

The law recognizes the distinction by requiring in the case of depreciating assets that the decrease in value must be made good before the payment of dividends—i.e., dividends cannot be paid out of capital—while in the case of assets subject to depletion it is recognized that some portion of the dividends paid may represent a return of the capital originally invested in the undertaking.

If the latter is the policy pursued, there will be no liquidating dividends at the time of the break-up of the undertaking, inasmuch as the regular dividends have already included a return of all or some portion of the capital. If, however, it is a matter of business policy to continue the enterprise elsewhere when the present natural stores are exhausted, then the dividends should represent only profits. During the process of operation, assets in other forms which represent the capital investment of the undertaking are retained in the business. This is accomplished on the books by a charge to each period’s operations of such an amount as represents the depletion of the stores of product prepared for the market during that period and by a credit to a depletion reserve account or direct to the property or stores account.

Basis of Depletion Charge

The amount of the period’s depletion charge is reckoned by comparing the amount of product worked during the period with the total estimated amount owned. Whatever value was taken for the original purchase, that value becomes the basis for the annual or periodic depletion charge. There is, of course, a large element of speculation in some estimates of this kind. In the case of timber, the original amount purchased is easily determinable with fair accuracy by _cruising_; the amount cut each period is a matter of record. The ratio of the amount cut to the original amount is the portion of the original value or cost of the timber tract to be written off periodically. In the case of a mine or pit, the estimate cannot be made with an equal degree of accuracy. Competent engineers do make calculations of the amounts of available ores with sufficient certainty to warrant the expenditures of vast sums in the purchase of properties. If their estimate avails for this purpose, it can with equal certainty be made the basis for the periodic depletion charge. Nice questions arise in this connection when the property is being operated under a lease or on a royalty basis.

Application of Income Tax to Wasting Assets

Under the 1916 income tax law specific provision was made for allowing depletion and the manner of handling it is prescribed. First, for such a charge to be allowed as a deduction, it must be recorded on the books. Secondly, as soon as the depletion reserve equals the capital investment no further deduction can be made—all else is pure income. If, however, it is desirable to carry on the books as an asset the estimated amount of product still remaining in addition to that written off, it may be done, the offsetting credit being to income, which must be shown as income on the tax return for the year in which it was brought onto the books. This new value may be depleted until wiped off the books.

The law as now operated bases value of the asset subject to depletion on the value existing as on March 1, 1913, or at cost or purchase price if acquired subsequent to that date. Because the book values on March 1, 1913 seldom agreed with the estimated values, it was necessary to adjust these by charging the asset, plant, or mining property and crediting an account called “Property Surplus” with the amount of the adjustment where the estimate showed more than the book value. When dividends are paid, if it is the policy to return capital as well as profits, the charge should be made partly against operating surplus for the profits share, and partly against property surplus for the capital share.

Depreciation on Buildings and Machinery of a Wasting Asset

In addition to the depletion charge, proper allowance should be made for depreciation of the other fixed assets, such as buildings, machinery, and the like. The limit of their service life is evidently the working life of the venture, which must be estimated. If there is still operating value in the equipment at that date, this is covered by the higher salvage value taken into account when fixing the depreciation charge.

Unusual Risks

In connection with both the estimate for depreciation and for depletion, the elements of unusual risks, due to fires, floods, and the like, should be taken into account. Their effect might be to cut down the supply of available product and so increase the periodic depletion charge. Another factor, of great importance at times, is the available supply of any auxiliary product needed for the treatment of the main product. Thus, large ore bodies may remain unmined and unprofitable because of the failure of a ready supply of auxiliary material needed in the reduction, smelting, or refining of the ore. This applies particularly to iron ores.

Water Rights

Sometimes valuable water rights are acquired along with mining property, and it may be profitable to utilize them for the manufacture and sale of power long after the depletion of the mine. In that case their capital value should be separated from that of the mining venture, and retained as an investment; or a new company may be formed to carry on the power project after ceasing mining operations.

Leaseholds

On the boundary line between a depreciating asset and one subject to depletion stands a leasehold, i.e., the right of occupancy of premises for a stated term. Thus, a building may be rented for a term of years; or a piece of land may be leased for a long enough period to justify the erection of a building thereon, the building going to the owner of the land as a gift or at an appraised value, or the land may revert in its original condition to the owner upon expiration of the period of the lease, according to the contract. The payment for the lease may be an annual sum similar to a rental charge, or a bonus and an annual sum. In the latter case, the bonus should be treated as a deferred charge and spread as additional rent over the period of the lease.

Leases may run for any period up to 99 years, 63 and 84 years being favorite terms in New York. An original lessee may sell his lease outright for a set sum sufficient to cover the remaining period of the lease, or on an annual rental basis. The set sum is calculated as the present worth of an annuity of the amount of a fair annual rental.

Where property values have greatly appreciated, a leasehold on favorable terms may have a high market value which may not appear on the books or balance sheet. If the terms of the lease call only for a _periodic_ payment like rent, the value of the lease will not usually appear on the books. If the lease is purchased outright for a lump sum or a bonus is paid, some value for it will appear on the books. Where the balance sheet is to be used as the basis for credit, the present appraised value of the leasehold should appear, either in a footnote or preferably incorporated into the balance sheet with an offsetting reserve.

If the leasehold is carried at any value on the books, this must, of course, be depreciated or amortized by the end of the leased period. As stated above, the periodic charge for this is to the rent account and the credit to the leasehold account, writing it down directly instead of by means of a reserve. The straight line method of amortization is the easiest of application, but authorities seem to favor, on theoretical grounds, the annuity method which brings in the element of interest. If the agreement provides for the reversion of the building to the owner of the leased land, then also the full cost of the building must be depreciated over the life of the lease. Any excess of this depreciation over normal depreciation is in the nature of a rental charge but not usually of sufficient importance to require segregation. If the premises must be returned in original condition to the owner, the net costs of demolishing any structures erected thereon must be treated as expenses of the lease and provided for accordingly.

CHAPTER XVIII

INTANGIBLE ASSETS—PATENTS, FRANCHISES, GOOD-WILL

General Considerations

The final place among the assets of the balance sheet is given to the intangible items. Because this class of assets has so frequently been used for doubtful or illegitimate purposes, whatever the value given to them they should be shown boldly in a group by themselves and not merged with the values of tangible assets. Their real value, if any, should be open to verification. To list them with tangible items on the balance sheet is apt to raise a suspicion as to their validity much more than if they are shown in a group by themselves.

Because the assets of this group are intangible is no reason in itself for the hasty judgment frequently made that therefore they are worthless. It is true, as above stated, that the doubtful uses to which they may be put have caused them to be viewed with suspicion. Yet they have an entirely legitimate use and oftentimes constitute the most valuable portion of the assets. Therefore, the values at which these intangible assets are carried on the books should always be open to investigation and capable of verification.

It is purposed here to lay down the principles of the legitimate use of intangible assets, and to point out some of the wrong uses to which they easily lend themselves. The group comprises patents, copyrights, trade-marks, formulas, receipts, franchises, organization expense, going concern value, and good-will.

Patents a Monopoly Grant

A patent is “a grant made by the government to an inventor conveying and securing to him the exclusive right to make and sell his invention for a term of years.” The purpose of the government in making such grants is to encourage and stimulate individual ingenuity along lines that will ultimately redound to public welfare. Letters of patent are in the nature of a monopoly grant but, although extreme care is taken in their issuance to see that they cover really new devices, no governmental guarantee implies that the patentee shall have free and uncontested use of his invention. If encroachment is made upon his rights under the patent, the courts are open to him for protection and similar privileges are extended to all alike. Oftentimes, until infringement proceedings have established a clear and uncontested right and property in an invention, little commercial value attaches to it. Patents therefore tend to create a monopoly in the marketable product protected by them and accordingly have value so long as the right to monopoly continues.

Purchase of Patents

The valuation of patents owned and made use of by a business should always be on the basis of cost. If owned by purchase from the inventor, the consideration paid for the patent constitutes cost. When the consideration is cash, there is no question as to the valuation at cost. When payment is made in the capital stock of the purchasing concern the problem is the same here as in the proper valuation of other fixed assets purchased in the same way, referred to in Chapter XVII. The federal income tax law takes cognizance of this different basis for valuation and attempts to establish a true cash basis by allowing depreciation on patents, when purchased by means of stock, only on the basis of the cash value of the stock. Prevailing practice sponsors the bringing of patents onto the books at cost, as shown either by the cash paid for them or by the _par_ value of the stock issued for them. Except where deceit and fraud are the points at issue, no serious objection can be raised to the practice, for any overvaluation thus occasioned is absorbed in the product by means of the depreciation charge spread over the life of the patent. Any additional costs necessary to secure the full enjoyment of the rights granted under the patent are considered proper charges against the patent, as giving it additional value.

Patents Developed within the Plant

When the patent is not purchased from outside but is developed within the plant itself, only the costs of development and of securing the patent are proper charges to the asset as constituting its value. In some concerns an experimental laboratory is maintained for the purpose of working out improved methods and devices. Much of the work of such a laboratory is often fruitless so far as patentable devices are concerned, but if the entire effort is directed towards the development of patents, then the entire cost becomes a proper charge to whatever patents result from the effort. More often some portion of the laboratory organization is also used for other purposes. However developed, whether in the formal laboratory or in any other way, the full cost of development and of securing letters patent is the figure for the original valuation of the patent. This cost includes the labor and material used in the process, drawings, models—including discarded models—attorney's fees, government fees, etc.

As in the case of purchase, all the costs, whenever incurred, of defending the right to the patent or of prosecuting for infringements constitute additional elements of value, as only by such means can the real holder be made secure in the exclusive enjoyment of his right. It is hardly necessary to point out that if such proceedings and prosecution establish the right of the other party to a device which practically destroys or greatly diminishes the worth of the contested patents, not only must such costs usually be charged against revenue but also the whole or major portion of the value at which the patent is being carried. However, where the development of patents is one branch of a concern's organization, costs of this nature may usually be absorbed by those patents which are successful. Because inflation of values is easy at this point, a careful investigation to establish the legitimacy of all such charges is always desirable. Each case must be judged on its merits.

Patents Purchased and not Used

Patented devices are sometimes purchased with no intent to use them. This may be for the purpose of eliminating competition, of forestalling obsolescence or supersession, and so of postponing the necessity of making expensive alterations that would be required to meet threatened competition, even to the point of scrapping a valuable organization. The ethics of such practice is not under review here. Correct accounting practice justifies the addition of the purchase price of such devices to the value of the asset, patents, and its periodic depreciation in regular course.

Elements of Depreciation on Patents

Patents are subject to depreciation. At the time of their purchase or acquisition, they should be valued at full cost, as stated above. At any subsequent time, value should be calculated on the basis of full cost less depreciation. The elements of depreciation as applied to patents are (1) time lapse, (2) supersession, and (3) obsolescence.

1. _Time Lapse._ There is no such thing as wear and tear on a patent itself, but since the grant by the government is for a definitely prescribed term of years, as each of those years goes by there passes with it some portion of the value attaching to the exclusive enjoyment of the right for the prescribed period. In this country a mechanical patent is granted for a term of seventeen years, after which the patented device or process becomes common or public property. The period allowed for patents covering designs is three and one-half, seven, or fourteen years, depending on the application. Thus, simply through the lapse of time the value of the right diminishes.

2. _Supersession._ If no other causes than time lapse were operative, the problem of depreciation would be a simple one, consisting of spreading the value of the patent over its life. In addition to lapse of time and operating simultaneously with it is the possibility of supersession. Supersession as an element of depreciation is the attempt to measure the probability of the patent's being superseded before the expiration of its term by a better machine, device, or method. The measure of this element of depreciation is always speculative but should be attempted with the best judgment possible.

3. _Obsolescence._ Akin to the element of supersession is that of obsolescence. Obsolescence is particularly operative in cases where the patent covers a product the life of which depends on the whims of fashion. Obviously, when the market for the product ceases, the value of the patent is gone.

From the above it is seen that the three elements of depreciation are usually operative concurrently and the rate of depreciation must take cognizance of them all.

Service Life of Patents

While the vast majority of patents become valueless before their expiration, some few may have a value beyond their protected term. It may happen that the concern using the patent has built up such an organization that competitors cannot with profit enter the field after the patent has expired; or it may have acquired the good-will of the purchasing public to such a degree that buyers come to it rather than to a competitor. In these and other ways the value of the patent may extend beyond its life. This is exceptional, however, and cannot with conservatism form the basis for estimating the service life of the average patent.

The prevailing practice authorizes writing off the value of a patent quite rapidly during the early years of its life when its earning capacity should be at a maximum, leaving only a small part of the value to be spread over its later years. This policy applies to the possession of single or separate patents. An effective method used for extending the life of a patent is the securing of auxiliary patents every few years. Thus an improvement of some part may be patented, without which the use of the original or basic patent would not be worth while. The basic patent may thus have its effective life—though not its legal life—extended almost indefinitely.

Where an additional cost, such as infringement costs, is incurred some time after the grant is made, strict accuracy would demand that these costs be spread over the remaining life of the patent. Where, however, the above policy of securing periodic improvements is in force, sufficiently accurate results are secured by wanting off at the end of each year—in the case of mechanical patents—one-seventeenth of the total values to date. In this way, by the end of the original 17-year term, there will be values left in the account which may be looked upon as applicable to the patented improvements. There is in these cases a constant overlapping of the grant periods and no serious inequity results as between fiscal periods by writing off each year one-seventeenth of the total value in the Patents account. In the case of the one original patent or an _occasional_ improvement, the more accurate method is desirable because here the life of the patent is rather definitely limited.

If the estimated life on which the depreciation estimate is based, should prove longer than the real life, the value remaining in the asset at the end of its real life must be absorbed by the profits; i.e., charged against surplus. The Federal Income Tax Law allows this remaining value to be charged against the profits of the period in which it is written off.

Booking Depreciation on Patents

In booking the depreciation of patents, the periodic charge is to the expense account, Depreciation—or Depletion—and the credit is made either direct to the asset account or to the corresponding Depreciation Reserve account. It is sometimes argued that since the life of the patent is for a definite term, its depreciation is equally definite and the value of the asset should be written down rather than carry the estimated amount of the periodic depreciation in a reserve account. Because of the elements of supersession and obsolescence on which in the majority of cases the service life of the patent depends more than on its time grant, it is evident that determination of the amount of periodic depreciation is just as much a speculative estimate as is the case with any other asset. Either method of showing the periodic value of the patent may be used with equal propriety. If an easy determination of “total value to date” is sought, as under the policy referred to above, the information is better secured by carrying the offsetting estimate of depreciation in a reserve account. When no such purpose is to be served, it is a needless multiplication of accounts to use the reserve account.

Accounting Classification of Depreciation on Patents

A problem closely related to the valuation of patents has to do with the classification or incidence of the periodic depreciation of the patent. According to some theorists it is stated that if the patent applies to the _process of manufacture_—i.e., to any part of the manufacturing equipment used—the periodic depreciation is a cost of manufacturing and should be allocated to the product at that point. But if the patent covers the _article itself_, its periodic depreciation expense should be treated as a selling expense. Perhaps the point is well taken but the distinction is rather finely drawn. Another view requires the showing of depreciation on patents among the general administrative items, on the several grounds that there is no logical basis or method for distributing it directly to the product; that there is no direct connection between the product and this expense; and that it is a general overhead item which must be cared for out of gross earnings but cannot be applied definitely to manufacturing or selling. Failure to establish a suitable basis on which to apply the cost in practice cannot, of course, be allowed to militate against the determination of its theoretical incidence.

Royalties

An analogous problem arises in the treatment of royalties where such cover the cost of renting the patented devices of others for the purpose of manufacture. Although the general practice is to treat this expense as a cost of manufacture, it is sometimes handled as a general management expense on the ground that it represents a policy of management which has adopted the royalty

method of production in preference to the outright purchase or development of the patents. The point seems not well taken, however. The value of a patent may be looked upon as a prepaid expense item which is the equivalent of royalties expense and should therefore usually be treated as a manufacturing cost. There may be instances, however, where such treatment would not be advisable on practical and perhaps theoretical grounds.

Relation of Depreciation Rate to Cost of Manufacture

Related to this problem of patent costs is the effect on manufacturing costs of the rate of depreciation of the patent. It is evident that a too rapid depreciation will result in an inequitable loading of the product made during the early years of the life of the patent as compared with that of its later life. A product made under a patent still valuable after all value has been written off the books, bears none of the burden though enjoying the benefit accruing from its being a patented article. On the other hand, if the rate of depreciation is not rapid enough, the product is then underburdened. It should constantly be borne in mind that depreciation is always an estimate. It should be the best estimate possible and subject to periodic revision where accurate results are desired. Slight inaccuracies and inequities are bound to occur and must be absorbed by the future product; the record of the past is a closed book and cannot usually be reopened.

Sale Price of Patents

The sale price of a patent, as distinguished from the value at which the owner may carry it in his accounts, frequently is based on the estimated savings in royalties which could be made by a purchaser. When a new concern is organized and patents are owned by some of the incorporators, and purchased from them, the value at which they are carried is almost always speculative and arbitrary. A valuation based on the saving in royalties has no place on the books of a concern unless that price were paid in purchase. Similarly, licenses to use patents should not be carried as an asset unless purchased by a lump sum payment even though they grant a virtual monopoly in the product.

Copyrights

Copyrights are similar to patents in that they secure to the author or publisher the exclusive right for a term of years to make and sell copies of literary or artistic productions. They are thus in nature a monopoly grant. The term for a copyright is 28 years, with a renewal privilege of 28 years if application is made within one year prior to expiration of original copyright.

A more rigid application of the principles of valuation enunciated for patents must be made for copyrights. On the books of the original grantee they should be carried at full cost which may be only the fees required in securing the copyright. For a subsequent purchaser they should be set up at full cost to him. A much smaller proportion of copyrights than of patents continue valuable for their granted term. Periodic valuations, then, require a very liberal and rapid depreciation from original value. In the accounts of publishers who make outright purchases of copyrights, extreme care is needed in keeping track of and valuing this asset, else a too optimistic outlook will result in carrying false and misleading values. Oftentimes the only satisfactory and reliable method of valuation will require an examination of each copyright owned and an independent appraisal of its worth.

Trade Secrets

Akin to copyrights are formulas for manufacture, receipts, and other trade secrets. These may constitute very valuable holdings, perhaps the most valuable of all the assets, but they are not usually carried on the books as assets under this title. A baker with a secret economical process of making yeast may have a marked advantage over competitors. An oil refiner with a process which secures a larger return of gasoline has a similar advantage over competitors without such means of refining. If costs are incurred in developing or acquiring these formulas or processes, the same reason exists for treating them as assets as in the case of patents or copyrights. If not protected in any way by the government, greater need of rapid depreciation is apparent as the discovery of the secret by others might greatly reduce its value.

Trade-Marks

A trade-mark is an earmark of ownership for advertising and selling purposes. Thus a firm may adopt a label for their products or a manner of marking or displaying them which wherever used is evidence of the make, brand, and quality of the goods. A concern enjoying a trade built up by educating the public to recognize its trade-marks and what they represent may possess therein a very valuable property. The courts of the country guarantee the rightful owner in the exclusive enjoyment of any benefits arising from the

use of his trade-mark. Priority of continuous use is the factor determining rightful ownership. Such priority is most easily established through registration of the trade-mark with the government. Registration is not necessary but is offered by the government as a convenient and certain means of establishing rightful ownership. Continuous use is necessary to retain unquestioned ownership of the right.

Trade-marks must be valued at cost. Cost to develop, cost of purchase, cost to defend—all are legitimate charges to the asset. At times even some portion of the advertising expense may be capitalized under the caption “Trade-Marks.” This question and that of periodic revaluation follow so closely the principles of revaluation of good-will and the treatment of depreciation in relation thereto, that its consideration is deferred for combined treatment in later pages of this chapter.

Franchises—Definition and Kinds

A franchise is an intangible asset of considerable value in most cases. Its appearance on a balance sheet is usually limited to those of public, or quasi-public, utility companies. There it is included as an asset of value from the standpoint of rate-making rather than for ordinary commercial purposes. Such companies are usually under the close supervision and regulation of public service commissions. The latter prescribe the manner of showing the utility company’s accounts and the basis for the valuation of its assets, chiefly from the point of view of an adequate protection of the interests of the public. It is neither the purpose nor within the scope of the present volume to raise the question of the valuation of public utility companies, part of which problem would be concerned with the valuation of franchises. An attempt will be made, however, to lay down some principles of valuation from the commercial standpoint as distinguished from the rate-making standpoint, applicable to a very limited number of concerns which are not subject to state regulation, and to indicate briefly the tendency of the rulings of the best public service commissions with regard to franchises.

A franchise is defined by H. A. Foster[45] as “a privilege given by the community to a private person—or corporation—for use of the public property for the benefit of the public, and only incidentally is it the intention of the community in granting such a right, to allow the person accepting the same enough profit to insure his willingness to take advantage of it by investing in plant to make use of the grant.” To the same effect is the statement of the Federal Court in the case of the Consolidated Gas Co. of New York, 157 Fed. 373: “The franchise is but a part of the power or privilege of sovereignty allotted to a private person for the benefit of all, and only incidentally given for private emoluments.”

[45] In “Engineering Valuation of Public Utilities and Factories.”

Franchises may be perpetual, where the grant is without time limit; limited, where the term is definitely stated; and indeterminate where the privilege granted is good “during good behavior and may be terminated by the authorities at any time by paying the fair value of the property exclusive of the franchise.” It may be noted that in Massachusetts no provision is made for buying the property of the utility company in case of revocation of the franchise. Manifestly the contract entered into with the state will influence very largely the manner of handling and the valuation of all the assets. Without regard to such contract and on the general principles of valuation as laid down for fixed assets, a franchise should be taken onto the books at full cost to acquire. Proper charges to the account would cover:

1. Lump sum payments to the state or some division thereof, applicable to the life of the franchise as distinguished from regular annual payments which are in the nature of a license or rental charge and are therefore an operating expense. 2. The full purchase price paid another company for the assignment of its rights and privileges under a franchise owned by it. 3. Legal and other fees in connection with securing the grant. 4. Any other legitimate expenses, such as the cost of securing the consent of affected property owners or of the whole community where such cost is to be borne by the petitioning company.

All of these are costs which from the standpoint of good business practice may be capitalized under the caption “Franchises.”

Depreciation on Franchises

For periodic revaluations, depreciation should be in accordance with the terms of the grant. If the grant is perpetual, no depreciation need be taken account of; if it is for a limited term, the cost of the franchise should be prorated over that term; if the grant is indeterminate, as defined above, not only should a very liberal depreciation policy be pursued with regard to the franchise but, in the case of the type of franchise granted by Massachusetts, a liberal provision for writing off all the assets should be made, unless in the execution of the law a policy of non-revocability of franchises has become fairly well fixed.

In contrast with the above, note the ruling of the Public Service Commission for the First District of the State of New York. “To this account—Franchises (Gas)—shall be charged ‘the amount (exclusive of any tax or annual charge) actually paid to the state or to a political subdivision thereof as the consideration for the grant of such franchise or right’ (Section 69 of the Public Service Commissions Law) as is necessary to the conduct of the corporation’s gas operations. If any such franchise is acquired by means of assignment, the charge to this account in respect thereof must not exceed the amount actually paid therefor by the corporation to its assignor, nor shall it exceed the amount specified in the statute above quoted. Any excess of the amount actually paid by the corporation over the amount specified in the statute shall be charged to the account ‘Other Intangible Gas Capital.’ If any such franchise has a life of _not more than one year after the date when it is placed in service_, it shall not be charged to this account but to the appropriate accounts in ‘Operating Expenses,’ and in ‘Prepayments’ if extending beyond the fiscal year.” To a depreciation account called “General Amortization” is to be charged, besides depreciation of tangible fixed capital, “such portion of the life of intangible fixed capital as has expired or been consumed during the month.”

Such careful regulations as to the content of intangible asset accounts are not always nor everywhere imposed at the present time. It is not putting the case too strongly to say that the reader of a balance sheet containing items about which practice is not standardized should always be on his guard to assure himself as to the content of such items in order to establish the legitimacy of their use and value.

Organization Expenses

Organization expenses are those costs necessarily incurred for the purpose of getting an enterprise under way, i.e., of putting it in readiness to do business and produce income. These expenses usually comprise such costs as state incorporation fees, attorney’s fees for drawing up the application and other papers, the cost of prospectuses, soliciting costs for stock subscriptions, fees paid promoters and organizers, cost of printing and issuing certificates of stock, cost of capital stock records, and similar items. These are necessary and unavoidable expenses without which the company cannot come into being. A company organized and ready to commence business is in a better position than one whose elements have not been brought into harmonious working. In the same way that the costs of installing machinery in position and ready for use are capitalized by being added to the value of the equipment, so may the organization expenses of a corporation be legitimately capitalized as being the measure of the amount of the greater value which these organized business elements have over the same elements unorganized. Capital has been brought together and set to work, management and plan of operation have been secured, and business is ready to begin.

Organization expenses are therefore, from the standpoint of classification, best treated as an intangible asset rather than as a deferred or prepaid expense. In strict theory the value of these costs will last as long as the corporate existence. In Italy where corporate life is limited to fifty years, it is prescribed that organization costs be prorated over the full life of the corporation. The best practice in this country requires a much more rapid writing off of these items; R. H. Montgomery[46] advocating writing them off as they occur or at most over the first two years’ operation. To one not cognizant of the many abuses which have crept in—and even frauds perpetrated—through this channel, the treatment advocated may seem harsh and severe. Perhaps no harm is done in pursuing a more liberal policy, if such expenses are carried under a proper title, if they are not used to inflate the value of the tangible assets, and if the caution stated above is observed as to the need for investigating the values of all intangible asset items. Certainly organization expense should never be used as a cloak for discount on stocks or other securities marketed.

Good-Will—Definition and Nature

The last of the intangible assets to be treated is good-will. Lord Justice Lindley, in an English case, says: “Good-will regarded as property has no meaning except in connection with some trade, business, or calling. In that connection I understand the word to include whatever adds value to a business by reason of situation, name and reputation, connection, introduction to old customers, and agreed absence from competition, or any of these things, and there may be others which do not occur to me.” The definition by George Lisle[47] is to the same general effect: “Good-will is the monetary value placed upon the connection and reputation of a mercantile or manufacturing concern, and discounts the value of the turnover of a business in consequence of the probabilities of the old customers continuing.” Good-will therefore includes every advantage connected with location, premises, reputation, personality, name, etc. That all these are elements of good-will cannot be gainsaid, but unless an earning power larger than that of a newly established competing concern goes along with these elements, no one would be willing to pay anything for the good-will of the old concern.

[46] In “Auditing, Theory and Practice.”

[47] In “Accounting in Theory and Practice.”

It sometimes happens in the case of a merger, that because of the dormant or latent good-will of the various units—or some of them—to be merged, a promoter may be willing to pay something more than the value of the tangible assets in order to acquire the various properties. Dormant or latent good-will signifies the excess earning power that would exist if it were not for poor management, an inharmonious working together of the various parts of the organization, and other similar handicaps which the new management will remove. It may be objected that until such handicaps have been removed there is no good-will; that any good-will brought into evidence through the removal of these handicaps is the good-will built up by the new concern and not the old. It cannot be denied, however, that all the other elements of good-will may have been acquired and built up by the old company and that without them the new concern would be unable to bring good-will into evidence simply by a change of management. It is true that the merger may be able to build up quickly a good-will of its own through the elimination of competition, and through the full utilization of all the advantages of the different units—such as access to supplies of raw material, favorable trade agreements of various sorts, and the like.

While there is a sense in which expected future performance as indicated above, may be an element in the determination of good-will and may be legitimately paid for as such, as a usual thing the essence of good-will lies in the ability to make a profit in excess of the normal. Past performance must be reviewed by which to judge the normality of the present profits and the probability of their continuance in the future.

Local and Personal Character of Good-Will

It should be pointed out, as a corollary to the above statement that only those elements which are transferable and are transferred can be disposed of for a price. Thus, when a business goes to the new owner, if there is apt to be a very appreciable shrinking in profits—as is the case in the transfer of some professional businesses—or if the favorable location on which in some cases depends the ability to earn excess profits cannot be turned over to the purchaser because of the expiration of the lease or other reason, good-will may not be worth much to a prospective purchaser. There is thus a local and personal character to good-will which cannot be ignored.

Difficulty of Valuing Good-Will

The valuation of good-will presents at times many complexities. The general principle of valuation at cost—and not market—may be said to apply here, too. What constitutes cost is sometimes difficult to determine. A corporation which buys out an existing business, paying an agreed sum for the good-will, should set up on the books that sum as the value of good-will. The vendor concern during the years of the establishment of its good-will, unless specific expenditures were made for that purpose, should not show any value for it on its books. In an English case, Stewart v. Gladstone, 1879, the court said: “Is it reasonable ... that a changing thing like good-will, the value of which would vary year by year according to the state of the trade ... and to the reputation which the house had acquired or had lost for integrity, punctuality, solvency, and mercantile prudence, was to be valued from year to year,” and the increase or decrease was to be treated as profit or loss for the year and distributed?

The impropriety of bringing good-will on the books unless paid for by purchase or otherwise, is established and rests on principles of sound business.

Creation of Good-Will by Advertising

There is perhaps only one case in which a concern which has not acquired good-will by purchase but has built it up for itself may with propriety set up its value on the books. Creating a demand for a product by means of extensive advertising is one of the quickest ways of building up good-will. The difference between the cost of the advertising necessary to retain a given volume of trade—which we may call the normal advertising expenditure—and the cost of the publicity required to secure that trade may be treated, in theory at least, as an expenditure on account of good-will and be so shown on the books. This is usually a difficult matter to determine at the close of the publicity campaign and before the cost of normal advertising is known, and the valuation at best is somewhat speculative. But where handled carefully and with conservatism there seems no serious objection to bringing good-will on the books at a value calculated in this way.

Unless it is possible to treat some expenditures of this sort as the direct cause of good-will, the evidence of the possession of good-will must be sought in the profit and loss record rather than in the balance sheet, as its existence would be indicated only by

above-normal profits.

Valuation of Good-Will Based on Normal Profits

Valuing good-will for a purchaser is not so difficult. Two standard methods are in use, the one based on profits, the other on excess profits. According to the first, the value of the good-will is estimated as so many years' purchase price of the net profits of the last year; or, better, the average of the last three or five years. This simply means multiplying the profits by the number of years' purchase. The number of years to be used as a multiplier varies from one to fifteen, or twenty in some instances. Thus, if the agreement is to pay three years' purchase of the average profit for the past five years and this average is $50,000, the price paid will be $150,000 and at that value good-will should be shown on the purchaser's books.

Valuation of Good-Will Based on Excess Profits

The other method determines first the excess profits, i.e., the amount by which the profits of a particular business exceed the normal or average figures for that line of business. Thus, if the profits are $75,000 and normal profits are $50,000, the excess earning capacity per period is $25,000. This amount is then capitalized on some arbitrary basis, ranging in practice from the prevailing interest rate, say 5%, to 20% or even 50%. The effect of such capitalization is to apply a multiplier, as in the first method, ranging from 20 to 5 or less. Thus, if 20% is the agreed rate, the excess, $25,000 multiplied by 5 gives $125,000 as the value.

It is, of course, apparent that the valuation of good-will for prospective purchase is largely dependent upon the individual judgment of the buyer and that seldom will any two men arrive at the same valuation. As a matter of prudence, under either method the average profits for the past few years should be used rather than those of the last year. The latter may be sporadic and under conditions such as not to warrant their continuance. An average figure gives a better indication of what the business may be expected to do under normal conditions. Inasmuch as the value of good-will depends on excess earning capacity, the second method of valuation rests on better theoretical grounds than the first. Practically there is no preference, since valuation is largely a matter of personal judgment under either method.

Valuation of Good-Will Based on Capitalization of Profits

A slight variation of the second method is sometimes used. Under it the average net profits are capitalized at some agreed rate, giving the amount of money on which the average profits could be earned at the rate used. The difference between this amount and the amount of capital actually invested gives the value of the good-will. Thus, if on an investment of $250,000 net average profits are $60,000 and the normal rate for this business is 15%, $60,000 would represent a 15% income on $400,000. Good-will must therefore represent the difference between $400,000 and $250,000, or $150,000. This must evidently work out in exactly the same way as the second method if the rate used is the same. Therefore it constitutes not a distinct method, but only a variation. In the one case the difference between the average and normal profits is capitalized; in the other both are capitalized and the difference of their capitalizations is taken.

False Good-Will to Cover Capital Deficiency

A method of valuing good-will which makes it represent the difference between the value of tangible assets contributed or purchased and the par value of the stock issued cannot be countenanced at all. This use of good-will to cover up a capital deficiency is not only improper and misleading but often fraudulent. It is the favorite means by which "water" is injected into corporations. Thus, a concern desiring to capitalize at $500,000 and unable to sell its stock for more than $300,000, might carry an asset, good-will, to take care of the $200,000 discount on stock. A partnership desiring to incorporate might issue for the partnership assets stock with a par value much more than the assets taken over, and either inflate the asset values or set up a good-will account to care for the difference. This practice cannot be too severely criticized. In connection with this it should always be kept in mind that a newly organized company can never include good-will among its assets except by purchase.

Somewhat analogous to the above practice is that of increasing the capitalization of a company and issuing new shares in exchange for the old. Thus a company capitalized at $1,000,000 might increase its capital to $2,000,000, issuing two shares of the new for each share of the old. This will necessitate bringing onto the books an intangible asset, usually good-will, to cover the additional $1,000,000 of stock issued. Sometimes a real good-will may be existent as shown by the abnormal profits. In such cases, the effect of an increase of capital stock will be to keep down the _rate_ of profit on the capital stock and so decrease the market value of each share, but not the real value of the total shares nor the _amount_ of profit distributable to each of the holders

of shares of the original issue. The purpose in such an increase of capital stock is usually an ulterior one, such as the desire to cover up real earnings in order to prevent a reduction of rates, as in the case of a public utility company. The purpose may sometimes seemingly justify the practice. The problem is mainly an ethical one and it is not proposed to discuss it here further than to say that the practice is usually to be condemned.

Periodic Revaluation of Good-Will

Periodic revaluation of good-will must next be considered. This involves a determination as to whether it is subject to depreciation. From what has been established as the essence of good-will, viz., the ability to earn excess profits, it is apparent, as stated in the case Stewart v. Gladstone on page 333, that its value must fluctuate from time to time with the earnings of the business. Because of this changing and at times doubtful value, some authorities advocate its being written off the books periodically, and a good many concerns do so write it off. The effect of this, so long as there is any value remaining in good-will, is to create a secret reserve and this is justified on the ground of conservatism. The practice is not reprehensible, though usually to be discouraged.

The weight of authority is to the effect that all purposes are best served by allowing it to remain always on the books at cost. There is no logical reason for writing it off. When profits are large, good-will is a very real asset. To write it off then is not logically consistent. When profits are small and good-will is accordingly of less value than before, it would hardly be logical to write off any amount less than its decreased value, yet the profits at such a time are rarely sufficient to stand so heroic a treatment.

As was stated above on page 330, all intangible assets should be examined carefully by a prospective purchaser as to the values at which they are being carried.

Good-will, because of the improper and misleading uses to which it has so often been put, is never above suspicion and its value should not be taken without close investigation. If it _really_ exists, the profit and loss record will show it. That should guide as to its valuation and not the value carried on the balance sheet. Accordingly, since the asset does not depreciate but only fluctuates in value, and since it is neither prudent nor consistently possible to take these changing values onto the books, the best course for all purposes seems to be to retain good-will in the accounts always at its cost figure.

The above considerations as to the depreciation of good-will apply with almost equal weight to the depreciation of trade-marks.

In closing this chapter attention should be called to the fact that the term “going value” is used in the case of public utility companies in much the same way as good-will.

CHAPTER XIX

LIABILITIES ON THE BALANCE SHEET; CURRENT AND CONTINGENT LIABILITIES

Form and Valuation

The problem of handling liabilities on the balance sheet is usually not so complicated as that of assets. The questions of arrangement, form, groups, and suitable nomenclature have in the case of liabilities an equal or even greater importance than that of the assets, the governing principle being clearness and fullness in the information given, with due regard to the purpose and intended use of the balance sheet.

The problem of valuation, which assumes great importance in the treatment of the assets, has normally little or no significance in the consideration of liabilities. This is due to several causes. In the first place, human nature being what it is, there is normally little danger of an overstatement of liabilities; they are usually sufficiently large, and no desire exists to make them appear more than they really are. Secondly, and likewise based on human frailty, while a concern may desire to undervalue its liabilities, the other party to the liability, the person holding the claim, can usually be depended upon to press his claim with sufficient insistence as to make the concern aware at all times of the amount of its liabilities.

From the viewpoint of a going concern, while all business experience points to a decrease and a necessary diminution in the values at which certain assets may appear on the books, no such diminution in the value of liabilities can be looked for; as legitimate claims must be met if a business is to exist as a _going_ concern. Similarly, there is normally no tendency to inflate the liabilities by the inclusion of items which do not rank fully in this class—intangible liabilities seldom find place in any balance sheet.

On the other hand, there is frequently a very real hesitancy about the inclusion of some liability items until their claim becomes urgent or their full liability status becomes determined. Occasionally, and usually with ulterior intent, the liabilities may be inflated in value and items included therein which are fictitious; but our present concern is not with such conditions.

The one principle underlying the showing of both assets and liabilities is that their _true_ status should be indicated. As applied to liabilities this means that they should be shown not only in correct amount but also in their true light, viz.: that all facts bearing on their relation to the business which ought to be known properly to judge conditions must be stated. The chief problem in handling liabilities is, therefore, how to show and list them so as to accomplish this purpose of truth and usually the further purpose of full truth. In a consideration of this problem, the auxiliary one of the inclusion of doubtful items among the liabilities will also receive consideration.

Arrangement on Balance Sheet

As to the classification and arrangement of liabilities on the balance sheet, it may be stated in a general way that whatever classification and arrangement are adopted for the assets, the liabilities should be shown similarly. For most purposes a standard grouping under the captions, Current, Deferred Income, Fixed or Funded, will suffice. The order of the groups as given here follows the order given for the assets. This is desirable for purposes of easy comparison, because in this way current liabilities are brought into juxtaposition with the group of assets to which current creditors must look for payment of their claims; and fixed liabilities and capital are opposed to the assets in which for the most part they have been invested.

Items within Groups

Arrangement within the group may be attempted on the basis of relative degree of liquidity of the items. This, however, is not always determinable nor is it an end to be sought; the chief desideratum is to show items in the main group to which they properly belong.

The manner of listing the items within the group is not a question of relative order so much as it is of nomenclature and clearness of expression. Thus, desirable and valuable information would be given by a separation of the items to show (1) those past due; (2) those due but not payable because of their credit term; (3) those neither due nor payable, such as accruing items; and (4) contingent liabilities.[48] It may be remarked that such an analysis is seldom seen on the ordinary balance sheet. Corporations which have to report to a regulating body may be required to give more information concerning their business than those not so regulated. For internal use the suggested analysis has undoubted merit. For public use, it is neither necessary nor usually desirable that the information be given in that form; a showing of the items under the usual titles within the group to which they properly belong being here deemed sufficient.

[48] P. J. Esquerré, in “Applied Theory of Accounts.”

Cancellation of Liabilities against Assets

Occasionally the practice is met of cancelling the liabilities, or some group of them, against corresponding assets, showing only the net assets remaining. Thus, Current Assets less Current Claims might appear as an item among the assets. Even for publication purposes this would not be deemed sufficient; for the outsider as a prospective creditor or investor has a right to judge for himself the relative sufficiency of the assets to meet the claims of creditors. No basis for such judgment is offered by a cancellation of the one against the other with a showing of the net amount only. A somewhat analogous situation arises in the double-account form of statement used by some English companies. Here, the capital assets are canceled against the capital and fixed liabilities and only the net surplus—usually of capital—appears in the balance sheet proper. The criticism is not so pertinent here, however, because almost invariably the balance sheet is accompanied by the so-called capital account which shows the full detail of the net item in the balance sheet. So also, the practice is often condoned wherever an accompanying schedule shows the full facts as to assets and liabilities. As a matter of principle, it should be condemned because accompanying schedules do not always “accompany.”

Inventory of Liabilities

The principle of showing the full truth as to the liabilities raises the problem of the complete inclusion or inventory of the liabilities. Under this will be considered any adjustments that must be made in the book record in order to show the true state of the liabilities, and also the proper treatment of contingent liabilities so as to show their relation to the state of the business.

The adjustment of the book record is not usually complicated. The necessary data are for the most part available. All that is required is an analysis of each item to determine what, if any, adjustment is needed to bring the books to a true statement of conditions as on the date of the balance sheet. These adjustments fall into six main groups, only two of which appear among the liabilities, while one of the others is often based on information obtainable only from an analysis of the liabilities. These groups are:

1. Accrued Expenses 2. Deferred Income 3. Deferred Expenses 4. Accrued Income 5. Valuation Reserves 6. Merchandise Inventory

The first three groups are discussed below, as well as another analogous group.

Accrued Expenses. These expenses comprise the liability existing at the close of a fiscal period because of expenses incurred but not settled for and oftentimes not yet due. Information as to these may be gathered—not in completeness however—from an examination of the various expense accounts and a somewhat intimate knowledge of the operations of the business. Unless a record is kept of all services being rendered to the business, it is very easy to omit some items of this kind. These will be discussed in detail under “Current Liabilities,” page 350.

Deferred Income. This income comprises the items of income received in advance of the full performance of the service required to earn it. In cases of this kind there are in the possession of the business certain assets which must be used to perform the service not yet completed in order to entitle the business to the full enjoyment of the income. That is, the property of the owners is liable for the service not yet rendered. Also, in order to make a correct showing of results as between the current fiscal period and the next, this unearned income must be carried forward for credit in the period in which the service is performed.

Premium on Bonds. Somewhat analogous to deferred income is the item of premium on bonds. As indicated in Chapter XV this is preferably treated as a direct deduction from the periodic interest payments on the bonds, because the bonds were marketed at a rate higher than the interest rate prevailing at the time of their flotation. Inasmuch as the premium must be spread over the life of the bonds, its unexpired portion will appear as of the nature of deferred income at all intermediate stages. A more detailed showing of this is given in Chapter XX, in the discussion of the liability, bonds.

Deferred Expenses. These expenses have been explained in detail in Chapter XIV. Here it is to be noted that, while this group of adjustment items is always an asset, for the proper determination of deferred interest an examination of the liability, notes payable, is often necessary. Notes payable given for a loan at the bank, or given to a creditor, with prepaid interest added to the principal of the debt as a part of the face amount of the note, will give the data for calculation of the amount of interest or discount to be deferred to later periods.

Contingent Liabilities

As stated above, the second group of items under the head of inventory of the liabilities is that of contingent liabilities. It is taken for granted that all items which on the date of the balance sheet have assumed a status of full and direct liability will, of course, appear as such on the books. Here, all that can be said without trespassing on the distinctive field of auditing, is that all such items must appear. For the method of detecting their omission, whether omitted with fraudulent intent or through carelessness and inaccuracy, the student is referred to a standard work on auditing.

We have here to consider, however, a group of items the status of which is one of suspended or indeterminate liability. Expressed otherwise, they are items concerning which it is hoped—it may be even expected—that the business will never incur liability but for which in the event of certain happenings liability must be assumed. There are, of course, degrees of contingency, ranging from almost certainty to negligible remoteness. It would seem that no business man would omit the almost certain type from his books, and in case of doubt prudence demands that decision be rendered in favor of at least the greater probability.

Yet there is often seen a failure to book even the liability on account of goods purchased and shipped, but not received. If it is argued that the liability is not fully established until receipt and acceptance of the goods, every manager knows that non-acceptance of purchases is the exception, not the rule. On the other hand, upon receipt of consigned goods to be sold on account of a principal, no liability except to exercise ordinary care usually attaches to a broker until some part of the goods has been sold by him. Between these two extremes are many shades and degrees of probability, all of which in some cases are recorded as liabilities; in others none are so recorded. The importance of the information as to contingent liability on account of notes receivable discounted and discounted acceptances is now accorded general recognition. As to liability under court judgments awaiting appeal, guarantees of work and product, deposits made on contracts or bids—these and other similar matters will be

treated fully in following pages.

These, then, constitute the main problems in connection with liabilities on the balance sheet. The group of current liabilities will now be considered, followed by a discussion of the nature of contingent liabilities.

CURRENT LIABILITIES

Notes and accounts payable, using the terms broadly, constitute practically all of the current liabilities. Not all notes nor all accounts payable are, however, current items. The term “current” cannot be standardized; it varies and will perhaps always vary according to customs and practices in any particular trade. In the main, the 90-day period may be taken as the average. That is, on the given date of the balance sheet a knowledge of the debts that must be met within the next 90 days is a minimum of necessary information for the purpose of judging business condition, particularly so far as concerns the credit extended to it. When a balance sheet is submitted to the bank as the basis for credit, other data concerning notes payable are usually called for—such as notes given for merchandise, notes negotiated to own banks, notes otherwise disposed of. The Federal Reserve Bulletin for April, 1917, under the title “Uniform Accounting a Tentative Proposal” suggests for balance sheet presentation a list of notes analyzed as to acceptances made for merchandise or raw material purchased; notes given for merchandise or raw material purchased; notes given to banks for money borrowed; notes sold through brokers; notes given for machinery, additions to plant, etc.; notes due to stockholders, officers, or employees. R. H. Montgomery[49] suggests a division of notes into the groups: notes issued for merchandise; notes discounted by own banks; notes sold through brokers; and demand loans. He suggests further that an additional separation into notes accompanied by collateral and notes with which no collateral is given would be desirable.

[49] In “Auditing—Theory and Practice.”

From the above it is seen that the present tendency of bankers is to insist on a full statement of essential facts needed to pass intelligent judgment as to the exact status of affairs. Even in the case of balance sheets, the accuracy of which has been certified by someone, some bankers require a certificate as to the character of the certifier unless he is well known. More and more is the fact being recognized that legitimate business has nothing to fear and much to gain by making a full and free statement of exact condition, and that the sooner business supported by fraudulent statement is eliminated, the better will it be for legitimate enterprises. In certain cases, however, the interests or purpose of a business would not be well served by the detailed information demanded by the banker and, here as elsewhere, no specific rule can be laid down other than that the purpose should in all cases govern the form and particularly the amount of detail.

Loans from Bank

In connection with advances from the bank it should be noted that the banker does not expect to become a permanent partner in the business, but that one of his legitimate functions is to furnish funds for seasonal fluctuations. Oftentimes a concern does not start with enough capital to carry its load of maximum trade, from the fear that advantageous investment of surplus funds during the dull season will not be possible. It may rightly expect its bank to furnish funds for this purpose when expenses are heaviest, and to await repayment of the loan out of the income, as accounts are collected after the peak of the seasonal trade is passed. This is one of the fields of legitimate banking and the banker has a right to whatever information is necessary to assure himself that his aid is being put to proper use.

General Classification of Notes

For general purposes, a separation of notes into notes for trade purposes and notes for other purposes is desirable. Trade purposes would be limited to merchandise purchases and loans for working capital. Other purposes would be long-time loans, purchase money notes often secured by mortgage on equipment, and notes of officers and employees. These last would best be classified by their showing as fixed rather than current liabilities.

Accounts Payable

The use of the term, accounts payable, to cover only creditors for stock-in-trade and other trade purposes is too indefinite and inaccurate, the term being too comprehensive and inclusive. The considerations applying to trade debtors have equal weight in requiring the use of the term trade creditors for the purposes mentioned above. Accounts payable to trade creditors are usually the current items, whereas those payable to stockholders, officers, etc., and those due to a parent or holding company are more or less

fixed, as there is usually no particular urgency as to the time of their payment. An analysis of trade creditors into “not due” and “past due” will at least bring out the information as to neglected discounts and some idea as to the amount of cash needed to pay off debts and to secure their discount.

There is no necessary relationship between accounts and notes payable, nor any significance in their relative amounts. In some trades notes are given in order to obtain the discounts; in others notes are given at the date of purchase of the commodities.

Deposits. Another group of accounts payable of a more or less current type consists of deposits of various sorts. The business may accept deposits from customers or employees for various purposes. Consumers’ deposits with gas and electric light companies as guarantee to cover payment of bills and possible damage to meters or other company property; deposits covering locker privileges, breakage of materials, keys issued, and the like, are examples of this kind. These deposits are seldom all claimed at any one time; experience only can indicate the necessary financial provisions to be made currently for them. In some instances there is an accruing liability on account of interest on these deposits which must also be cared for.

Guarantees. Sometimes goods are purchased and only partly paid for, a portion of the purchase price being retained as a guarantee of quality until opportunity is given for adequate examination and acceptance or rejection. Similarly, in the case of construction work done by contract or subcontract, the owner—or, if a subcontract, the general contractor—retains a certain percentage of the contract price as a guarantee of performance of the whole according to contract agreement. This liability for the portion retained is a current liability, as a usual thing, and is to be listed under accounts payable with suitable subtitle.

Long-Term Notes. Long-term notes and accounts, bonds, and other fixed liabilities become current as their maturity closely approaches and provision for payment must be made.

Future Deliveries. On the border lines between contingent and full liabilities may be classed the liability because of goods purchased with long future dating. This is sometimes allowed by a seller to secure warehouse room for new product. It is undoubtedly best to set up both the asset and the liability, even where the goods have not yet been received.

Consigned Goods Sold. The factor’s real liability on account of consigned goods sold should, of course, be shown as a current liability, offset by any claims for expenses incurred on account of the consignor and any accrued commissions earned on sales to date.

Dividends Not Yet Paid. Another item belonging to accounts payable is dividends declared but not yet paid. Though it may be the custom of a company always to declare a dividend on a given date, no liability is incurred on account of dividends until they are actually declared. Upon declaration of a dividend the company makes itself liable to stockholders for the amount of the dividend. This liability ranks as an unsecured debt on the same footing as unsecured liabilities to other creditors. The dividend liability in large part is usually soon liquidated. Any unclaimed dividends constitute a liability until claimed or authority is given for other disposition. The item is usually small and is best shown as a current liability even though the chance of its being claimed may be remote. The method of handling and safeguarding the dividend transaction is treated in Chapter XXIV.

Accrued Expenses

The final item to be considered among the current liabilities is the group of accrued expenses. These constitute such items as wages, salaries, rents, royalties, expense supplies purchased but unpaid for, interest, advertising, sales commissions, traveling expenses, freights, water and other taxes, etc.—in fact, all services which have been rendered the business previous to the date of the balance sheet but which on that date are unpaid. These usually comprise the most urgent of the liability items and so are properly classed as current. There is seldom any business in which items of this kind are not encountered and, as stated on page 343, a careful examination of the records and familiarity with the business is needed to secure a full statement of them.

With regard to some of these items, difference of opinion exists. It is argued that until the amount of the liability is known, no real liability can be said to exist. Thus, taxes for the current year may not be known until the following year. Proverbially taxes are as certain as death, and there would seem to be no unreality or contingency about their incidence. As the current year passes by, the accounts should include a charge for taxes. Since the real amount is not known, it must be carefully estimated; for any difference must be taken up when the real amount becomes known, and so may disturb and somewhat invalidate the results for comparative purposes. Because of the fact that the current amount is an estimate, the title given the liability thereunder is sometimes called “Reserve for Taxes” rather than “Accrued Taxes.” No matter what the caption may be, it should usually be listed as a current liability.

Booking of Accrued Expenses

As in the case of deferred expenses, so in the booking of accrued expenses, in some quarters it is thought highly unscientific to record both the expense and liability elements in the same account at the time of adjusting the books. Use is made of a separate liability account entitled “Interest Accrued,” for example. When so used immediately at the opening of the new period, this account is either transferred to the expense account where it will act as an offsetting credit to the expense when paid, so automatically reducing the amount to the part properly applicable to the new period; or the account may be allowed to stand untouched (and therefore having no real significance) till the end of the next period when only the difference between it and the new amount accrued is made the basis of the new adjusting entry. Both these methods, while securing a more evident separation of the expense and liability elements, do so only at the cost of a needless multiplication of accounts and work. To one acquainted with the significance of bookkeeping methods, the old way of treating the liability element as an inventory in the expense account makes a definite allocation of the two elements, and does so with less burden on the bookkeeper and is to be preferred in most cases.

Deferred Credits

Deferred credits, as already explained, are analogous to current liabilities in that they represent unearned income. The enjoyment or earning of this income requires the rendering of certain services which are a claim on the current assets. In this sense, then, they belong to the current liability group, for the payment of which the current assets must be available.

NATURE OF CONTINGENT LIABILITIES

Statement of Contingent Liabilities

As stated on page 345, contingent liabilities range from those almost certain to materialize to those extremely remote. For some purposes a full statement of all such liabilities is needed to give an adequate view of conditions within the business. For other purposes, so detailed a statement may not be necessary although usually desirable. The Federal Reserve Board requires on a balance sheet submitted as the basis for credit a full statement of contingent liability as follows:

Kind of Contingent Liability Amount

Upon customers’ notes discounted, sold, or otherwise transferred $..... Upon drafts negotiated ..... For accommodation indorsements ..... For guarantees ..... Upon leases ..... Upon bonds or other obligations of ..... subsidiary companies ..... Under contracts or purchase arrangements ..... Under agreements ..... Under pending lawsuits .....

This company is not a guarantor or indorser of any liabilities or obligations of any individual, firm, or corporation, and it is not liable under any contracts, bonds, or profit-sharing arrangements, or any other agreements, and there are no lawsuits pending except as set forth above.

Sign Company’s name here .....

By .....

N. B. It is most essential that each question be fully answered.

Full answers to the above inquisition would often prove embarrassing but very enlightening. Two additional kinds of contingent liability not listed above sometimes exist, viz.: that arising out of a call for the unpaid portion of stocks owned but not fully paid for; and in the case of a corporation, unpaid accumulated dividends on preferred stocks. Some of these contingent liabilities require detailed consideration.

Notes and Drafts Transferred

The proper method of handling notes discounted, sold, or otherwise transferred, and negotiated drafts is given in Volume I and will not be repeated here. The showing of these items on the balance sheet is by inclusion among both the assets and liabilities, or preferably by inclusion among the assets with the liability element shown deducted. When a person or firm lends its credit by means of an accommodation indorsement, the transaction should be recorded as a charge to the accommodated party and a credit to Notes Payable if the liability is primary; or to Indorser’s Liability, if secondary. In case of primary liability, liability is full and must be listed on the balance sheet as a note payable. In case of secondary liability, liability is contingent, as in the case of discounted

notes, and should be so shown on the balance sheet. In either of these cases, the practice of cancelling the liability against the corresponding asset and by a feat of mental dexterity persuading oneself that there is therefore no need to show the item on the balance sheet, is a practice to be universally condemned.

Guarantees as a Contingent Liability

Guarantees are of many sorts—guarantees of product sold or work performed, guarantees of the good faith of others in meeting their obligations, etc. The transferred note is one kind of guarantee. Oftentimes, a parent company may guarantee the principal and interest or the interest only of the bond or note obligations of a subsidiary. While the expectation is usually that the contingent liability will not become real, yet experience shows the need of making adequate provision against it. The recent example of the Denver & Rio Grande as guarantor of the bond interest of Western Pacific bonds drives home that necessity. In a case of this sort provision is best made in the creation of a contingency reserve, for there is no experience on which to base a better estimate. In the case of a policy of guaranteeing the quality of a product or its workmanship, after a few years' experience very accurate estimates can be made of the loss to be expected therefrom, and at the end of a fiscal period the books can be adjusted on that basis just as they are for taxes. A charge to a suitable expense account and a credit to a reserve or accrued account comprises the book entry, with a listing of the reserve as a real liability.

Long-Term Leases

Contingent liability brought about by a lease covering a long period may be disregarded if the lease has a marketable value sufficient to cover the liability. Otherwise a contingent reserve should be set up. Liability under the subletting of a lease is best handled by means of a reserve.

Purchases for Future Delivery

Purchase contracts for future delivery, if made at a fixed price, may be disregarded unless at the date of the balance sheet market value is lower than cost, when a reserve should be set up. A fuller statement of the facts shows the transaction among both assets and liabilities. If the contract, being speculative, is not at a named price, the showing of the reserve is prudent and conservative.

Pending Lawsuits

In the case of pending lawsuits, the contingent reserve is usually all that is necessary. If the case is on appeal, it might in addition be wise to create a fund which would provide funds for settlement if the decision is unfavorable. Here the item of costs, fees, and accruing interest is usually large and liberal provision must be made.

Stock not fully Paid

Where shares of stock are held which are not fully paid, a liability attaches for the unpaid portion contingent upon call being made for it. Showing the stocks at subscribed price with the offsetting liability for the unpaid amount as a deduction, is perhaps the best method, though there is no serious objection to omit mention of it if the stock has increased in value, or of using the method of a reserve. Where a double liability attaches to stock ownership in case of bankruptcy, no notice need be taken of the contingent liability so long as the business whose stock is held shows an entirely solvent condition. When such is not the case, whatever provision seems necessary should be made, even to the extent of liability to the full value of the stock held.

Accumulated Dividends on Preferred Stock

There is no liability on account of accumulated dividends on preferred stock until profits have been made out of which they may be paid. If the policy of management does not allow their declaration at the present time, although sufficient profits have been made, the accumulation of dividends should be shown as a liability. Where the company is unable to declare dividends because of insufficient profits, mention of the accumulating dividends should be made in a footnote as a possible future liability.

Signature to Surety Bond

The liability arising through signature to a surety bond is a contingent liability resting upon the good faith and honor of the bonded party. The practice of personal bondsmen is not so prevalent as formerly. Experience shows that the liability of the bondsmen may become very real, and not only should suitable provision be made for it but its existence should be shown on the balance sheet.

CHAPTER XX

FIXED LIABILITIES—BONDS AND MORTGAGES

Nature of Fixed Liabilities

Fixed liabilities, called also capital, bonded, long-term, and funded liabilities or debts, comprise all debts of which the date of maturity is some distance ahead and considerably longer than that of current liabilities. Government regulating boards, for purposes of standardization, may set a minimum life-period for this group of liabilities and any kind of debt falling within the period is so classified. Thus, the Public Service Commission for the First District of the State of New York says: “Funded debt comprises all debt which by the terms of its creation does not mature until more than one year after date of creation.” Private undertakings do not need such exact uniformity. Any debt the maturity of which extends beyond the period adopted within that business for current liabilities will usually be grouped with the fixed liabilities, there seldom being an intermediate group.

Purpose of Fixed Liabilities

Fixed liabilities, as distinguished from current, are those issued distinctively for the purpose of raising capital. Due to insufficient original capitalization, funds may be needed for one or more of many purposes. Working capital may be required; extensions of plant and market may be desirable; additional equipment and improvement within the plant itself may be advisable; the control of the plant of a competitor may prove advantageous; it may be deemed wise to fund floating liabilities; the refunding of liabilities soon to mature may become necessary; the financial policy may dictate the unification of several diverse forms of debt—these and other purposes may be served by the assumption of long-term debts.

Corporation Bonds

The most common type of fixed liability is the bond. As an instrument of credit the bond is limited almost exclusively to corporations. The purchasing public, interested in securities of this kind, looks with suspicion on a long-term promise to pay issued by either a single proprietor or by a partnership. Such businesses are almost wholly dependent on the health and ability of individual owners. During a long period of years so many contingencies may arise and seriously cripple the business that the long-term debts of a partnership or sole ownership have no market, although isolated instances of such issues exist. The corporation, however, has continuity of life, is not so dependent on individuals, and therefore has avenues for the raising of funds open to it which are closed to other types of organization.

Nature of Bonds

A bond may be defined as an instrument under seal promising to pay a certain amount of money at a definite or determinable future time. From a legal standpoint, a bond is a contract setting forth the terms and conditions under which the obligation is assumed. Furthermore, it is a negotiable contract transferable from hand to hand, though in some cases registration is necessary to prove ownership in the eyes of the issuing corporation. From a financial standpoint, a bond is essentially a long-term promissory note. Bonds, as here used, are to be distinguished from the old real estate bond and mortgage. Bonds are usually secured by a lien on some definite property or prospect of property, just as the real estate bond and mortgage. The corporation bond, however, is a separate instrument, divisible into small parts, whereas the bond and mortgage is not usually an instrument of that type.

Corporation bonds are also to be distinguished from the surety bonds mentioned in the preceding chapter. These latter, as already noted, are instruments whereby individuals, firms, or corporations bind themselves as guarantors for the conduct of others or for the payment of sums of money for which the guarantor is not directly liable.

Difference between Bond and Real Estate Mortgages

With regard to the mortgage covering the bond issue, points of difference from the ordinary real estate mortgage are to be noted. To the ordinary mortgage there are two parties, viz., the party obligated and the party accommodated, the obligor and obligee. To the bond mortgage, the obligee is a trustee standing in the stead of the numerous bondholders who could not conveniently act individually. In this trustee the title to the property liened is vested for the benefit of the bondholders. The mortgage instrument itself is often a model of completeness and comprehensiveness, defining with minute care the relations, duties, rights, interests, and status of the issuing corporation, the bondholders, and the trustee under present circumstances and all possible future

contingencies.

Kinds of Corporation Bonds

Since bonds were first issued, perhaps one hundred different kinds have been placed on the market. They all have the same fundamental characteristics but differ in minor particulars. No universally recognized basis exists for their classification, nor is such a basis possible, the use which they are to serve determining always the basis of analysis into classes. Thus, in the opinion of a leading authority[50] on the subject bonds may be classified under the following heads, according to:

1. The character of the issuing corporation under which are treated: (a) Civil Loans (b) Corporation loans

2. The security of the bonds under which come: (a) First mortgage (second, third, etc.) (b) General mortgage (c) Divisional (d) Guaranteed (e) Collateral trust (f) Debenture (g) Income (h) Land grant (i) Real estate (j) Prior lien (k) Consolidated (consols) Etc., etc., there seemingly being no limit to the descriptive titles that may be used in order to indicate some feature of the security.

3. The purpose of the issue, as: (a) Improvement (b) Construction (c) Refunding (d) Purchase money (e) Unified (f) Subsidy Etc.

4. The conditions incident upon payment of principal and interest, as:

For the payment of interest— (a) Income (b) Participating (c) Unconditional (d) Registered (e) Registered coupon (f) Coupon (g) Interchangeable Etc.

For the payment of the principal— (a) Premium (b) Gold (c) Silver (d) Straight (e) Serial (f) Extended (g) Callable (h) Optional (i) Convertible Etc.

[50] “The Principles of Bond Investment,” by Lawrence Chamberlain.

The issuing corporation often distinguishes its bonds by means of some descriptive adjectives purporting to classify them or indicate their nature. Thus, consolidated first and improvement, general and refunding mortgage, first mortgage extension, general lien railway and land grant, are titles sometimes met, though a simpler title carrying also the interest rate is more common, as general mortgage 4’s of 1965, C. & A. 5’s, Toledo Light & Power 4’s, etc. As listed on the exchange the title usually gives the name of the issuing corporation (i.e., the obligor), the distinctive name of the bond, and its interest rate.

Bonds rank very much as mortgages do in the priority of their liens. A first mortgage bond has a first lien on the property securing it; a second mortgage bond has a second lien and its claim is said to be junior to that of the first. No attempt can here be made to explain the distinguishing features of the above-named issues. Attention is called to them only because the reader of a balance sheet—an investor or prospective creditor—often must have a knowledge of the various classes of bonds and a detailed knowledge of the conditions of particular issues. It is obvious that the accountant should have a knowledge of the particular issues of a business in order intelligently to draw up a balance sheet and make a report thereon.

Authority for the Issue of Bonds

A corporation has generally a charter right to issue bonds for the purpose of securing money, acquiring property, or in payment for labor or financial services rendered. The exercise of this right may be curtailed by, or be dependent upon, authority from a regulating body. Within the corporation itself, the right to issue vests in the stockholders. In some cases a majority vote suffices; in others as many as three-quarters of the votes may be required to authorize the issue. The directors themselves may, upon proper authorization from the stockholders, make the actual issue, and usually the initiative for a bond issue comes from them because they have intimate knowledge of the business and its needs.

Financial Considerations Involved in Issue

Financial considerations involved in the determination to issue bonds may be reviewed briefly. It is interesting to note that the bond has been used very extensively as a means of securing capital. There is, however, no necessary relationship between the amount of capital raised by stock issues and that raised by bond issues. The sale of additional stock or of bonds or other similar securities is the main source of corporation funds for capital purposes. Some concerns have obtained approximately one-half of their capital through the issue of bonds. Percentages of capital so raised ranging from 15% to 40% are not uncommon.

The manner of raising capital is largely a matter of credit, expediency, and the question of fixed operating expenses. It rarely happens that bonds carry with them the privilege of voice in the management of the corporation's affairs; that is usually limited strictly to the shareholders. Accordingly, the issue of bonds instead of additional stock does not interfere with the management or control of the concern—so long as the contract requirements of the bond issue are adhered to.

Because of the definiteness of the income on bonds and usually the greater security of the principal, bonds may often find a market where stocks would not. On the other hand, if the stock can be marketed as advantageously as the bonds, no definite dividend rate is necessarily attached to them. The price at which stocks may be marketed, aside from the features of extra inducement which might influence the market, depends largely upon the prospective income rate judged mostly by what the company has been able to do in the past and any features of present condition or expected future condition which might influence the earning capacity of the corporation. Therefore, unless a dividend rate a little higher than the current interest rate is in prospect, the company usually finds it difficult to market its stock advantageously.

Bonds versus Stock Issues

The bond market furnishes opportunity for investment to quite a different class of people from those interested in stocks. Security, conservatism, and a definite income are the main elements desired. Thus conditions may oftentimes be such that one market or another may be more favorable for absorbing an issue of securities, dependent on conditions in that market as much as on the credit and standing of the issuing corporation.

Aside from these points which are usually given consideration, is the question of how heavy are the fixed charges the corporation can carry. While from the investor's viewpoint an income at a fixed rate is highly desirable, from the corporation's point of view it may impose so great a burden as to eat up all the profits. The bond interest constitutes a fixed charge deductible before the determination of profits. In case of failure to meet the bond interest, the mortgage covering the bonds is subject to foreclosure. Upon foreclosure at forced sale values always shrink greatly, oftentimes the shareholders lose their entire interest in the company, and all the net assets may be taken to satisfy the claims of the bondholders. As compared with an additional issue of stock—common or preference shares, as may best meet the situation—a bond issue may thus be of doubtful value. One of the knotty problems upon a reorganization following insolvency is that of lowering the fixed charges by converting some of the bond issues into preferred stocks in order to prevent the recurrence of operation at a loss and so of inability to meet bond interest.

Accounting for Bond Issue

Accounting for the bond issue presents much the same problems as those connected with an issue of stock. Inasmuch as most corporation issues are sold in block to a banker who in turn markets them to the investing public, often through a syndicate (or the process may be one of under-writing), there is usually no need for detailed subscription records and accounts. In the case of coupon bonds no record of individual ownership is required because the bonds pass by delivery, possession evidencing ownership and the interest coupon being payable to bearer. In the case of registered bonds, a record of individual holdings must be kept similar to the record of stockholders. The party in whose name the bond is registered on the company's records is the prima facie owner to whom the periodic interest check is also sent. If the bond is registered as to principal but bears coupons for the interest, records of individual ownership are also required here.

Entry of Issue on Books

Placing the bond issue on the books is accomplished by either of two methods. Assuming an issue of $500,000 of first mortgage 5% bonds of which $350,000 are sold at par for cash, the balance remaining unissued for the present, the entries would be:

First Method

(1) Unissued First Mortgage Bonds $500,000.00 First Mortgage Bonds Payable $500,000.00

(2) Cash 350,000.00 Unissued First Mortgage Bonds 350,000.00

Entry (1) is used to make a memorandum entry of the authorized issue. Entry (2) shows the amount sold for cash. The balance in the Unissued Bond account is treated as an offset to the Bonds Payable account. Sometimes the title "Treasury Bonds" is used instead of "Unissued," but the term is apt to be misleading because of the restricted meaning given the word in connection with treasury stock.

Second Method

(3) Cash $350,000.00 First Mortgage Bonds Payable $350,000.00

Under the second method, the desired information as to authorized issue would be carried parenthetically in the account title. At the present time the tendency is to deprecate an unnecessary multiplication of accounts as is brought about through the use of memorandum accounts. The second method is therefore the preferred method and in its operation brings onto the books the same information as the first method.

Entry of Premium or Discount on Books

Bringing the bond premium or discount onto the books is accomplished in the same manner as for stock. Thus, using the above data and assuming $100,000 of the bonds sold at 101 and the remaining $50,000 at 99¾, the entries would be, illustrating only the second method:

(4) Cash $101,000.00 First Mortgage Bonds Payable $100,000.00 Premium on First Mortgage Bonds Payable 1,000.00

(5) Cash 99,750.00 Discount on First Mortgage Bonds Payable 250.00 First Mortgage Bonds Payable 100,000.00

Subsequent handling of the premium and discount accounts will be shown on page 368.

Bonds may be issued for cash or property, as in the case of stock. Unless there is evidence to the contrary, when bonds are issued for property they are brought onto the books at par value, the courts holding here as with stock that the parties to the transaction (usually the corporation's directors) are in a better position to judge the value of the property taken over than anyone else. This oftentimes results in an inflation of property values—an injection of water—and should not be countenanced where a true basis for determining the value of the bond is offered. Thus, if almost simultaneously with the issue of the bonds for property, some are sold for cash, the cash price received would usually be a fair basis for booking the premium or discount on those issued for property. The sale for cash must be a bona fide sale in the open market if it is to represent the market's judgment of the offering. Sometimes an objection is raised to a Bond Discount account appearing on the books; hence the practice, wherever possible, of charging the discount against some asset account as a part of the cost of that asset. When the true nature of bond discount or premium in its relation to the periodic interest charge is appreciated, the objection has no weight.

Entry of Interest Payments on Books

Booking the payment of the periodic interest is accomplished by a charge to Bond Interest and a credit to Cash. This interest should never be entered in the regular Interest and Discount account. If the bonds are coupon bonds with the coupons redeemable through a designated trust company, a check for the full amount of the interest on the outstanding bonds should be issued and booked as above. If the coupons are redeemable at the company's office, an entry debiting Bond Interest and crediting Coupons Payable should be made, to record the interest charge and the liability therefor. As the coupons are redeemed, Coupons Payable is charged and Cash credited, any balance remaining in Coupons Payable account representing the liability existing because of coupons not yet presented for redemption. In the case of bonds registered both as to principal and interest, the interest checks made payable to the registered parties constitute a charge to Bond Interest and a credit to Cash. It is sometimes advisable to transfer by one check the total bond interest payable to a special bank account and issue the individual interest checks against this fund. Whenever the books are closed it is always necessary, unless the end of the fiscal period coincides with the bond interest date, to take account of the accrued bond interest as on that date. The adjusting entry here is similar to that for any accrued expense.

Relation of Bond Interest to Premium or Discount

The main problem in connection with accounting for bond interest is that of the relation between bond premium or discount and the periodic bond interest. At practically any time in the market there is a rate at which the bonds could be sold at par. This rate is known as the effective rate. If a company puts an issue of bonds on the market at a higher rate than this, the market will offer a premium for them. The amount of the premium will be, theoretically, the present value of the periodic sum represented by the difference between the stated bond interest and the effective interest, these periodic payments extending over the life of the bond. In other words, the premium represents the price paid to buy the additional interest, dollar for dollar, on a compound interest basis. The premium is therefore not an earning, an item of income, but is an offset to the excess bond interest. The portion of it applicable

to each period represents the excess interest which deducted from the bond interest shows the real or effective cost of the money borrowed and to be paid back. Thus, the bond interest rate based on the money actually received, i.e., par plus premium, is exactly the same as the market or effective rate on par. In other words, the corporation is paying for its actual borrowings simply the current market rate of interest.

It is therefore incorrect to show on the books the cost of the loan at any other figure than the effective interest. The actual periodic payment of interest is, however, at the bond interest rate. This must be brought down to the effective rate by application to it of a portion of the premium which represents the sum paid for the privilege of receiving the higher rate of interest. Similarly, bonds are marketed at a discount when the bond interest rate is lower than the market rate prevailing on similar security at the time the bonds are floated. This may be looked upon as a payment by the company in lump sum to compensate a purchaser for the difference in the income on the bond and what he might obtain on the open market. The discount should be applied, therefore, periodically to bring the cost of the loan up to its true figure, viz., the market or effective rate. An illustration will clarify the points of the above discussion.

Example of True Interest Cost

Assume a 7% bond, interest every six months, payable in 25 years (50 periods), par $1,000, sold in a market whose prevailing interest rate is 6%. By the method developed on page 273, the value of such a bond is found to be $1,128.6488, the premium being $128.6488. At the effective rate the real cost to the issuing company is 3% on $1,128.6488, or $33.8595. The actual sum paid as interest is $35, i.e., 3½% on $1,000. The difference between the effective and actual bond interest, or $1.1405, is the portion of the premium to be used that period in order to reduce the amount of actual interest paid to the real or effective cost of the loan. The bookkeeping entries are:

(6) Bond Interest $35.00 Cash $35.00

(7) Premium on Bonds 1.14 Bond Interest 1.14

Similar calculations and entries for each of the succeeding 49 periods would be made, the application of the effective rate always being, of course, to the amortized value of the bond as on that date. This process is called scientific amortization of the premium (or discount) of the bond. Its effect is readily seen to be to spread over the life of the bond the premium (or discount) and so not to take credit for it in a lump sum during the period in which the bond is matured. There are four cases to which this principle of showing the true interest cost is applicable, as follows:

1. A bond sold at a premium to be redeemed at par on maturity. 2. A bond sold at a discount to be redeemed at par on maturity. 3. A bond sold at a discount to be redeemed at a premium on maturity. 4. A bond sold at par to be redeemed at a premium on maturity.

At the close of a fiscal period which does not coincide with the bond interest period, not only must the bond interest accrued to date be shown as an accrued expense, but also there must be so shown the portion of the premium (or discount) accrued to that date required to bring the bond interest cost down to the effective basis.

Presentation on Balance Sheet

The final problem in connection with bonds concerns the manner of their showing on the balance sheet. That has perhaps been sufficiently indicated. The amount of the authorized issue should be short-extended, and the amount unissued subtracted therefrom with the net amount outstanding full-extended as the significant figure in the balance sheet.

Other Fixed Liabilities

Real Estate Mortgages. Another item among the fixed liabilities is the simple real estate mortgage. This is usually called a bond and mortgage, the bond being simply the promise to pay and the mortgage being the security for the amount of money borrowed. In some states the more formal document called the bond is used as a contract according to which a named sum is to be paid in case the amount borrowed on the mortgage is not paid. This named sum is usually the amount borrowed, although in some states it is twice this amount. In booking a note or bond supported by a mortgage, the customary title is “Mortgage Payable” rather than “Notes Payable” which is generally understood to be applicable in the main to current liabilities. In case the double amount is named in the bond, it is not customary to take cognizance of the contingent liability thereunder.

Loans on Collateral. Short-time loans are frequently made on collateral security. Stocks and bonds, particularly of the borrowing company or its subsidiaries, may also be made the basis of a long-time loan. This may take the form of a bond issue, promissory notes, or other similar obligations. Accounting for the loan and its showing on the balance sheet follow the principles already laid down. The title of the loan account should carry the word “Collateral” or other similar term to show its nature. Accounting for the collateral is usually accomplished by a memorandum in the stocks, bonds, or investments account to show exactly what securities have been withdrawn for deposit as collateral. No further record is needed other than a complete list of such securities; the securities are still owned by the company, though deposited under a conditional contract with someone else. If the loan is dishonored at maturity and the securities are sold in satisfaction thereof, the necessary entries must be made to show the sale of the securities, the profit or loss attendant thereupon, and the repayment of the loan. In showing the pledged securities on the balance sheet, it is well to present the securities in two groups or classes, viz., those pledged as collateral for the loan shown contra and those not so pledged.

Short-Term Securities. When the market is not favorable to the issue of long-term securities, because of the high rate of return demanded by investors, corporations often have recourse in their borrowings to short-term securities—usually note issues with maturities ranging from one to five years, two- and three-year terms being the commonest. The financial consideration in their issue is merely a speculation that by the time of their maturity the market will be more favorable for the flotation of long-term securities. Thus the company hopes at the maturity of the notes to free itself from the need of paying so high an interest rate as it is required to pay now for the short-term securities. These notes may be in different denominations and are accounted for just as other notes. On the balance sheet they are grouped with the fixed liabilities until within a short time of maturity, when they must be shown with the other current items.

CHAPTER XXI

CAPITAL STOCK AND ITS VALUATION

Problems in Valuation

The problems in connection with the valuation of the assets and the liabilities and the manner of showing them on the balance sheet—and in some cases the manner of booking them—have been treated in some detail in the preceding chapters. It might seem that, inasmuch as proprietorship or net worth is determined always by the excess of assets over liabilities, no question would arise concerning the valuation of net worth, its value being automatically determined by whatever values are placed on assets and liabilities. That its value is so determined, that every change in net worth must be reflected in the assets and liabilities, does not admit of argument. There are, however, certain phases of the question of valuation and certain problems connected with it, that, because of their close connection with net worth or their direct effect upon it, are best treated under this head rather than under the head of each particular asset that may be affected. Thus, if treated among the assets, the valuation of properties purchased with stock would require, under the head of each asset which might be so acquired, an almost identical statement of principle. For this reason, some problems in valuation have been reserved for treatment here in connection with capital stock.

In addition, there are related problems which concern the surplus and reserves. It is true, these all have their origin in the general considerations of valuation as given for the assets and liabilities. But questions as to what constitutes a profit, whether all profits are applicable to dividends, the proper treatment of capital profits, the relation of capital losses to profits and dividends, the differentiation of the classes of reserves, and finally the manner of showing and explaining the periodic changes in net worth by means of the supplementary statement of profit and loss—all these and other similar questions are closely related to the problem of valuation and, as indicative of the financial policy of a business, may directly affect all going concern values. On this account they require separate treatment from that of any individual assets and liabilities or group of assets and liabilities. Accordingly, the next few chapters will be concerned with these problems and any others which are relevant thereto.

Kinds of Stock

Capital stock is of various kinds—that with a stated par value and that without, common stock, various kinds of preference shares, debenture stock, guaranteed stock, founders’ stock, convertible stock, and redeemable stock. The student is referred to Chapter I where these various kinds of stock are discussed.

Par, Real, and Market Values

Capital stock may have several kinds of value, as the term value is used. All stock is expressed as so much per share. The value mentioned as the stated value of a share of stock in the contract of issue is known as the par, face, or nominal value.

The book value of stock is the value of the stock, as shown by the books—not the amount carried in the stock accounts, but the entire net worth of the corporation divided by the number of shares outstanding. Thus, if the assets minus the liabilities—the net assets—of a corporation amount to $1,500,000, of which $1,000,000 represents 10,000 shares of stock of par value $100, and the $500,000 is surplus, the book value of the stock is said to be $150 per share. From the standpoint of a going concern, this value is also spoken of as the real value in the sense that it is represented, dollar for dollar, by actual assets held by the corporation. Real value is also used to mean liquidation value, the value which the net assets upon forced or voluntary sale would realize for distribution to each shareholder.

Finally, there is the market value of stock by which is meant the value placed on it in the stock market or wherever stocks are dealt in. This value depends primarily upon the dividend-earning capacity of the stock, although many side issues of fact and opinion affect it. Thus, not only present, but past as well as prospective future dividends influence the market. At times, particularly in a declining market, the financial needs of the holders of the stock may affect prices more than the dividend rate of the stock.

The problem of stock valuation as related to the commercial balance sheet takes cognizance of only one of these values, viz., par value, though each of the others is related to and measured by the showing of values on the balance sheet. That par value is not always the true value cannot be controverted. As already shown, the inclusion on the balance sheet of assets of doubtful value is allowed when the doubtfulness of their value is generally recognized and no one is thereby misled. Some problems in connection with stock values and their inflation on the books will now be discussed.

Value Dependent upon Earning Capacity

Upon the inception of an enterprise the problem of stock valuation is always bound up with the question of valuation of the assets and liabilities, as pointed out above. When the asset to be valued is only cash, the problem is not usually difficult, as where the capital stock is sold for cash. Where, however, the sale is for a property taken over, the valuation of the stock is related to the larger problems of capitalization, with which in turn the valuation of the assets is bound up. It seems best, therefore, for an intelligent understanding of the question to review briefly some of the bases of capitalization.

As indicated above, the market value of any stock is dependent in the long run more on the factor of its earning capacity than anything else. If investment in a stock nets the prevailing income rate on money, that stock will approximate its par value. So when determining the capitalization of a company which expects to be taken over as a going concern, the main consideration is not so much its true valuation as it is its earning capacity and its ability to pay dividends. Thus, if on a cost basis the net values taken over amount to $250,000, but past performance and future expectation reasonably indicate a capacity to earn a normal dividend on $1,000,000, it is very probable that the new company will capitalize at $1,000,000. If this sum is actually and in good faith paid, little or no exception can be taken to recording the value of the plant taken over at $1,000,000. The transaction is the result of a bargain. The additional value over cost may, in the estimate of the purchaser, represent the true value of the good-will or other intangible assets acquired but not included in the $250,000 referred to above. In a bargain transaction such as the foregoing, judgment of value is sometimes wrong; but the buyer can only show the property bought at what it cost him at the date of the purchase—whether the payment is in cash, stock of a stated par value, or other assets.

Increase of Book Capitalization

If, however, the transaction is merely a reorganization of the old company by its owners solely for the purpose of increasing its book capitalization by bringing onto the books an existent good-will or by other means of inflation of assets, the result is a so-called watering of the stock. The propriety or impropriety of this is chiefly a question of business ethics, and its discussion is beyond the limits and the purpose of this volume. It may be said here, in passing, that under certain conditions the practice may be entirely proper and no inequities may result. On the other hand, the purpose of such a reorganization may be fraudulent, in which case it frequently works hardship and injustice. The main accounting problem involved when the book capitalization of a concern is increased is the method of recording the transaction, so that the true status of affairs will appear unmistakably and any attempted fraud will be shown.

Capitalization on Cost

Opposed to the basis of capitalization on earning power is that of capitalization on cost. In a case of capitalization it is very difficult to know exactly what is meant by cost, as there are so many kinds of cost. There is original cost; original cost less depreciation; present cost new of an identical property, i.e., reproduction new cost; reproduction cost less depreciation, etc. In this discussion original cost is taken as the basis, less depreciation, or such cost plus a bona fide payment for good-will or for the privilege of securing an established business. All these other factors may and frequently do enter into the determination of a bargain and sale price and therefore affect capitalization.

The regulation of the Public Service Commission of the First District, State of New York, concerning the manner of keeping the capital stock accounts of public service corporations, is as follows: “To the account for any class of stocks shall be credited when issued the par value of the amount of stock of that class issued. If such issue is for money, that fact shall be stated; and if for any other consideration than money, the person to whom issued shall be designated and the consideration for which issued shall be described with sufficient particularity to identify it; if such issue is to the treasurer, or other agent of the corporation, to be by him disposed of for the benefit of the corporation, that fact and the name of such agent shall be shown; and such agent shall in his account of the disposition thereof show the like details concerning the consideration realized thereon, which account when accepted by the corporation shall be preserved as a corporate record. If the fair cash value of the consideration realized upon the issue of any amount of stock is greater than the par value of such stock, the excess shall be credited to the account ‘Premiums on Stocks’ and the corresponding reference thereto shall be contained in the entry relating to such stock in the stock account.”

The Law and Stock Issues

Thus, it is seen that the state takes cognizance of financial arrangements and methods of accounting in some of those particulars wherein the state is vitally interested. These regulatory provisions are usually found in the corporation laws of the state or amendments thereto. At the present time there are at least three types of such laws:

Under one type it is provided that, when property is taken by the corporation in payment of its shares, the incorporators alone are the judges of the values of such property and that the state’s only duty is to prevent fraud. Fraud must be shown by the injured party and usually the facts by which this might be established are hidden in records to which a stockholder has no access. The remedy is against the directors personally. This type of corporation law is found in most of the states.

Under the second type active control of the issue of stock is undertaken by the state. This requires an independent appraisal and valuation by the state’s experts. This type of law is found frequently governing the incorporation of public utility companies. It is based on a paternalistic theory of state functions not yet recognized as applicable to private undertakings.

Under the third type, we find the law authorizing the capitalization of any and all kinds of property—in the absence of fraud, of course—provided that a full statement is put on record showing the amount of stock and the exact manner in which it is paid for. The amount of cash received must be shown; the property acquired so labeled as to render identification possible; and any payments for services or other expenses must be shown. The attitude taken is that a prospective investor, provided with these facts about the company, can make his own judgment as to stock values.

Thus, we find that practice is not uniform in these regards. From the viewpoint of theory, any accounting treatment of the issue of stock which shows the full facts with regard thereto may be considered as meeting all reasonable requirements.

Treatment of Discount or Premium

Valuing capital stock when issued for cash presents no problem in itself, but the treatment of the discount or premium incident thereto requires consideration. In most of the states and in Great Britain stock cannot be issued below par. The manner of nullifying this provision has already been referred to in Chapter I. There it was shown how the issue of fully paid stock is made for property and how treasury stock is created by donation, which may then be disposed of for any price obtainable, without any additional liability attaching to it. In most of the states and in Great Britain, however, a sales commission is allowed which has, in some instances, been used as a cloak for sales at a discount. The booking of the discount or premium presents no difficulties, but the manner of handling it on the balance sheet is not uniform. Premium or discount on stock should be recorded as such on the books, under titles of definite meaning.

One occasionally hears the argument that the discount on stock is a necessary expense incident to financing the company, a sort of “cost of getting started,” an expense without which the enterprise could not be launched; accordingly the discount should be

properly capitalized as a part of the property costs. The argument is plausible but not convincing. The information as to the discount on stock is very necessary to the prospective creditor or investor and should always appear as a separate item on the books. To the same effect is the ruling of the Interstate Commerce Commission that premiums on capital stock must be carried on the book permanently unless offset by discounts later allowed. Discounts may be extinguished by premiums, assessments, surplus, or by the retirement of an equivalent amount of stock.

A premium on stock may be looked upon as similar to a capital surplus. It represents a fund of capital originating upon the inception of an enterprise, and is in no sense an increase of capital, i.e., of net worth, due to operation. So far as the law is concerned, there is nothing to prevent the return of this surplus to the shareholders in the form of a dividend. To treat it as available for ordinary dividends, however, would seem not to be in keeping with the manner of its origin. Rather should it be set aside as a permanent surplus. One requirement in the case of national banks is the creation of a permanent surplus equal to 20% of the capital, and so, frequently the original subscribers agree to take their stock at a 20% premium, this premium providing the legal surplus required. In the case of discounts no accounting principles are violated if they are allowed to remain on the books. If there is a surplus from premiums, that should be used to wipe off any discounts. In the absence of premium or other capital surplus, conservatism usually sanctions the use of operating surplus for this purpose, thus bringing the value of the net properties owned at least into equivalence with the par value of the stock.

Valuation of Stock Issued for Property

The difficulty of valuing stock when issued for property has already been stated and the attitude of the laws towards any valuation placed on the properties taken over has been shown. Nothing further here need be said except to state that where also a bona fide sale of a portion of the stock takes place for cash at the same time, a fairly reliable basis for valuing the stock given for the property is offered. It is not the usual practice to show the probable discount on the stock, although such treatment would be logical and consistent with the facts. A similar valuation of the stock might be secured by an independent appraisal of the properties taken over, but this, if done, is not often made the basis for entry on the books. If all the facts are fully recorded, that probably is as much as can be hoped for under the conditions now prevailing. Undoubtedly the use of no par value stock for incorporations of this kind offers the best solution of the problem. With regard to booking the properties acquired by a stock issue, attention is here called to the method of valuation of the individual units by an appraisal committee usually appointed from among the directors and the use of their findings as the basis for the book entries of the transaction.

Valuation of Treasury Stock

In connection with the purchase of properties by stock, there often arises the need of working capital. This is frequently furnished by the pro rata donation or return of some of the stock to the corporation, the sale of which furnishes the necessary working funds. As illustrated in an earlier chapter this donation is booked at the par value of the stock, the charge being to Treasury Stock and the credit to Donated Surplus, Donated Working Capital, or other similar account. Being true treasury stock, it can be sold at any price without liability. It is usually disposed of at a discount which must be recorded on the books either as a charge to Discount on Treasury Stock account which will later be closed against Donated Surplus or as a charge direct to Donated Surplus. Thus when the treasury stock is all disposed of, the net credit balance in Donated Surplus shows the real amount of working capital obtained through the donation. If not entirely sold, the portion sold gives a fair basis for the valuation of the unsold portion, although this value is seldom brought onto the books, it being used as a guide to financing rather than as an item to be regarded in accounting valuation.

Redemption and Reduction of Capital Stock

The redemption and reduction of capital stock presents a problem of surplus adjustment requiring careful treatment. If a corporation has accumulated no surplus of any sort and redemption of the stock is at par, no difficulty is met in making the entry. If, however, a surplus has been accumulated and redemption is either above or below par, care must be exercised to record the transaction properly. Redemption at a stated price is sometimes one feature of a preferred stock issue. Again the stock may be bought in the open market for the purpose of cancellation. Reduction of capital, except when made a condition of the original issue, cannot usually be accomplished without the consent of at least a majority of the shareholders and authorization from the state. For the sake of simplicity, assume just one class of stock and a surplus in which each share has an equal interest. If redemption is at par, the surplus is evidently not affected but each share of stock remaining outstanding has a larger share in the surplus and so acquires a higher book value.

Redemption of a stock at its _book_ value is accomplished by charging capital stock for its par value and surplus for its pro rata share in the surplus, the offsetting credit to both these being to cash. The value of the remaining shares of stock has not been affected in the least. If redemption is at any other figure than book value, not only is surplus affected, being increased if the redemption price is below par and decreased if above par, but also the value of the remaining shares. In the case of different classes of stocks, a careful determination of their respectively equitable shares in surplus would have to be made before the effect on the remaining shares could be calculated.

In passing from the question of stock values, it should be pointed out that an undervaluation of stock when issued for property, though seldom seen in practice, has the refreshing effect of creating a secret reserve. That is, property values are carried on the books below their actual values and a secret reserve is thereby created. A further discussion of secret reserves will follow in a later chapter.

Dividend Stock

Stock is sometimes issued for dividend purposes. In such cases, it is always issued as of par value. If profits have been earned or a surplus accumulated out of which a dividend may be declared, that dividend may be paid in any way the corporation sees fit. Payment may be made in cash, scrip, or in the shares of the company. If the corporation has neither unissued stock nor stock in the treasury, permission to increase its capitalization must be secured before a stock dividend can be paid. Some corporations, notably financial institutions, often make it a matter of policy to accumulate a large surplus and then distribute it by means of a stock dividend. Declaration of the dividend is made and recorded as usual. Record of the payment in stock is made as a debit to Dividends account and a credit to Capital Stock.

The effect of a stock dividend is twofold. From the point of view of the management of the surplus it has the effect of a permanent investment of the surplus in the business. Thus it places the accumulated profits beyond the control of any future board of directors. If left in surplus, a cash dividend might have been declared and the asset dissipated to that extent. The stock dividend, however, keeps the profits invested in the business in such a way as not hereafter to be available for dividends. From the point of view of the stockholder, upon the declaration of a stock dividend his equity, his proprietorship in the business, is not in the least affected excepting that it is divided into more parts; he has more shares to represent it than he had before. Before he possessed as a community right a pro rata share in the surplus. Now the ownership of that share has become personal, individual. Each share of ownership thus has a smaller book value but each stockholder’s equity is the same as before.

Stock Issued as a Bonus

The manner of recording stock issued as a bonus with bonds or for any other purpose has been illustrated in an earlier chapter. Here, attention is called to the effect of such an issue in states where stock cannot be sold below par. There is no legal bar to the sale of bonds below par. If, then, the price received for the bond carrying a bonus of stock is at least equal to the par value of the bonus stock, there is nothing extra legal in the transaction. However, record must be made of the issue of the stock at par, the discount or bonus being carried as applying to the bond.

The valuation of stock issued in effecting combinations or for labor or services follows along the same general principles as of that issued for property, and the same general considerations are pertinent.

Unissued and Treasury Stock on the Balance Sheet

When showing capital stock on the balance sheet, it is best to treat unissued and treasury stock as valuation items. The reason for this was stated and discussed in Chapter XIV. Here the relevancy of showing the unissued stock will be considered, as a statement of the outstanding stock is thought by some to be all that is required. It has been argued that the unissued stock does not in any sense represent an asset nor does it show proprietorship. Why not, therefore, leave it off the balance sheet statement entirely? It is true that an investor, a creditor, or a stockholder is interested in the main only in the condition of the business as shown by its present assets and liabilities. Unissued stock has no value till placed on the market; all that it shows is that certain legal requirements have been met authorizing its issue and to that extent it has a contingent value which may become a real source of capital to the corporation if additional funds become necessary. While, therefore, the omission of the item entirely from the balance sheet does not affect present conditions, it is considered best, in the interest of full information as to the exact status of the company, to show the amount of the authorized capital with the amount unissued extended short on the balance sheet, the

difference being the amount outstanding—which is full-extended as the significant item, thus:

Capital Stock Authorized $1,000,000.00 Less Amount Unissued 250,000.00 ---------- Amount Outstanding $750,000.00

A similar showing of the treasury stock is also considered best, although good authority can be found for its inclusion among the assets.

Preferred Stock Covered by Redemption Contract

On the border line between liabilities and proprietorship is preferred stock covered by an unfulfilled redemption contract. Such stock is issued with a definite redemption contract to become effective at stated dates, and is manifestly different from preferred stock redeemable upon call at any time _after_ a named date. In the latter case the option of redemption is with the company, whereas in the former case the company binds itself to a contract enforceable at a definitely stated time. From the financial standpoint the wisdom of a company binding itself to a contract enforceable some time in the future may be open to question because of the inability at the time of issue to foretell the company's condition at the time of redemption; although in this respect the condition is practically the same as that confronting a company at the time of a bond issue. There is this marked difference, however: A bond issue is always a liability and continues as such after maturity; but in the case of a stock redeemable at a given date, the point at issue is whether the failure of the company to redeem automatically changes the status of the owner of the stock from that of a proprietor to that of an outside creditor.

"For instance, a corporation sold $750,000 of first preferred stock, with a provision for the retirement of $150,000 annually after a certain period had elapsed. When the first instalment became due the corporation was unable to meet its obligation. There was no provision in the certificate bearing on the treatment of the overdue payment in the accounts or the balance sheets. The auditors declined to certify the balance sheet until a decision was reached as to whether or not the amount represented a liability to be liquidated as soon as funds were available. So long as this possibility existed the position of the general creditors was subject to change. Finally it was decided to secure an extension from all stockholders and upon satisfactory evidences thereof the auditors passed the balance sheet.

"No general rule can be laid down for the auditor's guidance in such cases as this, as each case must be decided on its merits. The most important facts for the auditor to ascertain are the rights of stockholders to insist upon payment, and the aggregates and due dates of all probable obligations. Their disposition in the accounts is then a matter of disclosing full information to creditors, prospective creditors, and to other stockholders."[51]

[51] Montgomery's "Auditing, Theory and Practice."

CHAPTER XXII

PROFITS

Difficulty of Determining Profits

What constitutes a profit is oftentimes a perplexing question and at all times its determination is more an estimate than an absolute fact. This arises from the nature of accounting itself in that so many items of expense are known to exist and must accordingly be provided for but the amount of such expenses cannot be exactly determined. This is seen to be true in the case of the provision which must be made for bad and doubtful accounts and for depreciation of fixed assets and is, of course, inherent in all problems of valuation. As is proverbially true of the prescriptions of different physicians for the same malady, so no two accountants would arrive at the same figure of profit for any given concern.

Economic Definition

It may be of some advantage at this point to attempt a definition of profits although to compress the meaning of the word within defined limits is hardly possible and for this reason the formulation of a working definition is very difficult. Etymologically, "profit" comes from the Latin word _proficere_, meaning to make progress, and a better definition than this would be difficult to find. At the best the term is an elusive one, being used with slightly different connotations in different schools of thought. Thus, we find the word used and defined in economics, law, and accountancy, and some of the definitions are twisted almost to the point of absurdity. Alfred Marshall,[52] the English economist, says: "If a person is engaged in business, he is sure to have to incur certain

outgoings for raw material, the hire of labour, etc. And, in that case, his true or net income is found by deducting from his gross income 'the outgoings that belong to its production.'" Charles S. Devas[53] says: "The income from production combining both labor and capital is profits." He defines gross income as "the total wealth added to the property of a given person in a given time from _whatever_ source ... and net income as gross income minus the following items: (a) Destruction, damage, or loss by fire or other accident, by violence, by thieves, by bad debtors. (b) Using up of materials in production, and wear and tear of machinery and industrial buildings such as factories or shops. (c) All sums spent on purchases of goods that are to serve the purchaser not as subjects of enjoyment, but as means of getting an income. (d) All sums spent on hire of goods that in like manner are to serve as means of getting an income. (e) All payments for labor that in like manner are to serve as means of getting an income." One wonders if Marshall's idea of incomings and outgoings is limited to a cash basis or if he recognizes accruals. On the other hand, from the point of view of accounting, Devas includes too much, as will be pointed out later. E. R. A. Seligman[54] says: "Profits are the income from business enterprise.... Profits are always a surplus. They are the difference between the cost of production or acquisition and the selling price." He summarizes expenses of production as including cost of raw materials, wages, rent, interest on capital borrowed or _invested_, taxes, and miscellaneous outlays such as insurance, advertisements, and transportation expense. Again, he says:[55] "Income is that which comes in to an individual above all necessary expenses of acquisition and which is available for his own consumption." He recognizes depreciation as a necessary expense.

[52] In "Principles of Economics."

[53] In "Political Economy."

[54] In "Principles of Economics."

[55] In "Income Tax."

All of this attests the statement made above that the formulation of a satisfactory working rule for the determination of net profits, from the business standpoint, is extremely difficult. It should be said, of course, that in some respects the idea of net profit as used in economics differs from that used in business; the chief difference being that interest on invested capital is in economics looked upon as an expense deduction before the determination of profits.

Legal Definition

The efforts of the law, as evidenced by court decisions, to mark out definitely the meaning of net profits have resulted in many odd twists of terms and meaning. In an English case[56] decided as recently as 1902, this language is used: "If it is a mere question what were the profits made in a particular year, it seems to me that the duty is to ascertain what cash has been received and what cash has been expended, and, if that is fairly done, you know the profits of the year. If there is a large outstanding liability which cannot be settled, the partners will estimate that, and it will not be considered as part of the profits. If there is a large outstanding possible loss, and there is a large sum due to a client, then you would provide for that. But in ascertaining what is really actually divisible for the year fairly, you would take the cash account as it stands." In the light of such mental obtuseness and obliquity, one cannot wonder at the occasional reluctance of business to entrust the determination of important matters to the courts.

In cheering contrast is a legal opinion quoted by R. H. Montgomery,[57] in the following: "I should think that no commercial man would doubt that this is the right course—that he must not calculate _net profits_ until he has provided for all the ordinary repairs and wear and tear occasioned by his business. That being so, it appears to me you can have no net profits unless this sum has been set aside.... If you had done what you ought to have done, that is, set aside every year the sum necessary to make good the wear and tear in that year, then in the following years you would have a sum sufficient to meet the extra cost." Even here confusion is apparent between a valuation reserve and a reserve which has been funded and the emphasis is rather on the point of providing funds necessary for the purpose—a financial problem as distinguished from an effort to define net profits.

[56] Badham v. Williams.

[57] In "Auditing, Theory and Practice."

Between these extremes of legal opinion and phraseology one finds all shades and degrees of understanding and misunderstanding. In recent years there is evident in the decisions of our higher courts and of our many excellent governmental commissions and bureaus a real appreciation of some of the technical points involved in profits determination. It is believed that a body of authoritative decisions will in time and perhaps soon reflect the best opinion of the business men of the country.

Accounting Definition

The purpose of this chapter is to discuss some of the points at issue in this vexed problem, but before entering upon this discussion it will be of advantage to quote from leading authorities on the attitude of accountants towards the determination of profits.

A. Lowes Dickinson[58] says: “In the widest possible view, profits may be stated as the realized increment in value of the whole amount invested in an undertaking; and, conversely, loss is the realized decrement. Inasmuch, however, as the ultimate realization of the original investment is from the nature of things deferred for a long period of years, during which partial realizations are continually taking place, it becomes necessary to fall back on estimates of value at certain definite periods, and to consider as profit and loss the estimated increase or decrease between any two such periods.” It is in the making of these estimates that the most difficult problems of profits determination are met.

[58] In “Accounting Practice and Procedure.”

Mr. Montgomery in his dictum, “The net profit of a business is the surplus remaining from the earnings after providing for all costs, expenses, and reserves for accrued or probable losses,” offers the best available working definition, although a caution is needed against the danger of relying exclusively upon any one definition.

Methods of Determining Profits

Systems of bookkeeping, in the main, provide two distinct methods for the determination of profits, namely, by means of single entry and double entry. The student is referred to the author’s first volume for the detailed working out of profits by single entry. Here it is sufficient to say that the determination of profits rests upon a comparison of assets and liabilities as at the beginning of a fiscal period, with those as at the end of the period. Then the increase or decrease in net worth as so determined, after making due allowances for any withdrawals or investments of capital during the period, constitutes the figure of net profit or loss for the period. The disadvantages and inaccuracies inherent in this method have already been pointed out.

The method of determining profits by means of double entry provides an entirely distinct set of accounts known as temporary proprietorship or profit and loss accounts. These record the daily changes in net worth and must be summarized through the Profit and Loss account at the close of the fiscal period, at which time they must prove against the profits as determined by the balance sheet, the method of which is essentially the single-entry method. In addition to this control secured by checking the results obtained by one group of accounts against those of another group, is the important advantage of presenting in the record a mass of statistical information for guidance in the conduct of a business, without which the present-day enterprise with its many complexities of organization and working could not hope for any certain measure of success.

The Problem a Question of Valuation

Inasmuch as every profit made must be reflected in a corresponding increase of some asset or the decrease of a liability, and, conversely, every expense incurred is reflected as a decrease of assets or increase of liabilities, it is apparent that profits determination is largely a question of the valuation of assets and liabilities and therefore rests upon the principles already established. Thus the amount of _gross_ profit is not determinable until the value of the stock of merchandise on hand is known. Gross profit rests on inventory valuation, whether that be accomplished by the perpetual inventory method or that of periodic stock-taking. While under the double-entry system the charges for expense are more or less fixed and certain and not so dependent on inventory, it has been seen in Chapters XIV and XIX that before accuracy can be secured, here too there must be an inventory or appraisal to determine the prepaid and accrued expense items. The basis for valuing these was indicated in the chapters referred to. Estimates of depreciation, bad debts, and other similar items must also be made to secure a proper appraisal of the corresponding asset items. Similarly, in the determination of other income, accruals and prepayments must be taken into account. In the making of the record of temporary proprietorship data, the fundamental distinction between capital and revenue charges is vital and must be kept constantly in view.

Thus the problem of profits is seen to be in its broader aspects the same problem of valuation to which attention has already been directed. It is purposed here to point out the application of the valuation problem to the periodic determination of profits and to re-examine some phases of the problem from the standpoint of profits as distinguished from that of assets.

Effect of Asset Losses on Future Profits

The first question for discussion may be stated as follows: In the determination of _periodic_ profits must all the data which have affected proprietorship during that period be summarized in order to make a proper showing of profits for the period? An illustration will better present the issue. A manufacturing concern with plants in many places suffers a heavy loss from fire. Must this loss be considered (1) as an expense applicable to the current period and to be taken account of before the determination of profits for the period; or (2) may it be treated as a deferred expense to be shared by several succeeding periods; or (3) may it be charged directly against capital?

Three somewhat different solutions are thus presented. The first treats the loss as a _temporary_ proprietorship charge; the second as a deferred charge to operation and so includes the portion deferred among the assets and to this extent does not reflect the loss as a diminution of net worth; and the third treats the loss as a charge against _vested_ proprietorship.

Any adequate treatment of the question requires a consideration of (1) the type of business organization, i.e., single proprietorship, partnership, or corporation; (2) the appropriation of profits, whether they are to be withdrawn or reinvested in the business; and (3) the nature of the loss, as to whether fixed or current assets were affected. The practical aspect of the problem is the adoption of a policy not in contravention with the law, and in the determination of this phase of the subject there are some court decisions none of which, however, seem entirely trustworthy.

It must be borne in mind that in the types of organization known as single proprietorship and partnership, there is little legal restriction in their formation and operation. The law presumes that the full liability of the owner or owners offers sufficient protection to creditors. Hence the withdrawal of profits or capital is not safeguarded in any way in the interest of creditors. With the corporation, however, provision is specific that nothing shall be returned to the stockholder except profits so long as the business continues in operation. Exception here is usually made for those concerns operating assets which are subject to depletion, in which case it has been held that dividends may include a return of the depleted portion. The theory of the law is that, except as just indicated, the capital of a corporation is an _indication_ to creditors of the amount by which the assets may suffer shrinkage and their claims still be protected in full. Hence, the return of capital in the form of dividends is not allowed, as that would impair the margin of safety for creditors.

From the practical standpoint, therefore, the problem concerns only the corporate form of organization and that only in its relation to dividend payments. So long as the profits are reinvested in the business, neither creditors nor owners have any cause for action, except in case of fraud.

Legal Decisions as to Asset Losses

In decisions relating to this question of asset losses, the courts have seen fit to make a distinction between what they term fixed and circulating capital, corresponding in the main to the fixed and current classification of assets for the balance sheet. In the leading English case,[59] it was held that a trust company holding stock, which during the last business year paid 50 per cent dividend but which before the end of the year became utterly worthless, may include the 50 per cent in its yearly profit, without deducting a penny for the depreciation of the property from which this profit was derived. In the language of the court Lord Justice Lindley said: “Fixed capital may be sunk and lost and yet the excess of current receipts over current payments may be divided. But floating or circulating capital must be kept up, as otherwise it will enter into and form part of such excess (seeing that circulating capital, with the particulars of its purchase and sale, must appear in revenue account), in which case to divide such excess without deducting the capital which forms part of it will be contrary to law.”

[59] Verner v. General and Commercial Investment Trust, Limited, 2 Ch. 239 (1894).

The stock held by the trust company was for permanent investment and therefore in the nature of a fixed asset. The language of the court is quite specific and there would seem to be no _need_ for including all or any portion of the loss in the current statement of profit and loss. Other later decisions have somewhat extended the doctrine so that it has been held that the current profits may be determined without making any provision for a loss, even of circulating capital, occurring in a _previous_ year. Thus it would seem that so far as the _legality_ of profits determination is concerned, each fiscal period may be counted as entirely free from liability for the happenings in other periods—a unit of business history distinct from all other units. These decisions are English cases and have not always been followed in this country. For a statement of the prevailing opinion in this country, see page 443 of Chapter XXIV, “Dividends.” The danger of the position is apparent. In the hands of unscrupulous managers the profit and loss might be so manipulated that alternate years would always show profits in spite of the fact that the company’s capital was constantly being depleted.

Loss Charged against Current Profits

In stating the question on page 393, three alternatives were presented by way of solution. The first of these suggested that the entire loss be treated as a charge against the profits of the current period. It has been seen that there is no support in law for this method of handling the loss, nor is there any need or justification for it from the standpoint of correct accounting theory. Only such losses as occur more or less regularly and which within the experience of the business can be fairly accurately estimated, are proper charges to the current period. It is not the function of the periodic profit and loss statement to reflect charges covering contingencies which with almost equal certainty may or may not materialize.

Loss Treated as Deferred Expense Charge

The second solution suggested, viz., that the loss be treated as a deferred expense to be shared by several succeeding periods, has much to commend it and little to condemn it, except a possible lack of business foresight as will be evident when the third solution is examined. It may be argued, and with a good show of reason, that such losses are so infrequent, occurring perhaps only once or twice in the life of any business, as to make it unfair as between periods to burden some with a charge of this sort and not all. For comparative purposes, the spreading of the loss over several periods will tend to obscure the true state of operations for those periods, although that is largely a matter of the way in which results are presented. The situation is relentless, however. If it is desired to recoup the loss in order not to show an impairment of capital, the loss must be charged in its entirety or piecemeal against profits. If there are no accumulated profits against which it can be charged in its entirety, it must be charged piecemeal against current profits.

Loss Charged to Capital

The third solution suggested that the charge be made directly against capital. Without the limitation as to the policy of recouping the loss mentioned above, this solution may take two somewhat different directions. If a surplus has been accumulated out of previous profits, such surplus constitutes a part of the capital and provides the logical place for setting up the charge. If no surplus is available, the loss must be charged against the capital stock, thus constituting an impairment of it. In either case, the results of the current period's operation are not affected, except in so far as a diminution of the assets may have made necessary a curtailment of operation. Of course, the charge against the capital stock, whether made direct to the account or carried in a separate account, does not automatically bring about a reduction of the capital stock; that can be accomplished only by legal process and is often shunned because of the difficulties incident thereto and also because of a possible reflection on the concern's credit occasioned thereby. The charge does indicate a reduction in the value of the shares outstanding. Since there is no compulsion in law and there may be no need from a business standpoint that the loss be recouped, undoubtedly this third method offers the best solution both practically and theoretically.

That this is so is brought out clearly by H. R. Hatfield's almost classic illustration:[60] "An individual's entire income is derived from ten houses each worth $10,000 and each yielding 10 per cent net income. If two of these houses burn down, uninsured, the common sense view is that the proprietor's income is thereby cut down from $10,000 to $8,000 per annum, and that coincidentally, there is a loss of capital of $20,000. It never occurs to him that he must consider his income as entirely cut off for two years until the principal can be restored. Similarly it might be an act of cruelty to dependent stockholders to stop dividends entirely until an exceptional loss is reimbursed. The main difficulty is that in a corporation such an occurrence really calls for a reduction of the nominal capital, a cancellation of part of the capital stock.... The criticism properly to be made is not so much that dividends are paid before restoring the capital ... but rather that the capital stock has not been reduced to correspond with the amount of remaining assets, before the dividend is paid."

[60] In "Modern Accounting."

It should be stated that this criticism is of little real weight if the balance sheet shows the true condition of the business. Carrying the loss as a part of the assets, particularly if clothed with a title the meaning of which even a code expert could but lamely guess at, is to be condemned. If, however, the title clearly indicates the nature of the item, the situation is not so bad, although it does reflect the slavery to form which compels some very well-meaning individuals to show impairment of capital on the asset side of the balance sheet for the sake of making it _balance_. The best practice compels the showing of impairment items as direct deductions from capital. The carrying value of the asset destroyed must, of course, be reduced to accord with the facts of present value, and, if there is no surplus available, the amount of the loss should be shown as a deduction from the capital stock outstanding,

short-extended, with the present capital full-extended, somewhat as follows:

Capital Stock Outstanding $1,000,000.00 Fire and Earthquake Loss resulting in impairment $250,000.00 ---------- Net Capital available for the business $750,000.00

Profit on Work in Progress

A second problem to be solved in the determination of profits is concerned with the allowance or non-allowance of profit on work in progress but not completed. Most manufacturing and contracting concerns have at all times a more or less constant volume of work in various stages of completion. At the close of the fiscal period when results are summarized, the proper treatment of this uncompleted work is an important matter. The general principles governing the valuation of this work were discussed in Chapter XIII where it was pointed out that in the main conservative business policy demands that work in progress be included in the inventory at full cost, which is to include both prime cost and an equitable share of burden accrued to date. Manifestly this principle precludes the taking of any profit, the theory being that there is no profit until goods are sold. A full discussion of the subject requires separate consideration of work which is being done on order or contract and work for the concern's own stock-in-trade, due weight being given always as to whether the unit of work is large or small.

Goods Made for Stock but not Sold

The general principle mentioned above must usually be applied to the valuation of the concern's own stock-in-trade in process of manufacture. Here sales are being made constantly from finished stock and manufacture replenishes the stock. But the essential step before profits can be claimed, viz., making the sale, usually comes after the process of manufacture and not before. It may sometimes happen that stock is sold out ahead of its manufacture, because the factory is not able to keep up with sales. It is not intended here to include the case in which it is the custom of the trade to sell goods in advance of their manufacture and regulate the operation of the factory to turning out the advance orders booked. This will be considered later. The discussion here concerns those firms which usually keep their finished stock well ahead of sales but because of the exigencies of the market find themselves behind their sales. Such a situation is sometimes called a sellers' market. If purchasers contract for goods with full knowledge of factory conditions, such sales are in the nature of work on contract and might in unusual instances be so treated. Usually, however, conservative management requires that no profits be taken under such circumstances.

Goods Made to Order

Where the factory works only on order, conditions as to profit-taking are somewhat changed. Here, the sale has already been made for delivery of the product at some future time, named or left indefinite. While, of course, cancellation of the order is always possible before date of delivery and acceptance, inasmuch as here we have under consideration a special product made to individual specifications and not a stock or standardized article, cancellation of the contract is not probable without incurrence of damages or even being held to specific performance. Under these circumstances it is apparent that, within reasonable limits, a portion of the profit may be taken up in the current period, which has, of course, done a portion of the work and therefore earned a portion of the profit, if there is one. This last contingency is, of course, the crux of the whole problem. If a portion of the profit is taken, this necessitates a predetermination of profit on the whole contract, an estimate of the portion of the contract completed, and adequate provision for unforeseen difficulties in completing the work. Where conditions are such that these things can be done with any degree of certainty, there is not only no objection to taking up a portion of the profit for the current period, but it is the only way in which profits may be allocated to the period earning them and so stabilized somewhat as between periods. As has been said already a number of times, the summary of results at the close of regular periods is in many cases based on _estimate_, which in the final analysis is merely the expression of an opinion. If the estimates are made with due care, in the light of all available information and probable contingencies, and without intent to deceive or defraud, more than that cannot be asked of any concern.

The practical application of this principle requires consideration. In some few cases the volume of product passing through the factory will be fairly constant as between periods. Where this is so—and frequent tests should be made to establish it—it would be a useless expenditure of effort to make the estimates necessary for determining profits on uncompleted work. The same situation is met with also in concerns where the unit of work is small. Here the effort, entailed in making the estimate is more than offset by any advantage gained thereby. If the product is somewhat standardized, it may be possible as a result of past experience to make a rough estimate on the basis of the _volume_ of work in progress instead of by means of an examination of the conditions of each contract. Such a policy is fraught with many pitfalls and, as a usual thing, does not commend itself to conservative management;

speculative conditions are too many.

Profits on Long-Term Contracts

Where the unit of work is large, conditions are somewhat different, however. The necessary estimates are not based on so many uncertainties, and, oftentimes, financial considerations and an equitable treatment of stockholders demand the determination of profits on work in progress. Thus, one contract extending over a number of years may occupy the entire attention and facilities of a concern. To withhold profits if earned, until the completion of the contract might work a real injustice. Such contracts are usually financed by means of periodic payments on account, based on a careful estimate by the supervising engineer or architect of the portion completed on such dates. As these estimates are sufficiently accurate on which to base payment of contract price, they can be allowed to serve as the basis for a determination of profits after liberal reserves for contingencies are made.

The nature and terms of the contract itself will usually indicate the method of estimating the profit. If the price agreed upon is for the contract as a whole, then extraordinary care must be exercised in estimating the portion completed and almost a seer's prevision of the requirements to complete is needed. If, on the other hand, the contract is broken into smaller units on which price is based and there is no guarantee as to the number of units in the contract, profit may be taken on the number of units completed. Thus, a contract calling for excavation of earth or other material may be taken at a named price per cubic yard. The building of a canal, the driving of a tunnel, the construction of a dam and reservoir, are frequently handled on this or a similar basis. So, also, the use of a concern's equipment and organization on a per diem basis. Under these conditions each fiscal period can safely take its profits or losses with little regard for the uncompleted portion of the work. Contracts taken on a so-called "cost plus" basis, i.e., at cost plus a definitely agreed upon per cent of profit, may have their profits determined without consideration of the uncompleted portion.

Profit on Goods Awaiting Delivery

Similar to the problem of profits on work in progress is that of profits on goods awaiting delivery. The goods have been sold, are completed, and may even be prepared for shipment. All that remains is delivery and that cannot be effected until the date agreed upon. In some lines of trade this method of sale is a time-honored and even necessary custom. The practice is found in some kinds of clothing industries, woolen manufactures, farm implements, etc. Here because the product is a standard product, cancellations take place and are usually allowed right up to, and in some instances beyond, the date of shipment. Because of this trade practice, profits should never be taken until delivery has been effected. To a similar or even greater extent than with work in progress, costs and expenses are under this principle incurred and charged in one period and the profit is taken in another period which is not thus charged with the cost of getting the income.

Two methods of handling the difficulty are met. The one operates on the expectation that the volume of such orders awaiting delivery is fairly constant as between periods; hence, the income from goods of this sort delivered during the current period is charged with the costs and expenses of goods to be delivered in future periods. This is the rule-of-thumb method to be used where accurate allocation of costs is neither necessary nor justified by results.

The other and more accurate method consists of deferring the costs and expenses properly applicable to the deferred income. But the difficulty of determining just what expenses are so applicable often causes this method to break down, giving less accurate and dependable results than the first. The roseate optimism of the average proprietor or manager as to his own business almost always results in a too liberal estimate of the portion of expense to be applied against the deferred income. In treating this problem of profits in connection with contracts and the length of the cost period (Chapter XIII), the principle was stated that such goods should be included in the inventory at cost. This results in deferring the main item of cost, but omitting the further costs of selling and administration which belong to all sales effort made and to the progress of the order up to the point of delivery. While theoretically these should be deferred, practically the estimate of the amount to be deferred should lean on the side of too little rather than too much. Where, as stated above, the volume of this kind of trade is fairly constant, the rule-of-thumb method first stated gives more satisfactory and safer results.

Interdepartment Profits

The problem of interdepartment profits was stated and discussed briefly in Chapter XIII, page 233, and will later be treated in another connection (see page 607 following). Here, it may be repeated that while such profits are not to be allowed because they are not yet realized, they may, under exceptional circumstances, be estimated and shown if offset by reserves of an exactly equal amount.

Profits Due to Appreciation of Assets

The problem of profits due to appreciation of assets, both fixed and current, has also been handled in the chapters on valuing the various assets. All that need be said here is that such profits are not realized until the asset is sold. While for purposes of credit it may be wise and proper to show the true valuation of the assets, for the purpose of profits, particularly profits available for dividends, such appreciation in values must not be taken into account. It should be remembered that appreciating the value of fixed assets frequently results in the necessity of meeting higher depreciation charges and is thus not an unalloyed gain. The payment of dividends based on such profits would, without taking profits from other sources into consideration, always result in the diminution of the fund of working capital.

Capital Profits

There remains a final problem, viz., that of capital profits, which is more a question of their disposition than determination. When any of the fixed assets are sold, the profits, if any, are classed as capital profits. These are as legitimate as those arising from sale of stock-in-trade or other source, and belong to the owners. The question of their disposition hinges mostly on practical considerations. If the sale is for cash, funds are available for distribution without encroaching upon the working capital. If not for cash, payment of dividends based on such profits might seriously diminish working capital. The question as to whether capital profits should ever be distributed is, of course, a mooted one. Many well-known cases of such distribution—the so-called cutting of juicy melons—are on record. Conditions seem to justify their payment at times, and under other equally impelling conditions distribution of them should not be made. As a general policy it is always safe to set aside such profits in a special reserve to be used to care for capital losses. If the company is well provided with such reserves beyond any reasonable doubt, it is oftentimes unwise and unjust to withhold their distribution. Of a similar nature and to be handled under like considerations are the profits arising from sale of capital stock at a premium, the reissue of forfeited stock, etc.

In concluding this subject no better summarization of the accounting principles and practical considerations to govern in the determination of profits can be given than the following from A. Lowes Dickinson:[61]

[61] In “Accounting Practice and Procedure.”

“1. All waste, both of fixed and circulating assets, incident to the process of earning profits by the conversion of circulating assets must be made good out of the profits earned.

2. Profits realized on sales of fixed assets should be first applied to make good estimated depreciation (if any) in other fixed assets not resulting from the ordinary conduct of the business. If there is no such depreciation, such profits may be distributed as dividends, but should be distinguished from the operating profits.

3. A sufficient surplus should be accumulated (in addition to the provisions required to maintain wasting capital assets) for the purpose of making good losses due to shrinkage in values of fixed assets arising from causes other than the ordinary operations of the company. This provision must, however, be considered more a question of policy than a requirement of sound accounting.”

CHAPTER XXIII

SURPLUS AND RESERVES

Definition

Under the corporate form of organization, “surplus” in its broadest sense represents the difference between the net worth of the business and the capital stock issued and outstanding. Because of the legal requirement that the value of the capital stock be shown always at the original amount—which is usually par—any increments or decrements in value because of profits or losses made and reinvested in the enterprise must be shown under separate heads. Thus surplus—or deficit—is the general term to indicate this increase in value. In England the term “rest” is used in almost this same sense. “Margin” is also a title occasionally seen.

Because of a much narrower technical meaning given to surplus, the general adoption of another term with the broader connotation above given would serve a really useful purpose. Of the titles in use, margin seems best to express the exact shade of meaning. In the interest of a standard terminology, the highest accounting authorities are coming to restrict surplus to that portion of the margin

available for dividends and in that sense the word will be used in this chapter. Contrary uses of the word are frequently met. In banking institutions the surplus is almost as inviolable as the capital stock itself and is never used for dividend purposes. In government-controlled or supervised institutions, these special uses of the term have become too well established by law and custom ever to hope for a change in the interest of general uniformity.

Creation of Margin

The sources of the margin have for the most part been already indicated. The chief source is the net profit for the period as determined by the Profit and Loss account balance. What enters into that balance has been discussed in Chapter XXII, where it was also pointed out that under some circumstances it may be entirely legitimate to carry some temporary proprietorship items directly to a vested proprietorship account instead of by way of the summary account. Thus there may be other sources of margin than the current balance of Profit and Loss—extraordinary items whose inclusion with current summaries of operation would render those summaries useless as a guide for judging comparative results of various periods.

Capital Stock Premiums. Sometimes, for the purpose of creating a margin at the inception of an enterprise a fund is contributed beyond the par value of the capital stock issued. This is accomplished by purchase of the stock at a premium, and is frequently seen in banking institutions, where it serves as an easy and speedy way to satisfy the law's requirements for the accumulation of a "surplus." The effect of this is to give the institution a better standing than it would otherwise have. The reduction of the capital stock outstanding without full recompense to the stockholder also results in the creation of margin. This is often done in reorganizations when fewer shares of the new stock are given than were held of the old. The effect, then, is to set up a book profit against which may be charged the existing deficit, and so secure a balance between the real net worth and the par of the new stock issue.

Stock Donation. Another source of margin is a stock donation. This may result in only a book profit. It is exceedingly difficult and generally impossible to determine the true value of many speculative ventures, such as mining enterprises. As a general rule, capitalization based on opinion is usually overcapitalization. While a stock donation may have no relation to real values and is merely a method of securing working capital, its effect when the stock is sold is to increase the cash asset and show a profit of an equal amount. Some authorities hold that instead of retaining the profit on the books, the logical thing is to reduce the carrying values of the speculative assets by the amount of the realized profit on stock donation. There would be more reason for this treatment were there any real relationship between the amount of the stock donation and the overvaluation of the assets. Since usually there is none and the whole undertaking is speculative, there is no valid objection to showing the realized profit, as the public is sufficiently warned by the nature of the enterprise. All stock donation is not of this sort, however. Occasionally a very real profit results which should be treated as a margin item.

Stock Assessments, etc. Similar to a stock donation is a stock assessment. In cases of reorganization or of impending bankruptcy, a pro rata assessment is levied on the outstanding shares. Being a donation, it constitutes a proprietorship increase item and becomes a part of the margin. This method is frequently used for the purpose of wiping out a deficit, an impairment of capital, and is, of course, a _real_ profit as distinguished from a _book_ profit. Similarly, additional payments made by common shareholders to convert their holdings into preferred shares are a realized profit and should be recorded as part of the margin.

Capital Profits and Bonuses. Capital profits, as discussed in Chapter XXII, have their proper place of record direct into some margin account rather than by way of the current Profit and Loss. Donations from the outside, such as factory sites and other bonuses, sometimes given to induce enterprises to locate in certain places, must also be treated as entries direct to a margin account. These and other like items constitute the chief sources of the margin.

Disposition of Profits

The statement of profit and loss carries the summary of operations to the point of showing a net profit or a loss for the period. The next step for consideration is the disposition made of these profits. This is sometimes spoken of as the appropriation of profits. Two practices are met at this point. Under the one, appropriation is made directly from Profit and Loss for all desired purposes. Any unappropriated balance goes into Surplus account, which will represent the balance of profits available for dividends but not used. Under the other, the Profit and Loss balance is transferred to Surplus out of which all appropriations are made, the residue remaining therein showing the same condition as under the first method. Where this second method is followed—and it is more prevalent than the first—a statement of surplus is needed for full information of the period's transactions, thus providing a connecting link between the statement of profit and loss and the balance sheet. The form of this statement is given on page 426.

Reserves

From the point of view of the stockholder's immediate interest, the appropriation of profits for dividends is his chief concern. Other and equally vital and urgent uses are found for profits in any well-managed concern with an expanding outlook towards the future. The appropriations of these profits to definite uses are very generally carried under the title of reserves with suitable descriptive phrases. Thus we may have a Sinking Fund Reserve, an Insurance Reserve, a Building Fund Reserve. Sometimes these are called "reserve funds" but the demands of an accurate nomenclature limit the use of "fund" to an asset account. The title "undivided profits" is also met. Where careful differentiation is made, "surplus" should be used to denote profits available for dividends; "reserve," for profits set aside for a specific purpose; and "undivided profits," for those on which no definite action has been taken.

Different Meanings of Reserve

Because of the loose way in which the term reserve is used by the layman and its different uses by the professional accountant, an examination of these uses will be made at this point. As a distinctive banking term, "reserve" is used to indicate the amount of cash and cash items on hand and on deposit which under the law may be counted as a cash reserve fund held against deposits and note issues. This use of "reserve" is limited strictly to financial institutions.

We find also various so-called reserves shown on the commercial balance sheet, both among the liabilities and the assets. As deductions from the assets are the various depreciation reserves and reserves for bad and doubtful accounts and notes receivable. These items are "offsets" to the carrying values of the assets in order to effect a true valuation of them. For reasons previously set forth, these offsets are carried in accounts separate from their corresponding assets. Thus they are in the nature of suspended credits to asset accounts and, if properly estimated, are in no sense related to profits; nor have they any of the elements of profits or proprietorship in them. It is unfortunate that there is lacking an adequate title, other than reserve, for this group of items. The terms "allowance" and "estimate" have been suggested, but so far have not found general favor. This group of reserves are called valuation reserves.

Reserve for Bad Debts

A fine distinction is sometimes drawn between the reserve for depreciation and the reserve for doubtful accounts, on the ground that at the time of the creation of the reserve in the one case, the depreciation is an accomplished fact, all that is then required being a fair estimate of it; whereas in the other case no _particular_ account is known to be uncollectible, business experience teaching, however, that in the aggregate there will be some loss from this source. The purpose of this reserve is to bring about as on a given date an appraisal of the claims against customers in the light of past experience, and so apply the expense due to this cause to the period in which the sale transaction took place. This purpose is not always accurately accomplished but the estimate at the close of each period does effect an equalizing of the bad debts expense from year to year. This distinction makes the reserve for doubtful accounts closely approximate to a contingent reserve, as will be seen later. It seems best, however, to hold to the original classification and include the bad debts reserve with the other valuation reserves.

Under-and Over-Estimate of Reserves

Inasmuch as these reserves must from the nature of things always be estimates, the probability exists of an under-or over-estimate. It is apparent that an under-estimate effects an inflation of profits due to an overvaluation of the assets. Equally apparent is it that an over-estimate brings about an understatement of profits due to an undervaluation of the assets. The effect of this is to make the valuation reserve account a mixed account. Instead of its content being solely a suspended credit to an asset, it includes also a true reserve of profits. If at any time the facts indicate a too liberal or too parsimonious estimate in the past, adjustment should be made to accord with the newly determined facts of experience. An immediate adjustment is usually preferable to a gradual one effected by an allowance below or above the new basis determined for the estimate.

Depletion Reserves

Similar to the depreciation reserve is the depletion reserve. On the basis of the value at which the wasting or depleting asset was originally brought upon the books, a periodic estimate of the portion used up in operation is necessary to show the true present value of the asset. Thus, timber and mining properties require for their periodic appraisal an estimate of the extent of exhaustion of the natural product. This is neither required by law nor always by business policy. But when the estimate is made it is in the nature of a valuation reserve and will be so classed here.

Operating Reserves for Accrued Costs

Another group of items, frequently carried under the title reserves, includes estimates of expenses the exact amount of which is not known at the time of closing the books, and sometimes those of which the exact amount is known but which are unpaid as on that date. Among the first are such items as taxes, sales discounts, and the like. Among the second are wages, salaries, rents, etc., accrued. These two classes are together sometimes called “operating reserves.”

There is some difference of opinion with regard to the proper allocation of taxes and estimated sales discounts. Inasmuch as taxes are not usually determined, or at least payable, during the period covered by them, there is a temptation to defer their incidence to a later period. If the taxes become a claim of the state against the property as on a given date, certainly they should be treated as applicable to the period covered by the claim even though the amount of them cannot with accuracy be determined.

With regard to sales discount, the situation is somewhat analogous. At the close of any fiscal period, some of the open claims against customers are by the sales contract subject to discount, and experience proves that some of these discounts will be taken advantage of. Here also, difference of opinion prevails as to the proper allocation of the expense. Should the period in which the sale is made suffer the loss, or should it be charged to the one in which the discount is taken? If sales discount is looked upon either as a direct deduction from sales or as a selling expense, certainly it should be charged to the period making the sale. On the other hand, if it is regarded as an item of financial management, a means of securing ready funds, it is sometimes argued (though this is not the usual point of view) that the period enjoying the benefit should also be charged with the expense of securing the benefit. Against this argument it may be pointed out that the current period carrying the customers’ accounts which are subject to discount fails to show its liability, based on the sales agreement, to accept something less than the face amount of the claims. A balance sheet in which no suitable provision is made therefor is one which does not reflect the true status of all items, and to that extent is not a good balance sheet. Provision should be made not only for those expenses which are known to have been incurred and which remain unpaid, but also for those which the statistics of experience show will have to be met. Conservative practice, therefore, requires the inclusion of this estimate and applies it as an expense of the period in which the originating transaction took place. All the costs of the contract entered into, of which expected sales discount is one, are made to apply to the period giving rise to the contract.

Collection Costs not under Contract

The above argument is occasionally made use of in support of the inclusion of expected collection costs on claims against customers outstanding at the close of a period. From a theoretical aspect the point may be argued, but, unlike the item of sales discount, these are not costs which the concern is liable for _under contract_. From a practical standpoint, except under very unusual conditions, it is an undesirable refinement of the principle of allocation of costs as between periods. Where a collection department is maintained, costs of collection are practically uniform from period to period and are best considered as expenses of the period in which the cost is incurred.

Sales Discounts on the Balance Sheet

As to the manner of showing expected sales discounts on the balance sheet, practice is not uniform. It is sometimes shown added to the reserve for doubtful accounts and the sum of the two deducted from claims against customers, indicating thus the amount which it is expected can be realized therefrom. Others show it among the liabilities, on the ground that it differs from the estimate for bad debts in that it is an expense for which the concern has made itself liable under its sales contract. The distinction is finely drawn but probably well taken.

Distinction between Reserves and Accrued Items

The use of the title reserve for some of the items included as operating reserves is unfortunate and leads to confusion both in terminology and in understanding. Why unpaid expenses of any kind should be called reserves for expenses when the amount of them is definitely known has never been satisfactorily explained; yet the practice is sometimes met. There is some excuse in the case of expense items the amount of which cannot be definitely determined either from the nature of the item itself or other conditions over which the concern has no control. Thus, “Reserve for Wages” is usually a misnomer, the title “Wages Accrued” showing the item correctly; but “Reserve for Taxes,” while just as true a liability as the other item, may be justified on the ground that the latter is only an estimate subject to correction when the exact amount is known, whereas the former is already definitely

known.

Contingent Reserves

So-called contingent reserves are sometimes handled as a part of this group, although best classified by themselves. A contingent reserve is one which represents an effort to provide for certain contingencies, such as guarantees on work done or products sold, lawsuits pending adjudication, etc. As R. H. Montgomery[62] so pertinently says: “the reserve should be based on evidence more tangible than a mere desire to be conservative. A vague feeling that something might have been overlooked which would decrease the assets or increase the liabilities is not the proper subject for a reserve. Conservative management ‘reserves’ part of its surplus for such contingencies, but it appears as surplus and not as a liability.” As mentioned above, sometimes the reserve for bad debts is classed as a contingent reserve. Contingency is inherent in the item but the certainty of its occurrence cannot be reasoned away. The use of contingent reserves may therefore well be limited to provision against contingent liabilities. In other words, they represent the best available estimate of the amount of such liabilities. To draw a dividing line between operating and contingent reserves is extremely difficult; both are created by charges to various expense accounts. It is merely a matter of degree as to the certainty of the events’ happening for which provision is being made. On the border line between the two are such items as reserves for insurance where the concern carries its own insurance and must make a periodic expense charge in lieu of the usual premiums; reserves for pensions where a pension policy is in effect, the charge creating it being here viewed as a part of the wages expense—the share of wages to be paid in the future which must be borne by the current period; reserves for sick benefits, which are in all respects similar to pension reserves; and so on. In some cases reserves for supersession of patents, or other assets whose length of service life is dependent on extreme contingency, are classed with this group.

[62] In “Auditing, Theory and Practice.”

Deferred Income—Misuse of Term

Deferred income is sometimes classed as a reserve. Thus, insurance companies carry the portion of their unearned premiums as on a given date, as a reserve. The use of the title is well established in that connection and the nature of the items is well understood. On commercial balance sheets where no outside authority can give a definite meaning to the term, its use for deferred income is to be deprecated and discouraged. Deferred income is a liability and not a reserve; the current period has not rendered the service to earn the income and is liable to the period in which the service is rendered.

Proprietorship Reserves

This disposes of all the asset and liability reserves and leaves for consideration the true profits or proprietorship reserves. As between these two main classes of reserves, as their titles indicate, the proper allocation of the one is among the assets or liabilities, while the other must be shown as a part of the net worth of the corporation. As to the nature of proprietorship reserves little more need be said. There are just two classes of items met here, viz., those shown as such openly on the balance sheet and those which are hidden or secret, latent among the various other items on the balance sheet. Proprietorship reserves represent profits reinvested in the business. Any profits, operating or capital, not paid out as dividends give rise to proprietorship reserves.

Secret Reserves

So-called secret reserves are brought about in various ways. Their creation may be intentional or accidental, but their source is the same in either case. Reserves of profits may be hidden either by undervaluation of the assets or overvaluation of the liabilities. Undervaluation of the assets may point to an ultra-conservative policy of management. Thus, some concerns write off the value of their fixed equipment of various kinds as rapidly as the net profits can absorb it and still leave sufficient for a reasonable dividend. Financial institutions in this way carry their furniture and fixtures and sometimes even banking houses, at ridiculously low figures or do not show them at all.

Undervaluations are accomplished in various ways. Charging an excessive rate of depreciation; making unnecessarily large reserves for uncollectible accounts, sales discounts, etc.; showing a more rapid depletion of natural assets than justified by the amounts used; charging the sums spent for assets to an operating expense; setting up an excessive cost of goods sold by means of inventory valuations of stock-in-trade at a figure lower than cost or market; crediting items of income to asset accounts instead of to income accounts, such as rentals on properties owned; crediting interest and dividends received to the stocks and bonds accounts—all of these serve the purpose of creating hidden reserves by means of a misstatement of fact.

Items wrongfully included among the liabilities bring about the same result. Here, however, the procedure is somewhat more patent because the creditors themselves check up on all actual liabilities. Liabilities can be settled only by an actual reduction of assets. Manipulation of the operating and contingent reserves explained above offers, however, an easy means of overvaluing the liabilities. A too liberal estimate of the amounts of these reserves makes them represent in part true proprietorship reserves but the proprietorship element in them is obscured by their title and their inclusion among the liabilities on the balance sheet.

It is, of course, apparent that no balance sheet containing secret reserves is a true statement of condition and the practice of creating secret reserves must usually—perhaps always—be condemned.

Argument for Secret Reserve

In justification of the secret reserve, it is sometimes said that in certain lines of business where the maintenance of unquestioned credit or the promotion of a stability ordinarily lacking in speculative enterprises is highly desirable, there is a very pressing need for the secret reserve. Through its use, extraordinary losses, which otherwise would result in very unfavorable fluctuations of stock values, may be absorbed by means of a charge to some undervalued asset and so bring it to its true value; or by a charge against an over-estimated liability reserve and so bring it to a true showing. This frees the current profit and loss from the charge, maintains a regularity of net profits, and prevents the disasters sometimes attendant upon violent fluctuations of stock values brought about by the knowledge of these extraordinary losses. That is the strongest case which can be made out in favor of the secret reserve.

Argument against Secret Reserve

The fact, however, must not be overlooked that without any understatement or misrepresentation of property values at any time there could just as easily be created an open “surplus” or margin of an amount equal to the secret reserve, against which these losses could as well be charged. The creation of such a margin can be justified on the same grounds on which the justification of the secret reserve is attempted, viz., the maintenance of high credit and stability. The reduction of the margin through its absorption of the loss would, of course, be somewhat more patent than the reappearance of values previously written off, although analysis of a balance sheet will invariably bring the true state of affairs to light. Furthermore, present stockholders, and certainly prospective investors and creditors, have a right to know the true condition of affairs. The appearance of a large proprietorship in addition to capital stock, revealed by a sizable margin, gives the stock a value in addition to that based solely on the dividend rate. A stockholder has a right to his share of the profits during the period of his ownership. If it is not received in the form of dividends, he should at least be partially recompensed when he disposes of his holdings, by an increased price for the stock as reflected by the portion of profits reinvested in the business.

The attitude occasionally taken that directors know best what information as to true condition of affairs should be given to the owners and what should be withheld, should, in these days of increasing publicity, be given no serious consideration. In the hands of unscrupulous directors, the secret reserve is an instrument for the covering up of questionable and even fraudulent practices. Stock values can be intentionally hammered down by a false showing of profits and so inure to the benefit of a group of prospective purchasers desiring to “freeze out” unsuspecting stockholders. All in all, therefore, little can be said in justification, but much in condemnation, of the practice of accumulating secret reserves.

Earmarking of Reserves

According to the definition of surplus laid down in the beginning of this chapter, limiting the term strictly to the profits available for dividends, those profits which are applied to reinvestment for specific purposes must be separated from the “surplus” and given distinguishing marks to indicate their purpose. Thus, profits reserved for the purpose of acquiring a fund of assets out of which to pay off debt obligations maturing in the future may be set aside under the title “Sinking Fund Reserve”; those set aside for the purpose of extension of plant as “Building Fund Reserve”; those for the purpose of providing a pension fund as “Pension Fund Reserve”; and so on. This is sometimes called “earmarking” the reserve.

Separation into differently named reserves serves no other purpose, however; it does not in any way insure the inviolability of the reserve; it acts merely as evidence of the intention and purpose of the board of directors which authorized the application of profits to that purpose. It is the expression of a business policy and as such is, without other compelling force, subject to the approval and continuance or to the disapproval and nullification of any subsequent board. These reserves are profits and as such belong to the shareholders and may be distributed among them as dividends. A reasonably conservative policy as to reserves usually has the

support of stockholders, and a subsequent board will not risk loss of position and standing with the stockholders by a change of policy as to reserves without good and sufficient reasons for doing so.

Continuity of Reserve Policy

Effort is sometimes made to secure continuity of the reserve policy. This may be accomplished in several ways. Oftentimes it is made compulsory by outside regulatory authority, as in the case of national banks which are required to set aside annually a certain part of their profits until these have accumulated to an amount equal to 20% of their capital stock. Similar conservatism can also be compelled by contract entered into with creditors. It is a frequent provision of the trust agreement covering an issue of bonds that “there shall be set aside out of profits” a certain amount at the close of each fiscal period for the purpose of creating a fund with which to redeem the bond issue when it falls due. The funds may be placed in the hands of a trustee, which guarantees the application of them to their intended use but does not, of course, insure the retention of profits to an equal amount in the business. Finally boards of directors may be compelled by the stockholders to adhere to a certain policy by provision in the by-laws for the accumulation of reserves. This policy is, of course, subject to change by the stockholders themselves. Where the power to make and change by-laws is put in the hands of the directors, this last method is not applicable.

Reserves may always be made a part of the permanent capital through their distribution in the form of a stock dividend. This secures the continuance of profits reserved to date but does not guarantee either a similar application of future reserves

PSYCHE’S TASK

A DISCOURSE CONCERNING THE INFLUENCE OF SUPERSTITION ON THE GROWTH OF INSTITUTIONS

SECOND EDITION, REVISED AND ENLARGED TO WHICH IS ADDED THE SCOPE OF SOCIAL ANTHROPOLOGY _AN INAUGURAL LECTURE_

BY J. G. FRAZER, D.C.L., LL.D., Litt.D. FELLOW OF TRINITY COLLEGE, CAMBRIDGE PROFESSOR OF SOCIAL ANTHROPOLOGY IN THE UNIVERSITY OF LIVERPOOL

MACMILLAN AND CO., LIMITED ST. MARTIN’S STREET, LONDON 1913

[EPIGRAPHS]

Good and evil we know in the field of this world grow up together almost inseparably; and the knowledge of good is so involved and interwoven with the knowledge of evil and in so many cunning resemblances hardly to be discerned, that those confused seeds, which were imposed on Psyche as an incessant labour to cull out and sort asunder, were not more intermixt.

Milton, _Areopagitica_.

Il ne faut pas croire cependant qu’un mauvais principe vicie radicalement une institution, ni même qu’il y fasse tout le mal qu’il porte dans son sein. Rien ne fausse plus l’histoire que la logique: quand l’esprit humain s’est arrêté sur une idée, il en tire toutes les conséquences possibles, lui fait produire tout ce qu’en effet elle pourrait produire, et puis se la représente dans l’histoire avec tout ce cortège. Il n’en arrive point ainsi; les événements ne sont pas aussi prompts dans leur déductions que l’esprit humain. Il y a dans toutes choses un mélange de bien et de mal si profond, si invincible que, quelque part que vous pénétriez, quand vous descendrez dans les derniers éléments de la société ou de l’âme, vous y trouverez ces deux ordres de faits coexistant, se développant l’un à côté de l’autre et se combattant, mais sans s’exterminer. La nature humaine ne va jamais jusqu’aux dernières limites, ni du mal ni du bien; elle passe sans cesse de l’un à l’autre, se redressant au moment où elle semble le plus près de la chute, faiblissant au moment où elle semble marcher le plus droit.

Guizot, _Histoire de la civilisation dans l’Europe_, Cinquième Leçon.

[DEDICATION]

TO ALL WHO ARE ENGAGED IN PSYCHE’S TASK OF SORTING OUT THE SEEDS OF GOOD FROM THE SEEDS OF EVIL I DEDICATE THIS DISCOURSE

PREFACE

{vii}

The substance of the following discourse was lately read at an evening meeting of the Royal Institution in London, and most of it was afterwards delivered in the form of lectures to my class at Liverpool. It is now published in the hope that it may call attention to a neglected side of superstition and stimulate enquiry into the early history of those great institutions which still form the framework of modern society. If it should turn out that these institutions have sometimes been built on rotten foundations, it would be rash to conclude that they must all come down. Man is a very curious animal, and the more we know of his habits the more curious does he appear. He may be the most rational of the beasts, but certainly he is the most absurd. Even the saturnine wit of Swift, unaided by a knowledge of savages, fell far short of the reality in his attempt to set human folly in a strong light. Yet the odd thing is that in spite, or perhaps by virtue, of his absurdities man moves steadily upwards; the more we learn of his past history the more groundless does the old theory of his degeneracy prove to be. From false premises he often arrives at sound conclusions: from a

chimerical theory he deduces a salutary practice. This discourse will have served a useful purpose if it illustrates a few {viii} of the ways in which folly mysteriously deviates into wisdom, and good comes out of evil. It is a mere sketch of a vast subject. Whether I shall ever fill in these bald outlines with finer strokes and deeper shadows must be left to the future to determine. The materials for such a picture exist in abundance; and if the colours are dark, they are yet illuminated, as I have tried in this essay to point out, by a ray of consolation and hope.

J. G. FRAZER.

Cambridge, _February_ 1909.

NOTE TO THE SECOND EDITION

In this edition _Psyche's Task_ has been enlarged by fresh illustrative examples and by the discussion of a curious point of savage etiquette, but the substance and the form of the discourse remain unchanged. I have added _The Scope of Social Anthropology_, an inaugural lecture intended to mark out roughly the boundaries of the general study of which _Psyche's Task_ aims at setting forth some particular results. There is therefore a certain appropriateness in presenting the two discourses together to the reader.

Preface

PSYCHE'S TASK

I. Introduction

The dark and the bright side of Superstition: a plea for the accused: four propositions to be proved by the defence 3-5

II. Government

Superstition has been a prop of Government by inculcating a deep veneration for governors: evidence of this veneration collected from Melanesia, Polynesia, Africa, the Malay region, and America: evidence of similar veneration among Aryan peoples from India to Scotland 6-19

III. Private Property

Superstition has been a prop of Private Property by inculcating a deep fear of its violation: evidence of this fear collected from Polynesia, Melanesia, the Malay Archipelago, Europe, Asia, Africa, and America 20-43

IV. Marriage

Superstition has been a prop of Marriage by inculcating a deep fear of disregarding the traditionary rules of sexual morality: evidence of this fear collected from South-Eastern Asia, the Malay Archipelago, Africa, the Hebrews, the Greeks, the Romans, and the Irish: extreme severity with which breaches of the sexual code have been punished in India, Babylon, {x} Palestine, Africa, the East Indies, Australia, America, and Europe: the avoidance of the wife's mother and of a man's own mother, sisters, daughters, and female cousins, based on the fear of incest: the origin of the fear of incest unknown: belief that adultery and fornication inflict physical injury not only on the culprits but on their innocent relations: evidence of the belief collected from Africa, America, Sumatra, and New Britain 44-110

V. Respect for Human Life

Superstition has been a prop for the Security of Human Life by inculcating a deep fear of the ghosts of the murdered dead: evidence of the fear collected from ancient Greece, modern Africa, America, India, New Guinea, Celebes, the Bismarck Archipelago, and Fiji: deep fear of ghosts in general: evidence collected from America, Africa, India, Burma, the Indian Archipelago, Australia, New Guinea, and China: influence of the fear in restraining men from murder 111-153

VI. Conclusion

Summing up for the defence: by serving as a prop for government, private property, marriage, and human life, Superstition has rendered a great service to humanity: Superstition at the bar: sentence of death 154-156

THE SCOPE OF SOCIAL ANTHROPOLOGY

Anthropology, or the Science of Man, a new study: Social Anthropology restricted to the rudimentary phases of human society: not concerned with the practical application of its results: all forms of human society either savage or evolved out of savagery: hence Social Anthropology deals primarily with savagery and secondarily with those survivals of savagery in civilization which are commonly known as folklore: importance of the study of savagery for an understanding of the evolution of the human mind: existing savages primitive only in a relative sense by comparison with civilized peoples: in reality the savages of the present day probably stand at a high level of culture compared with their remote predecessors: for example, the present systems of marriage and consanguinity among savages appear to have been preceded by a period, not necessarily primitive, of sexual communism: survivals of savagery in civilization due to the natural and ineradicable inequality of men: mankind {xi} ultimately led by an intellectual aristocracy: superstition the creed of the laggards in the march of intellect: the wide prevalence of superstition under the surface of society a standing menace to civilization: the lowest forms of superstition the most tenacious of life: function of the Comparative Method in reconstructing the early history of human thought and institutions: its legitimacy based on the ascertained similarity of the human mind in all races: the need of studying savages only of late years understood: urgent importance of the study in consequence of the rapid disappearance of savagery: the duty of our generation to preserve a record of it for posterity: the duty of the Universities and of the State 157-176

INDEX 177-186

ENDNOTES

PSYCHE'S TASK

{3}

I. INTRODUCTION

[Sidenote: The dark side of superstition.] We are apt to think of superstition as an unmitigated evil, false in itself and pernicious in its consequences. That it has done much harm in the world, cannot be denied. It has sacrificed countless lives, wasted untold treasures, embroiled nations, severed friends, parted husbands and wives, parents and children, putting swords, and worse than swords between them: it has filled gaols and madhouses with its innocent or deluded victims: it has broken many hearts, embittered the whole of many a life, and not content with persecuting the living it has pursued the dead into the grave and beyond it, gloating over the horrors which its foul imagination has conjured up to appal and torture the survivors. It has done all this and more. [Sidenote: The brighter side of superstition.] Yet the case of superstition, like that of Mr. Pickwick after the revelations of poor Mr. Winkle in the witness-box, can perhaps afford to be placed in a rather better light; and without posing as the Devil's Advocate or appearing before you in a blue flame and sulphureous fumes, I do profess to make out what the charitable might call a plausible plea for a very dubious client. For I propose to prove, or at least make probable, by examples that among certain races and at certain stages of evolution some social institutions which we all, or most of us, believe to be beneficial have partially rested on a basis of superstition. The institutions to which I refer are purely secular or civil. Of religious or ecclesiastical institutions I shall say nothing. It might perhaps be possible to shew that even religion has not wholly escaped the taint or {4} dispensed with the support of superstition; but I prefer for to-night to confine myself to those civil institutions which people commonly imagine to be bottomed on nothing but hard common sense and the nature of things. While the institutions with which I shall deal have all survived into civilized society and can no doubt be defended by solid and weighty arguments, it is practically certain that among savages, and even among peoples who have risen above the level of savagery, these very same institutions have derived much of their strength from beliefs which nowadays we should condemn unreservedly as superstitious and absurd. The institutions in regard to which I shall attempt to prove this are four, namely, government, private property, marriage, and the respect for human life. [Sidenote: Four propositions to be proved.] And what I have to say may be summed up in four propositions as follows:--

I. Among certain races and at certain times superstition has strengthened the respect for government, especially monarchical government, and has thereby contributed to the establishment and maintenance of civil order.

II. Among certain races and at certain times superstition has strengthened the respect for private property and has thereby contributed to the security of its enjoyment.

III. Among certain races and at certain times superstition has strengthened the respect for marriage and has thereby contributed to a stricter observance of the rules of sexual morality both among the married and the unmarried.

IV. Among certain races and at certain times superstition has strengthened the respect for human life and has thereby contributed to the security of its enjoyment.

[Sidenote: Preliminary remarks.] Before proceeding to deal with these four propositions separately, I wish to make two remarks, which I beg you will bear in mind. First, in what I have to say I shall confine myself to certain races of men and to certain ages of history, because neither my time nor my knowledge permits me to speak of all races of men and all ages of history. How far the limited conclusions which I shall draw for some races and for some ages are applicable to others must be left to future enquiries to determine. That is my first remark. My second is this. If it can be proved that in certain races and at certain times the institutions {5} in question have been based partly on superstition, it by no means follows that even among these races they have never been based on anything else. On the contrary, as all the institutions which I shall consider have proved themselves stable and permanent, there is a strong presumption that they rest mainly on something much more solid than superstition. No institution founded wholly on superstition, that is on falsehood, can be permanent. If it does not answer to some real human need, if its foundations are not laid broad and deep in the nature of things, it must perish, and the sooner the better. That is my second remark.

II. GOVERNMENT

{6}

[Sidenote: Superstition as a prop of government.] With these two cautions I address myself to my first proposition, which is, that among certain races and at certain times superstition has strengthened the respect for government, especially monarchical government, and has thereby contributed to the establishment and maintenance of civil order.

[Sidenote: Superstitious respect for chiefs in Melanesia.] Among many peoples the task of government has been greatly facilitated by a superstition that the governors belong to a superior order of beings and possess certain supernatural or magical powers to which the governed can make no claim and can offer no resistance. Thus Dr. Codrington tells us that among the Melanesians “the power of chiefs has hitherto rested upon the belief in their supernatural power derived from the spirits or ghosts with which they had intercourse. As this belief has failed, in the Banks’ Islands for example some time ago, the position of a chief has tended to become obscure; and as this belief is now being generally undermined a new kind of chief must needs arise, unless a time of anarchy is to begin.”[6.1] According to a native Melanesian account, the authority of chiefs rests entirely on the belief that they hold communication with mighty ghosts and possess that supernatural power or _mana_, as it is called, whereby they are able to bring the influence of the ghosts to bear on human life. If a chief imposed a fine, it was paid because the people firmly believed that he could inflict calamity and sickness upon such as resisted him. As soon as any considerable number of his {7} subjects began to disbelieve in his influence with the ghosts, his power to levy fines was shaken.[7.1] It is thus that in Melanesia religious scepticism tends to undermine the foundations of civil society.

[Sidenote: Superstitious respect for chiefs in Fiji.] Similarly Mr. Basil Thomson tells us that “the key to the Melanesian system of government is Ancestor-worship. Just as every act in a Fijian’s life was controlled by his fear of Unseen Powers, so was his conception of human authority based upon religion.” The dead chief was supposed still to watch jealously over his people and to punish them with dearth, storms, and floods, if they failed to bring their offerings to his tomb and to propitiate his spirit. And the person of his descendant, the living chief, was sacred; it was hedged in by a magic circle of taboo and might not even be touched without incurring the wrath of the Unseen. “The first blow at the power of the chiefs was struck unconsciously by the missionaries. Neither they nor the chiefs themselves realized how closely the government of the Fijians was bound up with their religion. No sooner had a missionary gained a foothold in a chief village than the tabu was doomed, and on the tabu depended half the people’s reverence for rank. The tabu died hard, as such institutions should do. The first-fruits were still presented to the chief, but they were no longer carried from him to the temple, since their excuse--as an offering to persuade the ancestors to grant abundant increase--had passed away. No longer supported by the priests, the Sacred Chief fell upon evil days”; for in Fiji, as in other places, the priest and the chief, when they were not one and the same person, had played into each other’s hands, both knowing that neither could stand firm without the aid of the other.[7.2]

[Sidenote: Superstitious respect for chiefs in Polynesia generally and in New Zealand particularly.] In Polynesia the state of things was similar. There, too, the power of chiefs depended largely on a belief in their supernatural powers, in their relation to ancestral spirits, and in the magical virtue of taboo, which pervaded their persons and interposed between them and common folk an invisible but formidable barrier, to pass which was death. In New Zealand the Maori chiefs were deemed to be living {8} _atuas_ or gods. Thus the Rev. Richard Taylor, who was for more than thirty years a missionary in New Zealand, tells us that in speaking a Maori chief "assumed a tone not natural to him, as a kind of court language; he kept himself distinct from his inferiors, eating separately; his person was sacred, he had the power of holding converse with the gods, in fact laid claim to being one himself, making the _tapu_ a powerful adjunct to obtain control over his people and their goods. Every means were used to acquire this dignity; a large person was thought to be of the highest importance; to acquire this extra size, the child of a chief was generally provided with many nurses, each contributing to his support by robbing their own offspring of their natural sustenance; thus, whilst they were half-starved, miserable-looking little creatures, the chief's child was the contrary, and early became remarkable by its good appearance. Nor was this feeling confined to the body; the chief was an _atua_, but there were powerful and powerless gods; each naturally sought to make himself one of the former; the plan therefore adopted, was to incorporate the spirits of others with their own; thus, when a warrior slew a chief, he immediately gouged out his eyes and swallowed them, the _atua tonga_, or divinity, being supposed to reside in that organ; thus he not only killed the body, but also possessed himself of the soul of his enemy, and consequently the more chiefs he slew, the greater did his divinity become.… Another great sign of a chief was oratory--a good orator was compared to the _korimako_, the sweetest singing bird in New Zealand; to enable the young chief to become one, he was fed upon that bird, so that he might the better acquire its qualities, and the successful orator was termed a _korimako_."[8.1] Again, another writer informs us that the opinions of Maori chiefs "were held in more estimation than those of others, simply because they were believed to give utterance to the thoughts of deified men. No dazzling pageantry hedged them round, but their persons were sacred.… Many of them believed themselves inspired; {9} thus Te Heu Heu, the great Taupo chief and priest, shortly before he was swallowed up by a landslip, said to a European missionary: 'Think not that I am a man, that my origin is of the earth. I come from the heavens; my ancestors are all there; they are gods, and I shall return to them.'"[9.1] So sacred was the person of a Maori chief that it was not lawful to touch him, even to save his life. A chief has been seen at the point of suffocation and in great agony with a fish bone sticking in his throat, and yet not one of his people, who were lamenting around him, dared to touch or even approach him, for it would have been as much as their own life was worth to do so. A missionary, who was passing, came to the rescue and saved the chief's life by extracting the bone. As soon as the rescued man recovered the power of speech, which he did not do for half an hour, the first use he made of it was to demand that the surgical instruments with which the bone had been extracted should be given to him as compensation for the injury done him by drawing his sacred blood and touching his sacred head.[9.2]

[Sidenote: Superstitious fear of contact with Maori chiefs.] Not only the person of a Maori chief but everything that had come into contact with it was sacred and would kill, so the Maoris thought, any sacrilegious person who dared to meddle with it. Cases have been known of Maoris dying of sheer fright on learning that they had unwittingly eaten the remains of a chief's dinner or handled something that belonged to him. For example, a woman, having partaken of some fine peaches from a basket, was told that they had come from a tabooed place. Immediately the basket dropped from her hands and she cried out in agony that the _atua_ or godhead of the chief, whose divinity had been thus profaned, would kill her. That happened in the afternoon, and next day by twelve o'clock she was dead.[9.3] Similarly a chief's tinder-box has proved fatal to several men; for having found it and lighted their pipes with it {10} they actually expired of terror on learning to whom it belonged.[10.1] Hence a considerate chief would throw away where it could not be found any garment or mat for which he had no further use, lest one of his subjects should find it and be struck dead by the shock of its inherent divinity. For the same reason he would never blow a fire with his mouth; for his sacred breath would communicate its sanctity to the fire, and the fire would pass it on to the meat that might be cooked on it, and the meat would carry it into the stomach of the eater, and he would die.[10.2] Thus the divinity which hedged a Maori chief was a devouring flame which shrivelled up and consumed whatever it touched. No wonder that such men were implicitly obeyed.

[Sidenote: Superstitious respect for chiefs and kings in Tonga and Tahiti.] In the rest of Polynesia the state of things was similar. For example, the natives of Tonga in like manner believed that if any one fed himself with his own hands after touching the sacred person of a superior chief, he would swell up and die; the sanctity of the chief, like a virulent poison, infected the hands of his inferior, and, being communicated through them to the food, proved fatal to the eater, unless he disinfected himself by touching the chief's feet in a particular way.[10.3] When a king of Tahiti entered on office he was girded with a sacred girdle of red feathers, which not only raised him to the highest earthly station, but identified him with the gods.[10.4] Henceforth "every thing in the least degree connected with the king or queen--the cloth they wore, the houses in which they dwelt, the canoes in which they voyaged,

the men by whom they were borne when they journeyed by land, became sacred--and even the sounds in the language, composing their names, could no longer be appropriated to ordinary significations. Hence, the original names of most of the objects with which they were familiar, have from time to time undergone considerable alterations. The ground on which they even accidentally trod, became sacred; and the dwelling under which they might enter, must for ever after be vacated {11} by its proprietors, and could be appropriated only to the use of these sacred personages. No individual was allowed to touch the body of the king or queen; and every one who should stand over them, or pass the hand over their heads, would be liable to pay for the sacrilegious act with the forfeiture of his life. It was on account of this supposed sacredness of person that they could never enter any dwellings, excepting those that were specially dedicated to their use, and prohibited to all others; nor might they tread on the ground in any part of the island but their own hereditary districts."[11.1]

[Sidenote: Superstitious fear of contact with kings in Africa and the Malay region.] In like manner the Cazembes, in the interior of Angola, regarded their king as so holy that no one could touch him without being killed by the magical power which emanated from his sacred person; however, any one who had accidentally or necessarily come into personal contact with his Majesty could escape death by touching the king's hands in a special manner.[11.2] Similar beliefs are current in the Malay region, where the theory of the king as the Divine Man is said to be held perhaps as strongly as in any other part of the world. "Not only is the king's person considered sacred, but the sanctity of his body is believed to communicate itself to his regalia, and to slay those who break the royal taboos. Thus it is firmly believed that any one who seriously offends the royal person, who touches (even for a moment) or who imitates (even with the king's permission) the chief objects of the regalia, or who wrongfully makes use of any of the insignia or privileges of royalty, will be _k■na daulat_, _i.e._ struck dead, by a quasi-electric discharge of that Divine Power which the Malays suppose to reside in the king's person, and which is called _daulat_ or Royal Sanctity."[11.3] [Sidenote: Marvellous powers attributed to rajahs by Malays and Dyaks.] Further, the Malays firmly believe that the king possesses a personal influence over the works of nature, such as the growth of the crops and the bearing of fruit-trees.[11.4] Some of the Hill Dyaks of Sarawak {12} used to bring their seed-rice to Rajah Brooke to be fertilized by him; and once when the rice-crops of a tribe were thin, the chief remarked that it could not be otherwise, since they had not been visited by the Rajah.[12.1] [Sidenote: Superstitious veneration for the rajah of Loowoo.] Among the Toradjas of Central Celebes "the power of the rajah of Loowoo rested for the most part on superstition and on tradition. The ancestors had served the rajah in their day, and should the descendants fail to do so they would have to fear the wrath of the ancestors. Often Toradjas said to us, 'The rajah of Loowoo is our god.' They saw in him the complete embodiment of the old institutions. It used to be said that he had white blood, and the mysterious power that went forth from him was thought to be so great that a common Toradja could not see him without suffering from a swollen belly and dying."[12.2]

[Sidenote: Magical powers attributed to kings in Africa.] Similarly in Africa kings are commonly supposed to be endowed with a magical power of making the rain to fall and the crops to grow: drought and famine are set down to the weakness or ill-will of the king, and accordingly he is punished, deposed, or put to death.[12.3] To take two or three instances out of many, a writer of the eighteenth century speaks as follows of the kingdom of Loango in West Africa: [Sidenote: The king of Loango.] "The government with these people is purely despotic. They say their lives and goods belong to the king; that he may dispose of and deprive them of them when he pleases, without form of process, and without their having anything to complain of. In his presence they pay marks of respect which resemble adoration. The individuals of the lower classes are persuaded that his power is not confined to the earth, and that he has credit enough to make rain fall from heaven: hence they fail not, when a continuance of drought makes them fearful about the harvest, to represent to him that if he does not take care to water the lands of his kingdom, they will die of hunger, and will find it impossible to make him the usual presents. The king, to satisfy the people, without however compromising himself with heaven, {13} devolves the affair on one of his ministers, to whom he gives orders to cause to fall without delay upon the plains as much rain as is wanted to fertilize them. When the minister sees a cloud which he presumes must shed rain, he shews himself in public, as if to exercise the orders of his prince. The women and children troop around him, crying with all their might, _Give us rain, give us rain_: and he promises them some."[13.1] The king of Loango, says another old writer, "is honoured among them as though he were a God: and is called _Sambee_ and _Pango_, which mean God. They believe he can let them have rain when he likes; and once a year, in December, which is the time they want rain, the people come to beg of him to grant it to them, on this occasion they make him presents, and none come empty-handed." On a day appointed, when the chiefs with their troops had assembled in warlike array, the drums used to beat and the horns to sound, and the king shot arrows into the air, which was believed to bring down the rain.[13.2] On the other side of Africa a similar state of things is reported by the old Portuguese historian Dos Santos. [Sidenote: The king of Sofala.] He says: "The king of all these lands of the interior and of the river of Sofala is a woolly-haired Kaffir, a heathen who adores nothing whatever, and has no knowledge of God; on the contrary, he esteems himself the god of all his lands, and is so looked upon and reverenced by his subjects." "When they suffer necessity or scarcity they have recourse to the

king, firmly believing that he can give them all that they desire or have need of, and can obtain anything from his dead predecessors, with whom they believe that he holds converse. For this reason they ask the king to give them rain when it is required, and other favourable weather for their harvest, and in coming to ask for any of these things they bring him valuable presents, which the king accepts, bidding them return to their homes and he will be careful to grant their petitions. They are such barbarians that though they see how often the king {14} does not give them what they ask for, they are not undeceived, but make him still greater offerings, and many days are spent in these comings and goings, until the weather turns to rain, and the Kaffirs are satisfied, believing that the king did not grant their request until he had been well bribed and importuned, as he himself affirms, in order to maintain them in their error."[14.1] Nevertheless "it was formerly the custom of the kings of this land to commit suicide by taking poison when any disaster or natural physical defect fell upon them, such as impotence, infectious disease, the loss of their front teeth by which they were disfigured, or any other deformity or affliction. To put an end to such defects they killed themselves, saying that the king should be free from any blemish." However, in the time of Dos Santos the king of Sofala, in defiance of all precedent, persisted in living and reigning after he had lost a front tooth; and he even went so far as to tax his royal predecessors with folly for having made away with themselves for such trifles as a decayed tooth or a little grey hair, declaring his firm resolution to live as long as he possibly could for the benefit of his loyal subjects.[14.2] [Sidenote: The chief medicine-man of the Nandi.] At the present day the principal medicine-man of the Nandi, a tribe in British East Africa, is also supreme chief of the whole people. He is a diviner, and foretells the future: he makes women and cattle fruitful; and in time of drought he obtains rain either directly or through the intervention of the rainmakers. The Nandi believe implicitly in these marvellous powers of their chief. His person is usually regarded as absolutely sacred. Nobody may approach him with weapons in his hand or speak in his presence unless he is first addressed; and it is deemed most important that nobody should touch the chief's head, otherwise his powers of divination and so forth would depart from him.[14.3] This widespread African conception of the divinity of kings culminated long ago in ancient Egypt, where the kings were treated as gods both in life and in death, temples being dedicated to their worship {15} and priests appointed to conduct it.[15.1] And when the harvests failed, the ancient Egyptians, like the modern negroes, laid the blame of the failure on the reigning monarch.[15.2]

[Sidenote: Superstitious veneration of the Peruvians for the Yncas.] A halo of superstitious veneration also surrounded the Yncas or governing class in ancient Peru. Thus the old historian Garcilasso de la Vega, himself the son of an Ynca princess, tells us that "it does not appear that any Ynca of the blood royal has ever been punished, at least publicly, and the Indians deny that such a thing has ever taken place. They say that the Ynca never committed any fault that required correction; because the teaching of their parents, and the common opinion that they were children of the Sun, born to teach and to do good to the rest of mankind, kept them under such control, that they were rather an example than a scandal to the commonwealth. The Indians also said that the Yncas were free from the temptations which usually lead to crime, such as passion for women, envy and covetousness, or the thirst for vengeance; because if they desired beautiful women, it was lawful for them to have as many as they liked; and any pretty girl they might take a fancy to, not only was never denied to them, but was given up by her father with expressions of extreme thankfulness that an Ynca should have condescended to take her as his servant. The same thing might be said of their property; for, as they never could feel the want of anything, they had no reason to covet the goods of others; while as governors they had command over all the property of the Sun and of the Ynca; and those who were in charge, were bound to give them all that they required, as children of the Sun, and brethren of the Ynca. They likewise had no temptation to kill or wound any one either for revenge, or in passion; for no one ever offended them. On the contrary, they received adoration only second to that offered to the royal person; and if any one, how high soever his rank, had enraged any Ynca, it would have been looked upon as sacrilege, and very severely punished. But it may be affirmed that an Indian {16} was never punished for offending against the person, honour, or property of any Ynca, because no such offence was ever committed, as they held the Yncas to be like gods."[16.1]

[Sidenote: Superstitious veneration for kings in ancient India.] Nor have such superstitions been confined to savages and other peoples of alien race in remote parts of the world. They seem to have been shared by the ancestors of all the Aryan peoples from India to Ireland. Thus in the ancient Indian law-book called the Laws of Manu, we read: "Because a king has been formed of particles of those lords of the gods, he therefore surpasses all created beings in lustre; and, like the sun, he burns eyes and hearts; nor can anybody on earth even gaze on him. Through his (supernatural) power he is Fire and Wind, he Sun and Moon, he the Lord of justice (Yama), he Kubera, he Varuna, he great Indra. Even an infant king must not be despised (from an idea) that he is a (mere) mortal; for he is a great deity in human form."[16.2] And in the same law-book the effects of a good king's reign are thus described: "In that (country) where the king avoids taking the property of (mortal) sinners, men are born in (due) time (and are) long-lived. And the crops of the husbandmen spring up, each as it was sown, and the children die not, and no misshaped (offspring) is born."[16.3]

[Sidenote: Superstitious veneration for kings in ancient Europe.] Similarly in Homeric Greece, kings and chiefs were described as sacred or divine; their houses, too, were divine, and their chariots sacred;[16.4] and it was thought that the reign of a good king caused the black earth to bring forth wheat and barley, the trees to be loaded with fruit, the flocks to multiply, and the sea to yield fish.[16.5] When the crops failed, the Burgundians used to blame their kings and depose them.[16.6] Similarly the Swedes always ascribed the abundance or scantiness of the harvest to the goodness or badness of their kings, and in time of dearth they have been known {17} to sacrifice them to the gods for the sake of procuring good crops.[17.1] In ancient Ireland it was also believed that when kings observed the customs of their ancestors the seasons were mild, the crops plentiful, the cattle fruitful, the waters abounded with fish, and the fruit-trees had to be propped up on account of the weight of their produce. A canon ascribed to St. Patrick enumerates among the blessings that attend the reign of a just king “fine weather, calm seas, crops abundant, and trees laden with fruit.”[17.2] [Sidenote: Survivals of the superstition in Scotland.] Superstitions of the kind which were thus current among the Celts of Ireland centuries ago appear to have survived among the Celts of Scotland down to Dr. Johnson’s time; for when he travelled in Skye it was still held that the return of the chief of the Macleods to Dunvegan, after any considerable absence, produced a plentiful catch of herring;[17.3] and at a still later time, when the potato crop failed, the clan Macleod desired that a certain fairy banner in the possession of their chief might be unfurled,[17.4] apparently in the belief that the magical banner had only to be displayed to produce a fine crop of potatoes.

[Sidenote: Touching for the King’s Evil.] Perhaps the last relic of such superstitions which lingered about our English kings was the notion that they could heal scrofula by their touch. The disease was accordingly known as the King’s Evil;[17.5] and on the analogy of the Polynesian superstitions which I have cited, we may perhaps conjecture that the skin disease of scrofula was originally supposed to be caused as well as cured by the king’s touch. Certain it is that in Tonga some forms of scrofula, as well as indurations of the liver, to which the natives were very subject, were thought to be caused by touching a chief and {18} to be healed, on homœopathic principles, in the very same fashion.[18.1] Similarly in Loango palsy is called the king’s disease, because the negroes imagine it to be heaven’s own punishment for treason meditated against the king.[18.2] The belief in the king’s power to heal by touch is known to have been held both in France and England from the eleventh century onward. The first French king to touch the sick appears to have been Robert the Pious, the first English king Edward the Confessor.[18.3] In England the belief that the king could heal scrofula by his touch survived into the eighteenth century. Dr. Johnson was touched in his childhood for scrofula by Queen Anne.[18.4] It is curious that so typical a representative of robust common sense as Dr. Johnson should in his childhood and old age have thus been brought into contact with these ancient superstitions about royalty both in England and Scotland. In France the superstition lingered a good deal longer, for whereas Queen Anne was the last reigning monarch in England to touch for scrofula, both Louis XV. and Louis XVI. at their coronation touched thousands of patients, and as late as 1824 Charles X. at his coronation went through the same solemn farce. It is said that the sceptical wits of Louis XVI.’s time investigated all the cases of the persons on whom the king had laid hands at his coronation, with the result that out of two thousand four hundred who were touched only five were made whole.[18.5]

[Sidenote: Conclusion.] The foregoing evidence, summary as it is, may suffice to prove that many peoples have regarded their rulers, whether chiefs or kings, with superstitious awe as beings of a higher order and endowed with mightier powers than common folk. Imbued with such a profound veneration for their governors and with such an exaggerated conception of their power, they cannot but have yielded them a prompter and more implicit obedience than if they had {19} known them to be men of common mould just like themselves. If that is so, I may claim to have proved my first proposition, which is, that among certain races and at certain times superstition has strengthened the respect for government, especially monarchical government, and has thereby contributed to the establishment and maintenance of civil order.

III. PRIVATE PROPERTY

{20}

[Sidenote: Superstition as a prop of private property.] I pass now to my second proposition, which is, that among certain races and at certain times superstition has strengthened the respect for private property, and has thereby contributed to the security of its enjoyment.

[Sidenote: Taboo in Polynesia.] Nowhere, perhaps, does this appear more plainly than in Polynesia, where the system of taboo reached its highest development; for the effect of tabooing a thing was, in the opinion of the natives, to endow it with a supernatural or magical energy which rendered it practically unapproachable by any but the owner. Thus taboo became a powerful instrument for strengthening the ties, perhaps our socialist friends would say riveting the chains, of private property. Indeed, some good

authorities who were personally acquainted with the working of taboo in Polynesia, have held that the system was originally devised for no other purpose. [Sidenote: Taboo among the Maoris of New Zealand.] For example, an Irishman who lived as a Maori with the Maoris for years, and knew them intimately, writes as follows: “The original object of the ordinary _tapu_ seems to have been the preservation of property. Of this nature in a great degree was the ordinary personal _tapu_. This form of the _tapu_ was permanent, and consisted in a certain sacred character which attached to the person of a chief and never left him. It was his birthright, a part in fact of himself, of which he could not be divested, and which was well understood and recognized at all times as a matter of course. The fighting men and petty chiefs, and every one indeed who could by any means claim the title of _rangatira_--which in the sense I now use it means gentleman--were all in {21} some degree more or less possessed of this mysterious quality. It extended or was communicated to all their moveable property, especially to their clothes, weapons, ornaments, and tools, and to everything in fact which they touched. This prevented their chattels from being stolen or mislaid, or spoiled by children, or used or handled in any way by others. And as in the old times, as I have before stated, every kind of property of this kind was precious in consequence of the great labour and time necessarily, for want of iron tools, expended in the manufacture, this form of the _tapu_ was of great real service. An infringement of it subjected the offender to various dreadful imaginary punishments, of which deadly sickness was one.” The culprit was also liable to what may be called a civil action, which consisted in being robbed and beaten; but the writer whom I have just quoted tells us that the worst part of the punishment for breaking taboo was the imaginary part, since even when the offence had been committed unwittingly the offender has been known to die of fright on learning what he had done.[21.1] Similarly, another writer, speaking of the Maoris, observes that “violators of the _tapu_ were punished by the gods and also by men. The former sent sickness and death; the latter inflicted death, loss of property, and expulsion from society. It was a dread of the gods, more than of men, which upheld the _tapu_. Human eyes might be deceived, but the eyes of the gods could never be deceived.”[21.2] “The chiefs, as might be expected, are fully aware of the advantages of the _tapu_, finding that it confers on them, to a certain extent, the power of making laws, and the superstition on which the _tapu_ is founded will ensure the observance of them. Were they to transgress the _tapu_, they believe that the _attua_ (God) would kill them, and so universal is this belief that it is, or rather was, a very rare occurrence to find any one daring enough to commit the {22} sacrilege. To have preserved this influence so completely among a people naturally so shrewd and intelligent, great care must, no doubt, have been taken not to apply it unless in the usual and recognised manner. To have done otherwise would have led to its being frequently transgressed; and consequently to the loss of its influence. Before the natives came into contact with the Europeans the _tapu_ seems to have acted with the most complete success; as the belief was general, that any disregard of it would infallibly subject the offender to the anger of the _attua_, and death would be the consequence. Independently, however, of the support which the _tapu_ derives from the superstitious fears of these people, it has, like most other laws, an appeal to physical force in case of necessity. A delinquent, if discovered, would be stripped of everything he possessed; and if a slave, would in all probability be put to death--many instances of which have actually occurred. So powerful is this superstitious feeling, that slaves will not venture to eat of the same food as their master; or even to cook at the same fire; believing that the _attua_ would kill them if they did so. Everything about, or belonging to, a chief is accounted sacred by the slaves. Fond as they are of tobacco, it would be perfectly secure though left exposed on the roof of a chief’s house; no one would venture to touch it. To try them, a friend of mine gave a fig of tobacco to a slave; who, after having used it, was informed that it had been on the roof of the chief’s house. The poor fellow, in the greatest consternation, went immediately to the chief telling him what had happened, and beseeching him to take off the _tapu_ from the tobacco to prevent the evil consequences.”[22.1]

[Sidenote: Taboo as a preserver of property.] Hence it has been truly said that “this form of _tapu_ was a great preserver of property. The most valuable articles might, in ordinary circumstances, be left to its protection, in the absence of the owners, for any length of time.”[22.2] If any one wished to preserve his crop, his house, his garments, or anything else, he had only to taboo the property, and it was safe. To shew that the thing was tabooed, he put a mark {23} to it. Thus, if he wished to use a particular tree in the forest to make a canoe, he tied a wisp of grass to the trunk; if he desired to appropriate a patch of bulrush in a swamp, he stuck up a pole in it with a bunch of grass at the top; if he left his house with all its valuables, to take care of itself, he secured the door with a bit of flax, and the place straightway became inviolable, nobody would meddle with it.[23.1]

Hence although the restrictions imposed by taboo were often vexatious and absurd, and the whole system has sometimes been denounced by Europeans as a degrading superstition, yet observers who looked a little deeper have rightly perceived that its enactments, enforced mainly by imaginary but still powerful sanctions, were often beneficial. “The New Zealanders,” says one writer, “could not have been governed without some code of laws analogous to the _tapu_. Warriors submitted to the supposed decrees of the gods who would have spurned with contempt the orders of men, and it was better the people should be ruled by superstition than by brute force.”[23.2] Again, an experienced missionary, who knew the Maoris well, writes that “the _tapu_ in

many instances was beneficial; considering the state of society, absence of law, and fierce character of the people, it formed no bad substitute for a dictatorial form of government, and made the nearest approach to an organized state of society."[23.3]

[Sidenote: Taboo in the Marquesas Islands.] In other parts of Polynesia the system of taboo with its attendant advantages and disadvantages, its uses and abuses, was practically the same, and everywhere, as in New Zealand, it tightened for good or evil the ties of private property. This indeed was perhaps the most obvious effect of the institution. In the Marquesas Islands, it is said, taboo was invested with a divine character as the expression of the will of the gods revealed to the priests; as such it set bounds to injurious excesses, prevented depredations, and united the people. Especially it converted the tabooed or privileged classes into landed proprietors; the land belonged to them alone and to their heirs; common {24} folk lived by industry and by fishing. Taboo was the bulwark of the landowners; it was that alone which elevated them by a sort of divine right into a position of affluence and luxury above the vulgar; it was that alone which ensured their safety and protected them from the encroachments of their poor and envious neighbours. "Without doubt," say the writers from whom I borrow these observations, "the first mission of taboo was to establish property, the base of all society."[24.1]

[Sidenote: Superstitious fear as a preserver of property in Samoa.] In Samoa also superstition played a great part in fostering a respect for private property. That it did so, we have the testimony of a missionary, Dr. George Turner, who lived for many years among the Samoans and has given us a very valuable account of their customs. He says: "I hasten to notice the second thing which I have already remarked was an auxiliary towards the maintenance of peace and order in Samoa, viz. _superstitious fear_. If the chief and heads of families, in their court of inquiry into any case of stealing, or other concealed matter, had a difficulty in finding out the culprit, they would make all involved swear that they were innocent. In swearing before the chiefs the suspected parties laid a handful of grass on the stone, or whatever it was, which was supposed to be the representative of the village god, and laying their hand on it, would say, 'In the presence of our chiefs now assembled, I lay my hand on the stone. If I stole the thing may I speedily die.' This was a common mode of swearing. The meaning of the grass was a silent additional imprecation that his family might all die, and that _grass_ might grow over their habitation. If all swore, and the culprit was still undiscovered, the chiefs then wound up the affair by committing the case to the village god, and solemnly invoking him to mark out for speedy destruction the guilty {25} mischief-maker. But, instead of appealing to the chiefs, and calling for an oath, many were contented with their own individual schemes and imprecations to frighten thieves and prevent stealing. When a man went to his plantation and saw that some cocoa-nuts, or a bunch of bananas, had been stolen, he would stand and shout at the top of his voice two or three times, 'May fire blast the eyes of the person who has stolen my bananas! May fire burn down his eyes and the eyes of his god too!' This rang throughout the adjacent plantations, and made the thief tremble. They dreaded such uttered imprecations.… But there was another and more extensive class of curses, which were also feared, and formed a powerful check on stealing, especially from plantations and fruit trees, viz. the silent hieroglyphic taboo, or _tapui_ (_tapooe_), as they call it. Of this there was a great variety."[25.1]

[Sidenote: Samoan taboos.] Among the Samoan taboos which were employed for the protection of property were the following:--1. _The sea-pike taboo_. To prevent his bread-fruits from being stolen a man would plait some coco-nut leaflets in the form of a sea-pike and hang one or more such effigies from the trees which he wished to protect. Any ordinary thief would be afraid to touch a tree thus guarded, for he believed that if he stole the fruit a sea-pike would mortally wound him the next time he went to sea. 2. _The white-shark taboo_. A man would plait a coco-nut leaf in the shape of a shark and hang it on a tree. This was equivalent to an imprecation that the thief might be devoured by a shark the next time he went to fish. 3. _The cross-stick taboo_. This was a stick hung horizontally on the tree. It expressed a wish that whoever stole fruit from the tree might be afflicted with a sore running right across his body till he died. 4. _The ulcer taboo_. This was made by burying some pieces of clam-shell in the ground and setting up at the spot several reeds tied together at the top in a bunch like the head of a man. By this the owner signified his wish that the thief might be laid low with ulcerous sores all over his body. If the thief happened thereafter to be troubled with swellings or sores, he confessed his fault and sent a present to the {26} owner of the land, who in return sent to the culprit a herb both as a medicine and as a pledge of forgiveness. 5. _The thunder taboo_. A man would plait coco-nut leaflets in the form of a small square mat and suspend it from a tree, adding some white streamers of native cloth. A thief believed that for trespassing on such a tree he or his children might be struck by lightning, or perhaps that lightning might strike and blast his own trees. "From these few illustrations," says Dr. Turner in conclusion, "it will be observed that Samoa formed no exception to the remarkably widespread system of superstitious taboo; and the extent to which it preserved honesty and order among a heathen people will be readily imagined."[26.1]

[Sidenote: Taboo in Tonga.] In Tonga a man guilty of theft or of any other crime was said to have broken the taboo, and as such persons were supposed to be particularly liable to be bitten by sharks, all on whom suspicion fell were compelled to go into water frequented by sharks; if they were bitten or devoured, they were guilty; if they escaped, they were innocent.[26.2]

[Sidenote: Taboo in Melanesia.] In Melanesia also a system of taboo (_tambu_, _tapu_) exists; it is described as “a prohibition with a curse expressed or implied,” and derives its sanction from a belief that the chief or other person who imposes a taboo has the support of a powerful ghost or spirit (_tindalo_). If a common man took it upon himself to taboo anything, people would watch to see whether a transgressor of the taboo fell sick; if he did, it was a proof that the man who imposed the taboo was backed by a powerful ghost, and his reputation would rise accordingly. Each ghost affected a particular sort of leaf, which was his taboo mark.[26.3] In New Britain plantations, coco-nut trees, and other possessions are protected against thieves by marks of taboo attached to them, and it is thought that whoever violates the taboo will be visited by sickness or other misfortune. The nature of the sickness or misfortune varies with that of the mark or magical object which embodies the mystic virtue of the taboo. One plant used for this purpose will cause the {27} thief’s head to ache; another will make his thighs swell; another will break his legs; and so forth. Even the murmuring of a spell over a fence is believed to ensure that whoever steals sticks from the fence will have a swollen head.[27.1] In Fiji the institution of taboo was the secret of power and the strength of despotic rule. It was wondrously diffused, affecting things great and small. Here it might be seen tending a brood of chickens and there directing the energies of a kingdom. The custom was much in favour with the chiefs, who adjusted it so that it sat lightly on them and heavily on others. By it they gained influence, supplied their wants, and commanded at will their inferiors. In imposing a taboo a chief need only be checked by a regard for ancient precedent. Inferior persons endeavoured by the help of the system to put their yam-beds and plantain-plots within a sacred pale.[27.2]

[Sidenote: Taboo in the Malay Archipelago.] A system of taboo based on superstition prevails all over the islands of the Malay Archipelago, where the common term for taboo is _pamali_, _pomali_, or _pemali_, though in some places other words, such as _poso_, _potu_, or _boboso_ are in use to express the same idea.[27.3] In this great region also the superstition associated with taboo is a powerful instrument to enforce the rights of private property. Thus, in the island of Timor “a prevalent custom is the _pomali_, exactly equivalent to the ‘taboo’ of the Pacific islanders, and equally respected. It is used on the commonest occasions, and a few palm leaves stuck outside a garden as a sign of the _pomali_ will preserve its produce from thieves as effectually as the threatening notice of man-traps, spring guns, or a savage dog, would do with us.”[27.4] In Amboyna the word for taboo is _pamali_. A man who wishes to protect his fruit-trees or other possessions against theft may do it in various ways. For example, he may make a white cross on a pot {28} and hang the pot on the fruit-tree; then the thief who steals fruit from that tree will be a leper. Or he may place the effigy of a mouse under the tree; then the thief will have marks on his nose and ears as if a mouse had gnawed them. Or he may plait dry sago leaves into two round discs and tie them to the tree; then the thief’s body will swell up and burst.[28.1] In Ceram the methods of protecting property from thieves are similar. For example, a man places a pig’s jaw in the branches of his fruit-tree; after that any person who dares to steal the fruit from the tree will be rent in pieces by a wild boar. The image of a crocodile with a thread of red cotton tied round its neck will be equally efficacious; the thief will be devoured by a crocodile. A wooden effigy of a snake will make the culprit to be stung by a serpent. A figure of a cat with a red band round its neck will cause all who approach the tree with evil intentions to suffer from excruciating pains in their stomachs, as if a cat were clawing their insides.[28.2] An image of a swallow will cause the thief to suffer as if a swallow were pecking his eyes out: a piece of thorny wood and a red spongy stone will inflict piercing pangs on him and make his whole body to be red and pitted with minute holes: a burnt-out brand will cause his house to burst into flames, without any apparent reason; and so on.[28.3] Similarly in the Ceram Laut Islands a man protects his coco-nut trees or sago palms by placing charmed objects at the foot of them. For example, he puts the effigy of a fish under his coco-nut tree and says, “Grandfather fish, cause the person who steals my coco-nuts to be sick and vomit.” The culprit accordingly is seized with pains in his stomach and can only be relieved of them by the owner of the coco-nuts, who spits betel-nut juice on the ailing part and blows into the sufferer’s ear, saying, “Grandfather fish, return to the sea. You have there room enough and great rocks of coral where you can {29} swim about.” Or again he may make a miniature coffin and place it on the ground under the tree; then the thief will suffer from shortness of breath and a feeling of suffocation, as if he were actually shut up in a coffin. And many other devices there are whereby in these islands the owner of fruit-trees protects the fruit from the depredations of his unscrupulous neighbours. In every case he deposits at the foot of the tree or fastens to the trunk a charmed object, which he regards as endowed with supernatural powers, and he invokes its aid to guard his possessions.[29.1]

[Sidenote: Charms for the protection of fruit-trees in Central Celebes.] The Bare’e-speaking Toradjas of Central Celebes protect their fruit-trees, especially their sirih plants and their coco-nut palms against thieves by amulets or charms of various sorts which they attach to the trees. The charms consist of the leaves of certain plants or parts of an animal tied up in leaves. Before the owner fastens one of these amulets to the tree, he says, “O charm (_ooroo_), if any man will take of these fruits, make him sick.” And the people in general believe that sickness will overtake the thief who disregards the taboo and steals the fruit. The kind of sickness or other mishap which will visit the sinner varies with the nature of the charm. The qualities of the object which is fastened to the tree

are supposed to enter into the culprit's body and to affect him accordingly. For example, if the charm consists of a particular sharp-edged grass, then the thief will feel sharp pains in his body; if it is part of a white ant heap, he will be afflicted with leprosy; if it is a certain weed of which the fruit drops off easily, his teeth will fall out; if it is a plant whose leaves cause itching, his body will itch all over; if it is the _dracaena terminalis_, he will be killed in war; and so on. There is a great variety of these amulets for the protection of fruit-trees; every man has his own in which he puts his trust. Yet while the Toradjas believe that sickness or other misfortune follows automatically the breach of such taboos, nevertheless they allege that they know how to evade the force and vigilance of the charm and to eat of the forbidden fruit with impunity. One of the expedients adopted for that purpose is as follows. You take a handful of earth and throw it at the tree; then with {30} your chopping-knife you chip a splinter from the trunk, and addressing the protective charm you say, "Make the earth sick first, and then the chopping-knife, and then me." After that you have practically nothing to fear from the amulet, and you can steal the fruit and eat it at your ease. But that is not all. Some artful thieves are able not merely to counteract the charm and render it powerless against themselves; they can even reverse its action and direct it against the owner of the tree himself. Indeed, so well-recognized is this power that many a prudent Toradja refuses to protect his trees with amulets at all, lest in doing so he should be simply putting in the hands of his enemies a weapon to be used by them for his own destruction. One of the ways in which a cunning robber will thus defeat the ends of justice is this. He goes boldly up to the fruit-tree which he intends to rob, removes the charm from it, and hangs it up somewhere else. Then he lays a plank on the ground with one end of it touching the trunk of the fruit-tree; on this plank he walks up to the tree and calmly appropriates the fruit. The charm, of course, in the meantime is helpless, since it is not on the tree. When he has stripped the fruit, the rascal restores the charm to its proper place and removes the plank. Again, the guardian charm is helpless; it cannot pursue the thief, since he has carried away the plank, leaving no possible exit from the tree. Thus the faithful guardian is, as it were, imprisoned in the castle which he has been set to guard; he frets and fumes at his confinement, and in his blind rage will fall foul of the owner of the tree himself when next he comes to inspect his property. This is, perhaps, the simplest and easiest mode of hoisting a fruit-farmer with his petard. There are, however, other ways of doing it. One of them is to get up into the tree and hang by your feet from a branch with your head down, and, while thus suspended in the air, to chew the root of a stinging nettle. This causes the owner of the tree either to be eaten up by a crocodile or to perish in war. A very popular charm among the Mountain Toradjas of Central Celebes is to take the head or paw of an iguana and hang it on the fruit-tree which is to be protected. The head bites the thief's head, and the paw grabs him by the {31} leg, so that he feels excruciating pains in these portions of his frame. But if you hang up the whole carcase, the thief is a dead man.[31.1]

[Sidenote: Taboo (_fady_) in Madagascar.] In Madagascar there is an elaborate system of taboo known as _fady_.[31.2] It has been carefully studied in a learned monograph by Professor A. van Gennep,[31.3] who argues that originally all property was based on religion, and that marks of property were marks of taboo.[31.4] However, so far as the evidence permits us to judge, it does not appear that the system has been used by the Malagasy for the protection of property to the same extent as by the Polynesians, the Melanesians, and the Indonesians. But we hear of Malagasy charms placed in the fields to afflict with leprosy and other maladies any persons who should dare to steal from them.[31.5] And we are told that some examples of _fady_ or taboo "seem to imply a curious basis for the moral code in regard to the rights of property among the last generation of Malagasy. It does not appear to have been _fady_ to steal in general, but certain articles were specified, to steal which there were various penalties attached. Thus, to steal an egg caused the thief to become leprous; to steal _landy_ (native silk) caused blindness or some other infirmity. And to steal iron was also visited by some bodily affliction."[31.6] In order to recover stolen property the Malagasy had recourse to a deity called Ramanandroany. The owner would take a remnant of the thing that had been purloined, and going with it to the idol would say, "As to whoever stole our property, O Ramanandroany, kill him by day, destroy him by night, and strangle him; let there be none amongst men like him; let him not be able to increase in riches, not even a farthing, but let him pick up his livelihood as a hen pecks rice-grains; let his eyes be blinded, and his knees swollen, {32} O Ramanandroany." It was supposed that these curses fell on the thief.[32.1]

[Sidenote: Property protected by superstitious fears elsewhere.] Similar modes of enforcing the rights of private property by the aid of superstitious fears have been adopted in many other parts of the world. The subject has been copiously illustrated by Dr. Edward Westermarck in his very learned work on the origin and development of the moral ideas.[32.2] Here I will cite only a few cases out of many. The Kouis of Laos, on the borders of Siam, protect their plantations against thieves in a very simple way. They place a "shaking tubercule" (_prateal anchot_) on the land which is to be guarded; and if any thief should thereafter dare to lay hands on the crop, he is immediately seized by a shaking fit like that of a drenched dog and cannot budge from the spot. They say that a fisherman at Sangkeah employed this charm with the best results. He used always to find his bow-net empty till one day he had the happy thought of protecting it by a "shaking tubercule." It acted like magic. The thief went down as usual into the river and brought

up the net full of fish. But hardly had he stepped on the bank when he began to shiver and shake, with the dripping net and its writhing silvery contents glued to his breast. Two days afterwards, the proprietor, making his rounds, discovered the thief on the same spot, shivering and chattering away as hard as {33} ever, but of course the fish in the net were dead and rotten.[33.1] Among the Kawars, a primitive hill tribe of the Central Provinces in India, “the sword, the gun, the axe, the spear have each a special deity, and in fact in the Bangawan, the tract where the wilder Kawars dwell, it is believed that every article of household furniture is the residence of a spirit, and that if any one steals or injures it without the owner’s leave the spirit will bring some misfortune on him in revenge. Theft is said to be unknown among them, partly on this account and partly perhaps because no one has much property worth stealing.”[33.2] In Ceylon, when a person wishes to protect his fruit-trees from thieves, he hangs up certain grotesque figures round the orchard and dedicates it to the devils. After that no native will dare to touch the fruit; even the owner himself will not venture to use it till the charm has been removed by a priest, who naturally receives some of the fruit for his trouble.[33.3] The Indians of Cumana in South America surrounded their plantations with a single cotton thread, and this was safeguard enough; for it was believed that any trespasser would soon die. The Juris of Brazil adopt the same simple means of stopping gaps in their fences.[33.4]

[Sidenote: Property in Annam protected by ghosts and curses.] The Annamites in the interior of Tonquin believe that the ghosts of young girls who have been buried in a corner of the dwelling act as a vigilant police; if thieves have made their way into the house and are preparing to depart with their booty, they hear the voice of a ghost enumerating the things on which they have laid hands, and in a panic they drop them and take to flight.[33.5] But if in spite of all an Annamite should chance to be robbed, he can easily recover the stolen property as follows. With a clod of earth taken from the kitchen floor, a pinch of vermilion, the white of an egg, and a little alcohol he makes a ball, which stands for the head of the thief. This he puts in the fire on {34} the hearth, and having lit some incense sticks he pronounces the following incantation: “On such a day of such a month of such a year So-and-so was robbed of various things. The name of the thief is unknown. I pray the guardian-spirit of the kitchen to hold the rascal’s head in the fire that it may burn.” After that, if the thief does not restore the stolen property, he will be a dead man within a month.[34.1]

[Sidenote: Thieves cursed in Nias.] Similarly in Nias, an island to the west of Sumatra, when a thief cannot be found he is cursed, and to give weight to the curse a dog is burned alive. While the animal is expiring in torments, the man who has been robbed expresses his wish that the thief may likewise die in agony; and they say that thieves who have been often cursed do die screaming.[34.2] [Sidenote: Thieves cursed among the Sea Dyaks of Borneo.] Curses are also employed for the same purpose with excellent effect by the Sea Dyaks of Borneo. On this point a missionary bears the following testimony. “With an experience of nearly twenty years in Borneo, during which I came into contact with thousands of the people, I have known of only two instances of theft among the Dyaks. One was a theft of rice. The woman who lost the rice most solemnly and publicly cursed the thief, whoever it might be. The next night the rice was secretly left at her door. The other was a theft of money. In this case, too, the thief was cursed. The greater part of the money was afterwards found returned to the box from which it had been abstracted. Both these incidents show the great dread the Dyak has of a curse. Even an undeserved curse is considered a terrible thing, and, according to Dyak law, to curse a person for no reason at all is a fineable offence.

“A Dyak curse is a terrible thing to listen to. I have only once heard a Dyak curse, and I am sure I do not want to do so again. I was travelling in the Saribas district, and at that time many of the Dyaks there had gone in for coffee-planting; indeed, several of them had started coffee plantations on a small scale. A woman told me that some one had over and over again stolen the ripe coffee-berries from her plantation. Not only were the ripe berries stolen, but the thief had carelessly picked many of the young berries and {35} thrown them on the ground, and many of the branches of the plants had been broken off. In the evening, when I was seated in the public part of the house with many Dyak men and women round me, we happened to talk about coffee-planting. The woman was present, and told us of her experiences, and how her coffee had been stolen by some thief, who, she thought, must be one of the inmates of the house. Then she solemnly cursed the thief. She began in a calm voice, but worked herself up into a frenzy. We all listened horror-struck, and no one interrupted her. She began by saying what had happened, and how these thefts had gone on for some time. She had said nothing before, hoping that the thief would mend his ways; but the matter had gone on long enough, and she was going to curse the thief, as nothing, she felt sure, would make him give up his evil ways. She called on all the spirits of the waters and the hills and the air to listen to her words and to aid her. She began quietly, but became more excited as she went on. She said something of this kind:

[Sidenote: Curses on a man thief.] “‘If the thief be a man, may he be unfortunate in all he undertakes! May he suffer from a disease that does not kill him, but makes him helpless--always in pain--and a burden to others. May his wife be unfaithful to him, and his children become as lazy and dishonest as he is himself. If he go out on the war-path, may he be killed, and his head smoked over

the enemy's fire. If he be boating, may his boat be swamped and may he be drowned. If he be out fishing, may an alligator kill him suddenly, and may his relatives never find his body. If he be cutting down a tree in the jungle, may the tree fall on him and crush him to death. May the gods curse his farm so that he may have no crops, and have nothing to eat, and when he begs for food, may he be refused, and die of starvation.

[Sidenote: Curses on a woman thief.] "'If the thief be a woman, may she be childless, or if she happen to be with child let her be disappointed, and let her child be still-born, or, better still, let her die in childbirth. May her husband be untrue to her, and despise her and ill-treat her. May her children all desert her if she live to grow old. May she suffer from such diseases as are peculiar to women, and may her eyesight grow dim as the years go {36} on, and may there be no one to help her or lead her about when she is blind.'

"I have only given the substance of what she said; but I shall never forget the silence and the awed faces of those who heard her. I left the house early next morning, so I do not know what was the result of her curse--whether the thief confessed or not."[36.1]

[Sidenote: Thieves cursed in ancient Greece.] The ancient Greeks seem to have made a very liberal use of curses as a cheap and effective mode of protecting property, which dispenses the injured party from resorting to the tedious, expensive, and too often fruitless formalities of the law. These curses they inscribed on tablets of lead and other materials and deposited either in the place which was to be protected from depredation or in the temple of the god to whose tender mercies the criminal was committed. For example, in a sacred precinct dedicated to Demeter, Persephone, Pluto and other deities of a stern and inflexible temper at Cnidus, a number of leaden tablets were found inscribed with curses which consigned the malefactors of various sorts to the vengeance of the two Infernal Goddesses, Demeter and her daughter. "May he or she never find Persephone propitious!" is the constantly repeated burden of these prayers; and in some of them the sinner is not only excommunicated in this world but condemned to eternal torments in the world hereafter. Often the persons who launched these curses were ladies. One irate dame consigns to perdition the thief who had stolen her bracelet or the defaulter who had failed to send back her underclothes.[36.2] Another curse, engraved on a marble slab found at Smyrna, purports that if any man should steal one of the sacred vessels of a certain goddess or injure her sacred fish, he may die a painful death, devoured by the fishes.[36.3] Sometimes, apparently, these Greek imprecations {37} were as effective in reclaiming sinners as Dyak curses are to this day. Thus we read of a curious dedication to a lunar deity of Asia Minor, by name Men Aziottenos, which declares how one Artemidorus, having been reviled by a couple of rude fellows, cursed them in a votive tablet, and how one of the culprits, having been punished by the god, made a propitiatory offering and mended his wicked ways.[37.1] [Sidenote: Landmarks protected by gods and curses.] To prevent people from encroaching on their neighbours' land by removing the boundary stones, the Greeks committed landmarks to the special protection of the great god Zeus;[37.2] and Plato dwells with unction on the double punishment, divine and human, to which the sinner exposed himself who dared to tamper with these sacred stones.[37.3] The Romans went even further, for they created a god for the sole purpose of looking after landmarks, and he must have had his hands very full if he executed all the curses which were levelled not only at every man who shifted his neighbour's boundary stone, but even at the oxen which he employed to plough up his neighbour's land.[37.4] The Hebrew code of Deuteronomy pronounced a solemn curse on such as removed their neighbour's landmarks;[37.5] and Babylonian kings exhausted their imagination in pouring out a flood of imprecations against the abandoned wretch who thus set at naught the rights of property in land.[37.6] King Nebuchadnezzar in particular, before he was turned out to grass, appears to have distinguished himself by the richness and variety of his execrations, if we may judge by a specimen of them which has survived. A brief extract from this masterpiece may serve to illustrate the king's style of minatory eloquence. Referring to the bold bad man, "be it shepherd or governor, or agent or regent, levy master or magistrate," whosoever he might be, who "for all days to {38} come, for the future of human habitations," should dare to tamper with the land which his Majesty had just marked out, "Ninib, lord of boundaries and boundary-stones, tear out his boundary stone. Gula, great lady, put lingering illness into his body, that dark and light red blood he may pour out like water. Ishtar, lady of countries, whose fury is a flood, reveal difficulties to him, that he escape not from misfortune. Nusku, mighty lord, powerful burner, the god, my creator, be his evil demon and may he burn his root. Whoever removes this stone, in the dust hides it, burns it with fire, casts it into water, shuts it up in an enclosure, causes a fool, a deaf man, an idiot to take it, places it in an invisible place, may the great gods, who upon this stone are mentioned by their names, curse him with an evil curse, tear out his foundation and destroy his seed."[38.1]

[Sidenote: Superstition as an ally of the rights of private property in Africa.] In Africa also superstition is a powerful ally of the rights of private property. Thus the Balonda place beehives on high trees in the forest and protect them against thieves by tying a charm or "piece of medicine" round the tree-trunks. This proves a sufficient protection. "The natives," says Livingstone, "seldom rob each other, for all believe that certain medicines can inflict disease and death; and though they consider that these are only known to a

few, they act on the principle that it is best to let them all alone. The gloom of these forests strengthens the superstitious feelings of the people. In other quarters, where they are not subjected to this influence, I have heard the chiefs issue proclamations to the effect, that real witchcraft medicines had been placed at certain gardens from which produce had been stolen; the thieves having risked the power of the ordinary charms previously placed there."[38.2]

[Sidenote: The Wanika of East Africa.] The Wanika of East Africa "believe in the power and efficacy of charms and amulets, and they wear them in great variety; legs, arms, neck, waist, hair, and every part of the body are laden with them, either for the cure or prevention of disease; for the expulsion or repulsion of evil spirits; and to keep at bay snakes, wild animals, and every other evil. {39} They hang painted calabashes from the baobab at their hut doors to keep away thieves; shells, dolls, eggs scratched over with Arabic characters by the _Wana Chuoni_ (sons of the book) of the coast, are placed about their plantations and in their fruit-trees, and they believe that death would overtake a thief who should disregard them. A charm bound to the leg of a fowl is ample protection for the village. There is no doubt that, superstitious as the people are, they dread running great risks for the sake of small gains, and so these charms answer their purpose."[39.1] [Sidenote: The Boloki of the Congo.] Among the Boloki of the Upper Congo, when a woman finds that the cassava roots, which she keeps soaking in a water-hole, are being stolen, she takes a piece of gum copal, and fixing it in the cleft of a split stick she puts it on the side of the hole, while at the same time she calls down a curse on the thief. If the thief is a man, he will henceforth have no luck in fishing; if she is a woman, she will have no more success in farming.[39.2] The Ekoi of Southern Nigeria protect their farms against thieves by bundles of palm leaves to which they give the name of _okpata_. Should any one steal from a farm thus protected, he will fall sick and will not recover unless he gives a certain dance, to which the name of _okpata_ is also applied.[39.3]

[Sidenote: Guardian spirits (_damzogs_) of property in Darfur.] In the mountains of Marrah, a district of Darfur, houses, goods, and cattle are protected against thieves by certain fierce and dangerous guardian-spirits called _damzogs_, which can be bought like watch dogs. Under the guardianship of such a spiritual protector the sheep and cows are left free to wander at will; for if any one were rash enough to attempt to steal or kill one of the beasts, his hand with the knife in it would remain sticking fast to the animal's throat till the owner came and caught the rascal. An Arab merchant, travelling in Darfur, received from a friend the following account of the way to procure one of these useful guardians. "At the time when I first began to trade, my friend, I often heard that _damzogs_ could be bought and sold, and that to procure one I must apply to the owner of a _damzog_, and {40} discuss the price with him. When the bargain is concluded, it is necessary to give a large gourd of milk to the seller, who takes it to his house, where are his _damzogs_. On entering he salutes them, and goes and hangs up his vase to a hook, saying,--'One of my friends--such a one--very rich, is in fear of robbers, and asks me to supply him with a guardian. Will one of you go and live in his house? There is plenty of milk there, for it is a house of blessing, and the proof thereof is, that I bring you this _kara_ of milk.' The _damzogs_ at first refuse to comply with the invitation. 'No, no,' say they, 'not one of us will go.' The master of the hut conjures them to comply with his desires, saying, 'Oh! let the one that is willing descend into the _kara_.' He then retires a little, and presently one of the _damzogs_ is heard to flop into the milk, upon which he hastens and claps upon the vase a cover made of date-leaves. Thus stopped up he unhooks the _kara_, and hands it over to the buyer, who takes it away and hangs it on the wall of his hut, and confides it to the care of a slave or of a wife, who every morning comes and takes it, emptying out the milk, washing it and replenishing it, and hanging it up again. From that time forward the house is safe from theft or loss." The merchant's informant, the Shereef Ahmed Bedawee, had himself purchased one of these guardian spirits, who proved most vigilant and efficient in the discharge of his duties; indeed his zeal was excessive, for he not only killed several slaves who tried to rob his master, but did summary execution on the Shereef's own son, when the undutiful young man essayed to pilfer from his father's shop. This was too much for the Shereef; he invited a party of friends to assist him in expelling the inflexible guardian. They came armed with guns and a supply of ammunition, and by raking the shop with repeated volleys of musketry they at last succeeded in putting the spirit to flight.[40.1]

[Sidenote: The curses of smiths and potters.] Amongst the Nandi of British East Africa nobody dares to steal anything from a smith; for if he did, the smith would heat his furnace, and as he blew the bellows to make {41} the flames roar he would curse the thief so that he would die. And in like manner among these people, with whom the potters are women, nobody dares to filch anything from a potter; for next time she heated her wares the potter would curse him, saying, "Burst like a pot, and may thy house become red," and the thief so cursed would die.[41.1] [Sidenote: Charms to protect property in West Africa.] In Loango, when a man is about to absent himself from home for a considerable time he protects his hut by placing a charm or fetish before it, consisting perhaps of a branch with some bits of broken pots or trash of that sort; and we are told that even the most determined robber would not dare to cross a threshold defended by these mysterious signs.[41.2] On the coast of Guinea fetishes are sometimes inaugurated for the purpose of detecting and punishing certain kinds of theft; and not only the culprit himself, but any person who knows of his crime and fails to give information is liable to be punished by the fetish. When such a fetish is instituted, the whole community is warned

of it, so that he who transgresses thereafter does so at his peril. For example, a fetish was set up to prevent sheep-stealing and the people received warning in the usual way. Shortly afterwards a slave, who had not heard of the law, stole a sheep and offered to divide it with a friend. The friend had often before shared with him in similar enterprises, but the fear of the fetish was now too strong for him; he informed on the thief, who was brought to justice and died soon after of a lingering and painful disease. Nobody in the country ever doubted but that the fetish had killed him.[41.3] Among the Ewe-speaking tribes of the Slave Coast in West Africa houses and household property are guarded by amulets (_võ-sesao_), which derive their virtue from being consecrated or belonging to the gods. The crops, also, in solitary glades of the forest are left under the protection of such amulets, generally fastened to long sticks in some conspicuous position; and so guarded they are quite safe from pillage. By the side of the paths, too, may be seen food and palm-wine {42} lying exposed for sale with nothing but a charm to protect them; a few cowries placed on each article indicate its price. Yet no native would dare to take the food or the wine without depositing its price; for he dreads the unknown evil which the god who owns the charm would bring upon him for thieving.[42.1] In Sierra Leone charms, called _greegrees_, are often placed in plantations to deter people from stealing, and it is said that "a few old rags placed upon an orange tree will generally, though not always, secure the fruit as effectually as if guarded by the dragons of the Hesperides. When any person falls sick, if, at the distance of several months, he recollects having stolen fruit, etc., or having taken it _softly_ as they term it, he immediately supposes _wangka_ has caught him, and to get cured he must go or send to the person whose property he had taken, and make to him whatever recompense he demands."[42.2]

[Sidenote: Charms to protect property in the West Indies.] Superstitions of the same sort have been transported by the negroes to the West Indies, where the name for magic is _obi_ and the magician is called the _obeah_ man. There also, we are told, the stoutest-hearted negroes "tremble at the very sight of the ragged bundle, the bottle or the egg-shells, which are stuck in the thatch or hung over the door of a hut, or upon the branch of a plantain tree, to deter marauders.… When a negro is robbed of a fowl or a hog, he applies directly to the _Obeah_-man or woman; it is then made known among his fellow blacks, that _obi_ is set for the thief; and as soon as the latter hears the dreadful news, his terrified imagination begins to work, no resource is left but in the superior skill of some more eminent _Obeah_-man of the neighbourhood, who may counteract the magical operations of the other; but if no one can be found of higher rank and ability; or if, after gaining such an ally, he should still fancy himself affected, he presently falls into a decline, under the incessant horror of impending calamities. The slightest painful sensation in the head, the bowels, or {43} any other part, any casual loss or hurt, confirms his apprehensions, and he believes himself the devoted victim of an invisible and irresistible agency. Sleep, appetite and cheerfulness forsake him; his strength decays, his disturbed imagination is haunted without respite, his features wear the settled gloom of despondency: dirt, or any other unwholesome substance, becomes his only food, he contracts a morbid habit of body, and gradually sinks into the grave."[43.1] Superstition has killed him.

[Sidenote: Conclusion.] Similar evidence might doubtless be multiplied, but the foregoing cases suffice to shew that among many peoples and in many parts of the world superstitious fear has operated as a powerful motive to deter men from stealing. If that is so, then my second proposition may be regarded as proved, namely, that among certain races and at certain times superstition has strengthened the respect for private property and has thereby contributed to the security of its enjoyment.

IV. MARRIAGE

{44}

[Sidenote: Superstition as a prop of sexual morality.] I pass now to my third proposition, which is, that among certain races and at certain times superstition has strengthened the respect for marriage, and has thereby contributed to a stricter observance of the rules of sexual morality both among the married and the unmarried. That this is true will appear, I think, from the following instances.

[Sidenote: Adultery or fornication supposed by the Karens to blight the crops.] Among the Karens of Burma "adultery, or fornication, is supposed to have a powerful influence to injure the crops. Hence, if there have been bad crops in a village for a year or two, and the rains fail, the cause is attributed to secret sins of this character, and they say the God of heaven and earth is angry with them on this account; and all the villagers unite in making an offering to appease him." [Sidenote: Pig's blood used to expiate the crime.] And when a case of adultery or fornication has come to light, "the elders decide that the transgressors must buy a hog, and kill it. Then the woman takes one foot of the hog, and the man takes another, and they scrape out furrows in the ground with each foot, which they fill with the blood of the hog. They next scratch the ground with their hands and pray: 'God of heaven and earth, God of the mountains and hills, I have destroyed the productiveness of the country. Do not be angry with me, do not hate me; but have mercy on me, and compassionate me. Now I repair the mountains, now I heal the hills, and the streams and the lands. May there

be no failure of crops, may there be no unsuccessful labours, or unfortunate efforts in my country. Let them be dissipated to the foot of the horizon. Make thy paddy fruitful, thy rice abundant. Make the vegetables to flourish. {45} If we cultivate but little, still grant that we may obtain a little.' After each has prayed thus, they return to the house and say they have repaired the earth."[45.1] Thus, according to the Karens adultery and fornication are not simply moral offences which concern no one but the culprits and their families: they physically affect the course of nature by blighting the earth and destroying its fertility; hence they are public crimes which threaten the very existence of the whole community by cutting off its food supplies at the root. But the physical injury which these offences do to the soil can be physically repaired by saturating it with pig's blood.

[Sidenote: Disastrous effects ascribed to sexual crime in Assam, Bengal, and Annam.] Some of the tribes of Assam similarly trace a connexion between the crops and the behaviour of the human sexes; for they believe that so long as the crops remain ungarnered, the slightest incontinence would ruin all.[45.2] Again, the inhabitants of the hills near Rajamahal in Bengal imagine that adultery, undetected and unexpiated, causes the inhabitants of the village to be visited by a plague or destroyed by tigers or other ravenous beasts. To prevent these evils an adulteress generally makes a clean breast. Her paramour has then to furnish a hog, and he and she are sprinkled with its blood, which is supposed to wash away their sin and avert the divine wrath. When a village suffers from plague or the ravages of wild beasts, the people religiously believe that the calamity is a punishment for secret immorality, and they resort to a curious form of divination to discover the culprits, in order that the crime may be duly expiated.[45.3] The Khasis of Assam are divided into a number of clans which are exogamous, that is to say, no man may marry a woman of his own clan. Should a man be found to cohabit with a woman of his own clan, it is treated as incest and is believed to cause great disasters; the people will be struck by lightning or killed by tigers, the women will die in child-bed, and {46} so forth. The guilty couple are taken by their clansmen to a priest and obliged to sacrifice a pig and a goat; after that they are made outcasts, for their offence is inexpiable.[46.1] The Orang Glai, a savage tribe in the mountains of Annam, similarly suppose that illicit love is punished by tigers, which devour the sinners. If a girl is found with child, her family offers a feast of pigs, fowls, and wine to appease the offended spirits.[46.2]

[Sidenote: Similar views held by the Battas of Sumatra.] The Battas of Sumatra in like manner think that if an unmarried woman is with child, she must be given in marriage at once, even to a man of lower rank; for otherwise the people will be infested with tigers, and the crops in the fields will not be abundant. They also believe that the adultery of married women causes a plague of tigers, crocodiles, or other wild beasts. The crime of incest, in their opinion, would blast the whole harvest, if the wrong were not speedily repaired. Epidemics and other calamities that affect the whole people are almost always traced by them to incest, by which is to be understood any marriage that conflicts with their customs.[46.3] The natives of Nias, an island to the west of Sumatra, imagine that heavy rains are caused by the tears of a god weeping at the commission of adultery or fornication. The punishment for these crimes is death. The two delinquents, man and woman, are buried in a narrow grave with only their heads projecting above ground; then their throats are stabbed with a spear or cut with a knife, and the grave is filled up. Sometimes, it is said, they are buried alive. However, the judges are not always incorruptible and the injured family not always inaccessible to the allurement of gain; and pecuniary compensation is sometimes accepted as a sufficient salve for wounded honour. But if the wronged man is a chief, the culprits must surely die. As a consequence, perhaps, of this severity, the crimes {47} of adultery and fornication are said to be far less frequent in Nias than in Europe.[47.1]

[Sidenote: Similar views among the tribes of Borneo.] Similar views prevail among many tribes in Borneo. Thus in regard to the Sea Dyaks we are told by Archdeacon Perham that "immorality among the unmarried is supposed to bring a plague of rain upon the earth, as a punishment inflicted by _Petara_. [Sidenote: Excessive rains thought by the Dyaks to be caused by sexual offences.] It must be atoned for with sacrifice and fine. In a function which is sometimes held to procure fine weather, the excessive rain is represented as the result of the immorality of two young people. _Petara_ is invoked, the offenders are banished from their home, and the bad weather is said to cease. Every district traversed by an adulterer is believed to be accursed of the gods until the proper sacrifice has been offered."[47.2] When rain pours down day after day and the crops are rotting in the fields, these Dyaks come to the conclusion that some people have been secretly indulging in lusts of the flesh; so the elders lay their heads together and adjudicate on all cases of incest and bigamy, and purify [Sidenote: Blood of pigs shed to expiate incest and unchastity.] the earth with the blood of pigs, which appears to these savages, as sheep's blood appeared to the ancient Hebrews, to possess the valuable property of atoning for moral guilt. Not long ago the offenders, whose lewdness had thus brought the whole country into danger, would have been punished with death or at least slavery. A Dyak may not marry his first cousin unless he first performs a special ceremony called _bergaput_ to avert evil consequences from the land. The couple repair to the water-side, fill a small pitcher with their personal ornaments, and sink it in the river; or instead of a jar they fling a chopper and a plate into the water. A pig {48} is then sacrificed on the bank, and its carcase, drained of blood, is thrown in after the jar. Next the pair are pushed into the

water by their friends and ordered to bathe together. Lastly, a joint of bamboo is filled with pig's blood, and the couple perambulate the country and the villages round about, sprinkling the blood on the ground. After that they are free to marry. This is done, we are told, for the sake of the whole country, in order that the rice may not be blasted by the marriage of cousins.[48.1] Again, we are informed that the Sibuyaus, a Dyak tribe of Sarawak, are very careful of the honour of their daughters, because they imagine that if an unmarried girl is found to be with child it is offensive to the higher powers, who, instead of always chastising the culprits, punish the tribe by visiting its members with misfortunes. Hence when such a crime is detected they fine the lovers and sacrifice a pig to appease the angry powers and to avert the sickness or other calamities that might follow. Further, they inflict fines on the families of the couple for any severe accident or death by drowning that may have happened at any time within a month before the religious atonement was made; for they regard the families of the culprits as responsible for these mishaps. The fines imposed for serious or fatal accidents are heavy; for simple wounds they are lighter. With the fear of these fines before their eyes parents keep a watchful eye on the conduct of their daughters. Among the Dyaks of the Batang Lupar river the chastity of the unmarried girls is not so strictly guarded; but in respectable families, when a daughter proves frail, they sacrifice a pig and sprinkle its blood on the doors to wash away the sin.[48.2] The Hill Dyaks of Borneo abhor incest and do not allow the marriage even of cousins. In 1846 the Baddat Dyaks complained to Mr. Hugh Low that one of their chiefs had disturbed the peace and prosperity of the village by marrying his own granddaughter. Since that disastrous event, they said, no bright day had blessed their territory; rain and darkness alone prevailed, and unless the plague-spot were {49} removed, the tribe would soon be ruined. The old sinner was degraded from office, but apparently allowed to retain his wife; and the domestic brawls between this ill-assorted couple gave much pain to the virtuous villagers.[49.1]

[Sidenote: Incest punished with death by the pagan tribes of Borneo.] Among the pagan tribes of Borneo in general, but of Sarawak in particular, "almost all offences are punished by fines only. Of the few offences which are felt to require a heavier punishment, the one most seriously regarded is incest. For this offence, which is held to bring grave peril to the whole house, especially the danger of starvation through failure of the _padi_ crop, two punishments have been customary. If the guilt of the culprits is perfectly clear, they are taken to some open spot on the river-bank at some distance from the house. There they are thrown together upon the ground and a sharpened bamboo stake is driven through their bodies, so that they remain pinned to the earth. The bamboo, taking root and growing luxuriantly on this spot, remains as a warning to all who pass by; and, needless to say, the spot is looked on with horror and shunned by all men. The other method of punishment is to shut up the offenders in a strong wicker cage and to throw them into the river. This method is resorted to as a substitute for the former one, owing to the difficulty of getting any one to play the part of executioner and to drive in the stake, for this involves the shedding of the blood of the community. The kind of incest most commonly committed is the connection of a man with an adopted daughter, and (possibly on account of this frequency) this is the kind which is most strongly reprobated…. The punishment of the incestuous couple does not suffice to ward off the danger brought by them upon the community. The household must be purified with the blood of pigs and fowls; the animals used are the property of the offenders or of their family; and in this way a fine is imposed. When any calamity threatens or falls upon a house, especially a great rising of the river which threatens to sweep away the house or the tombs of the household, the Kayans are led to suspect that incestuous intercourse in their own or in neighbouring houses has taken place; and they look round for evidences of it, and sometimes detect a case which otherwise would {50} have remained hidden. It seems probable that there is some intimate relation between this belief and the second of the two modes of punishment described above; but we have no direct evidence of such connection. All the other peoples also, except the Punans, punish incest with death. Among the Sea Dyaks the most common form of incest is that between a youth and his aunt, and this is regarded at least as seriously as any other form."[50.1]

[Sidenote: Evil and confusion supposed by the Dyaks to be wrought by fornication.] Nor is it the heinous crime of incest alone which in the opinion of the Sea Dyaks endangers the whole community. The same effect is supposed to follow whenever an unmarried woman is found with child and cannot or will not name her seducer. "The greatest disgrace," we are told, "is attached to a woman found in a state of pregnancy, without being able to name her husband; and cases of self-poisoning, to avoid the shame, are not of unusual occurrence. If one be found in this state, a fine must be paid of pigs and other things. Few even of the chiefs will come forward without incurring considerable responsibility. A pig is killed, which nominally becomes the father, for want, it is supposed, of another and better one. Then the surrounding neighbours have to be furnished with a share of the fine to banish the _Jabu_, which exists after such an event. If the fine be not forthcoming, the woman dare not move out of her room, for fear of being molested, as she is supposed to have brought evil (_kudi_) and confusion upon the inhabitants and their belongings."[50.2]

[Sidenote: Similar beliefs and customs among the tribes of Dutch Borneo.] The foregoing accounts refer especially to the tribes of Borneo under British rule; but similar ideas and customs prevail among the kindred tribes of Dutch Borneo. Thus the Kayans or Bahaus in the interior of the island believe that adultery is punished by the spirits, who visit the whole tribe with failure of the crops

and other misfortunes. Hence in order to avert these evil consequences from the innocent members of the tribe, the two culprits, with all their possessions, are first placed on a gravel bank in the middle of the river, in order to isolate or, in electrical {51} language, to insulate them and so prevent the moral or rather physical infection from spreading. Then pigs and fowls are killed, and with the blood priestesses smear the property of the guilty pair in order to disinfect it. Finally, the two are placed on a raft, with sixteen eggs, and allowed to drift down stream. They may save themselves by plunging into the water and swimming ashore; but this is perhaps a mitigation of an older sentence of death by drowning, for young people still shower long grass stalks, representing spears, at the shamefaced and dripping couple.[51.1] Certain it is, that some Dyak tribes used to punish incest by fastening the man and woman in separate baskets laden with stones and drowning them in the river. By incest they understood the cohabitation of parents with children, of brothers with sisters, and of uncles and aunts with nieces and nephews. A Dutch resident had much difficulty in saving the life of an uncle and niece who had married each other; finally he procured their banishment to a distant part of Borneo.[51.2] The Blu-u Kayans, another tribe in the interior of Borneo, believe that an intrigue between an unmarried pair is punished by the spirits with failure of the harvest, of the fishing, and of the hunt. Hence the delinquents have to appease the wrath of the spirits by sacrificing a pig and a certain quantity of rice.[51.3] In Pasir, a district of Eastern Borneo, incest is thought to bring dearth, epidemics, and all sorts of evils on the land.[51.4] In the island of Ceram a man convicted of unchastity has to smear every house in the village with the blood of a pig and a fowl: this is supposed to wipe out his guilt and ward off misfortunes from the village.[51.5]

[Sidenote: Failure of the crops and other disasters thought to be caused by incest in Celebes.] When the harvest fails in Southern Celebes, the Macassars and Bugineese regard it as a sure sign that incest has been committed and that the spirits are angry. In the years 1877 and 1878 it happened that the west monsoon did not {52} blow and that the rice crop in consequence came to nothing; moreover many buffaloes died of a murrain. At the same time there was in the gaol at Takalar a prisoner, who had been formerly accused of incest. Some of the people of his district begged the Dutch governor to give the criminal up to them, for according to the general opinion the plagues would never cease till the guilty man had received the punishment he deserved. All the governor's powers of persuasion were needed to induce the petitioners to return quietly to their villages; and when the prisoner, having served his time, was released shortly afterwards, he was, at his own request, given an opportunity of sailing away to another land, as he no longer felt safe in his own country.[52.1] [Sidenote: Disastrous effects supposed to follow from shedding the blood of incestuous couples on the ground.] Even when the incestuous couple has been brought to justice, their blood may not be shed; for the people think that, were the ground to be polluted by the blood of such criminals, the rivers would dry up and the supply of fish would run short, the harvest and the produce of the gardens would miscarry, edible fruits would fail, sickness would be rife among cattle and horses, civil strife would break out, and the country would suffer from other widespread calamities. Hence the punishment of the guilty is such as to avoid the spilling of their blood: usually they are tied up in a sack and thrown into the sea to drown. Yet they get on their journey to eternity the necessary provisions, consisting of a bag of rice, salt, dried fish, coco-nuts, and other things, among which three quids of betel are not forgotten.[52.2] We can now perhaps understand why the Romans used to sew up a parricide in a sack with a dog, a cock, a viper, and an ape for company, and fling him into the sea. They probably feared to defile the soil of Italy by spilling upon it the blood of such a miscreant.[52.3] Amongst the Tomori of Central Celebes {53} a person guilty of incest is throttled; no drop of his blood may fall on the ground, for if it did, the rice would never grow again. The union of uncle with niece is regarded by these people as incest, but it can be expiated by an offering. A garment of the man and one of the woman are laid on a copper vessel; the blood of a sacrificed animal, either a goat or a fowl, is allowed to drip on the garments, and then the vessel with its contents is set floating down the river.[53.1] Among the Tololaki, another tribe of Central Celebes, persons who have defiled themselves with incest are shut up in a basket and drowned. No drop of their blood may be spilt on the ground, for that would hinder the earth from ever bearing fruit again.[53.2] Among the Bare'e-speaking Toradjas of Central Celebes in general the penalty for incest, that is for the sexual intercourse of parents with children or of brothers with sisters, is death. But whereas the death-sentence for adultery is executed with a spear or a sword, the death-sentence for incest is usually executed among the inland tribes by clubbing or throttling; for were the blood of the culprits to drip on the ground, the earth would be rendered barren. The people on the coast put the guilty pair in a basket, weight it with stones, and fling it into the sea. This prescribed manner of putting the incestuous to death, we are informed, makes the execution very grievous. However, the writers who furnish us with these particulars and who have lived among the people on terms of intimacy for many years, add that "incest seldom occurs, or rather the cases that come to light are very few."[53.3] In some districts of Central Celebes, the marriage of cousins, provided they are children of two sisters, is forbidden under pain of death; the people think that such an alliance would anger the spirits, and that the rice and maize harvests would fail. Strictly speaking, two such cousins who have committed the {54} offence should be tied together, weighted with stones, and thrown into water to drown. In practice, however, the culprits are spared and their sin expiated by shedding the blood of a buffalo or a goat. The blood is mixed with water and sprinkled on the rice-fields or

poured on the maize-fields, no doubt in order to appease the angry spirits and restore its fertility to the tilled land. The natives of these districts believe that were a brother and sister to commit incest, the ground on which the tribe dwells would be swallowed up. If such a crime takes place, the guilty pair are tied together, their feet weighted with stones, and thrown into the sea.[54.1]

[Sidenote: Excessive rains, earthquakes, and volcanic eruptions supposed to be produced by incest in Halmahera.] When it rains in torrents, the Galelareese of Halmahera, another large East Indian island, say that brother and sister, or father and daughter, or in short some near kinsfolk are having illicit relations with each other, and that every human being must be informed of it, for then only will the rain cease to descend. The superstition has repeatedly caused blood relations to be accused, rightly or wrongly, of incest. Further, the people think that alarming natural phenomena, such as a violent earthquake or the eruption of a volcano, are caused by crimes of the same sort. Persons charged with such offences are brought to Ternate; it is said that formerly they were often drowned on the way or, on being haled thither, were condemned to be thrown into the volcano.[54.2] In the Banggai Archipelago, to the east of Celebes, earthquakes are explained as punishments inflicted by evil spirits for indulgence in illicit love.[54.3]

[Sidenote: Breaches of sexual morality thought to blight the fruits of the earth and otherwise disturb the course of nature in Africa.] In some parts of Africa, also, it is believed that breaches of sexual morality disturb the course of nature, particularly by blighting the fruits of the earth; and probably such views {55} are much more widely diffused in that continent than the scanty and fragmentary evidence at our disposal might lead us to suppose. Thus, the negroes of Loango, in West Africa, imagine that the commerce of a man with an immature girl is punished by God with drought and consequent famine until the transgressors expiate their transgression by dancing naked before the king and an assembly of the people, who throw hot gravel and bits of glass at the pair as they run the gauntlet. The rains in that country should fall in September, but in 1898 there was a long drought, and when the month of December had nearly passed, the sun-scorched stocks of the fruitless Indian corn shook their rustling leaves in the wind, the beans lay shrivelled and black on the ruddy soil, and the shoots of the sweet potato had flowered and withered long ago. The people cried out against their rulers for neglecting their duty to the primeval powers of the earth; the priests of the sacred groves had recourse to divination and discovered that God was angry with the land on account of the immorality of certain persons unknown, who were not observing the traditions and laws of their God and country. The feeble old king had fled, but the slave who acted as regent in his room sent word to the chiefs that there were people in their towns who were the cause of God's wrath. So every chief called his subjects together and caused enquiries to be made, and then it was discovered that three girls had broken the customs of their country; for they were with child before they had passed through what is called the paint-house, that is, before they had been painted red and secluded for a season in token that they had attained to the age of puberty. The people were incensed and endeavoured to punish or even kill the three girls; and the English writer who has recorded the case has thought it worth while to add that on the very morning when the culprits were brought before the magistrate rain fell.[55.1] Amongst the Bavili of Loango, who are divided into totemic clans, no man is allowed to marry a woman of his mother's clan; and God is {56} believed to punish a breach of this marriage law by withholding the rains in their due season.[56.1] Similar notions of the blighting influence of sexual crime appear to be entertained by the Nandi of British East Africa; for we are told that when a warrior has got a girl with child, she "is punished by being put in Coventry, none of her girl friends being allowed to speak to or look at her until after the child is born and buried. [Sidenote: Sexual purity required of those who handle corn or enter a granary.] She is also regarded with contempt for the rest of her life and may never look inside a granary for fear of spoiling the corn."[56.2] Among the Basutos in like manner "while the corn is exposed to view, all defiled persons are carefully kept from it. If the aid of a man in this state is necessary for carrying home the harvest, he remains at some distance while the sacks are filled, and only approaches to place them upon the draught oxen. He withdraws as soon as the load is deposited at the dwelling, and under no pretext can he assist in pouring the corn into the basket in which it is preserved."[56.3] The nature of the defilement which thus disqualifies a man from handling the corn is not mentioned, but we may conjecture that unchastity would fall under this general head. For amongst the Basutos after a child is born a fresh fire has to be kindled in the dwelling by the friction of wood, and this must be done by a young man of chaste habits; it is believed that an untimely death awaits him who should dare to discharge this holy office after having lost his innocence.[56.4] In Morocco whoever enters a granary must first remove his slippers and must be sexually clean. Were an unclean person to enter, the people believe not only that the grain would lose its blessed influence (_baraka_), but that he himself would fall ill. A Berber told Dr. Westermarck {57} that he had suffered from painful boils through entering a granary in a state of uncleanness.[57.1] The same rule applies in Morocco to a vegetable garden. Only the sexually clean may enter it, otherwise both the vegetables and the person entering would be the worse for it.[57.2]

[Sidenote: Incest supposed by the Dinkas to be punished with sterility.] The Dinkas of the Upper Nile believe that incest angers the ancestral spirits (_jok_), who punish the girl by making her barren. Even should she marry, she will have no children until she has confessed her sin, and atonement has been made for it. Her lover must provide a bullock for sacrifice. His father kills the animal,

and the girl's father takes some of the contents of the large intestine and smears it on his daughter's abdomen and on that of her guilty partner. Thus the taint of sin is removed, and the woman is rendered capable of bearing children.[57.3] The Maloulekes and Hlengoues, two tribes of Southern Africa to the north of the Thonga, think that if a young man gets a girl, who is not his wife, with child, people will die in the village. Hence, when the girl's pregnancy is discovered, the lover has to provide a girl by way of fine.[57.4]

[Sidenote: Incest enjoined in certain cases as a mode of ensuring good luck.] It is very remarkable, however, that among tribes which strongly disapprove of incestuous relations in general, the act of incest is nevertheless positively enjoined in certain circumstances as a mode of ensuring good luck. Thus in the Thonga tribe of South-Eastern Africa, round about Delagoa Bay, there is a class of men who devote themselves to the business of hunting hippopotamuses on the rivers. In the pursuit of their trade they observe a number of curious superstitions which have been handed down among them for generations from father to son. For example, they inoculate themselves with a certain drug which is supposed to endow them with such a power over the hippopotamuses that when the hunter wounds one of them the animal cannot go far away and the man can track and {58} despatch it. During the day the hunter fishes in the river, keeping his eye all the time on the unwieldy monsters disporting themselves in the water or lumbering through the thickets on the banks. [Sidenote: Incest of Thonga hippopotamus hunter with his daughter.] "When he sees that the propitious season has come and when he is ready to undertake a hunting expedition of one month, he first calls his own daughter to his hut and has sexual relations with her. This incestuous act, which is strongly taboo in ordinary life, has made of him a 'murderer': he has killed something at home; he has acquired the courage for doing great deeds on the river. Henceforth he will have no sexual relations with his wives during the whole campaign. On the same night, immediately after the act, he starts with his sons; they close the drift where the beasts leave the river by putting a canoe across the track." Meantime the hippopotamuses are browsing in the forest or trampling down the crops of the fields in their clumsy fashion. As they come trooping back to the river they are stopped by the canoe in the path, and while they are examining the strange obstacle, the hunters, lying in ambush, dart their spears into the thick hides of the beasts. The handles of the spears are loosely attached to the blades, but connected with them by a long string, so that when the wounded monster, crashing irresistibly in his rage through the thicket, plunges into the river and sinks out of sight in the water, the handle of the spear becomes detached from the blade and floats like a buoy on the surface, shewing the direction taken by the beast. As soon as the hunter has thrown his spear he runs home to tell his wife. She must at once shut herself up in the hut and remain perfectly quiet, without eating or drinking or crushing her mealies; for were she to do any of these things, the wounded hippopotamus would shew fight and might kill her husband, whereas if she keeps quiet, the animal will be quiet too. All the hunters in the village are then called up, and embarking in a canoe, paddle away after their prey, whose retreat is marked by the bobbing of the spear-handle on the surface of the water and the occasional emergence of a great flat snout to breathe. When the beast has been despatched, and the carcase landed on the bank, it is turned on its back and the hunter creeps between its legs {59} from behind and along its belly and chest as far as the mouth. Then he goes away. By this ceremony the man is supposed to take upon himself the defilement, possibly the nature, of the animal, so that in future when he meets hippopotamuses the animals will not perceive him to be a man but will mistake him for an hippopotamus; and thus he will be able to slaughter the deluded creatures with impunity.[59.1]

[Sidenote: Suggested explanation of the Thonga practice.] So far as we can guess at the meaning of these curious rites, their general intention seems to be to identify the hunter and his family with the game which he hunts in order to give him full power over the animals. This intention is manifested in the behaviour of the hunter's wife while the hippopotamus is wounded; she so far identifies herself with the animal that whatever she does he is supposed to do. If she goes about her work briskly and refreshes herself with food and drink, the hippopotamus also will be brisk and refreshed, and will give warm work to his pursuers; whereas if she keeps perfectly still, the animal will make no resistance but follow the hunters like a sheep to the slaughter. Perhaps the same train of thought partially explains the incest which the hunter has to commit with his own daughter before he sets out for the chase. Can it be that by this violence done to his offspring he is supposed to acquire power over the beast? It may be so, yet it is difficult to see why the violence should take this particular form, and why, on the principles of homoeopathic or imitative magic, a pretence of wounding and killing the girl with a spear would not have served his turn better.

[Sidenote: Incest prescribed among the Antambahoaka of Madagascar.] Another tribe of savages who imagine that in certain circumstances incest is the road to fortune are the Antambahoaka of South-Eastern Madagascar. Before setting out for the chase or the fishing or war or other enterprise, every Antambahoaka arranges to have sexual relations with his sister or with his nearest female relation; he thinks in this way to ensure the success of his expedition.[59.2] What the {60} exact train of thought may be which prompts these exceptional and deliberate aberrations from the usual rules of morality, it is difficult to understand; I mention the facts because they apparently contradict the ordinary savage view of conduct, and so far help us to perceive how little as yet we

really know about the inmost workings of the savage mind.

[Sidenote: Similar beliefs as to the disastrous effect of sexual crimes among the civilized peoples of antiquity.] Leaving out of account these remarkable and as yet not fully explained exceptions to the rule,[60.1] we may say generally that among many savage races breaches of the marriage laws are believed to draw down on the community public calamities of the most serious character, and that in particular they are thought to blast the fruits of the earth through excessive rain or excessive drought. Traces of similar beliefs may perhaps be detected among the civilized races of antiquity. [Sidenote: The Hebrews.] Thus among the Hebrews we read how Job, passionately protesting his innocence before God, declares that he is no adulterer; "For that," says he, "were an heinous crime; yea it were an iniquity to be punished by the judges: for it is a fire that consumeth unto Destruction, and would root out all mine increase."[60.2] In this passage the Hebrew word translated "increase" commonly means "the produce of the earth";[60.3] and if we give the word its usual sense here, then Job affirms adultery to be destructive of the fruits of the ground, which is precisely what many savages still believe. This interpretation of his words is strongly confirmed by two narratives in Genesis, where we read how Sarah, Abraham's {61} wife, was taken by a king into his harem, and how thereafter God visited the king and his household with great plagues, especially by closing up the wombs of the king's wife and his maid-servants so that they bare no children. It was not till the king had discovered and confessed his sin, and Abraham had prayed God to forgive him, that the king's women again became fruitful.[61.1] These narratives seem to imply that adultery, even when it is committed in ignorance, is a cause of plague and especially of sterility among women. Again, in Leviticus, after a long list of sexual crimes, we read:[61.2] "Defile not ye yourselves in any of these things: for in all these the nations are defiled which I cast out from before you: and the land is defiled: therefore I do visit the iniquity thereof upon it, and the land vomiteth out her inhabitants." This passage seems to imply that the land itself was somehow physically affected by sexual transgressions in such a way that it could no longer support the inhabitants. [Sidenote: The Greeks.] Apparently the ancient Greeks entertained a similar view of the wasting effect of incest; for according to Sophocles the land of Thebes suffered from blight, pestilence, and the sterility both of women and cattle under the reign of Oedipus, who had unwittingly slain his father and married his mother; the country was emptied of its inhabitants, and the Delphic oracle declared that the only way to restore prosperity to it was to banish the sinner.[61.3] No doubt the poet and his hearers set down these public calamities in part to the guilt of parricide which rested on Oedipus; but probably they also laid much of the evil at the door of the incest which he had committed with his mother. [Sidenote: The Romans.] In the reign of the emperor Claudius a Roman noble was accused of incest with his sister. He committed suicide, his sister was banished, and the emperor ordered that certain ancient ceremonies derived from the laws of King Servius Tullius should be performed, and that expiation should be made by the pontiffs at the sacred grove of Diana.[61.4] As Diana appears to have been a goddess of fertility in general and of the {62} fruitfulness of women in particular,[62.1] the expiation for incest offered at her sanctuary may perhaps be accepted as evidence that the Romans, like other peoples, attributed to sexual immorality a tendency to blast the fruits both of the earth and of the womb.

[Sidenote: Blighting effect attributed to incest by the ancient Irish.] According to an ancient Irish legend Munster was afflicted in the third century of our era with a failure of the crops and other misfortunes. When the nobles enquired into the matter, they learned that these calamities were the result of an incest which the king had committed with his sister. In order to put an end to the evil they demanded of the king his two sons, the fruit of this unholy union, that they might consume them with fire and cast their ashes into the running stream.[62.2] Again, Irish legend relates that Cairbre Musc "had two sons by his sister. Her name was Duben, and theirs were Corc and Cormac respectively. The children were twins, and the story of their birth is no less strange than that of Dylan and Llew, for one of them was found to have nipped off his brother's ears before his birth. The crime of their parents caused the crops to fail, which, according to the idea prevalent in ancient Ireland, was its natural result, and Cairbre was obliged to confess his guilt to the nobles of his realm, who, when the children were born, ordered them to be burnt, that the incest might not remain in the land. 'Give me,' said Cairbre's druid, 'that _Corc_[62.3] there, that I may place him outside Erinn, so that the incest may not be within it.' Corc was given to the druid, and the latter, with his wife, whose name was Bói, took him to an island. They had a white cow with red ears, and an ablution was performed by them every morning on Corc, placed on the cow's back; so in a year's time to the day the cow sprang away from them into the sea, and she became a rock in it; to wit, the heathenism of the boy had entered into her. _Bó Búi_, or Bói's Cow, is the name of the rock, and _Inis Búi_, or Bói's Isle, that of the island. The boy was {63} afterwards brought back into Erinn. Such is the story how Corc was purged of the virulence of his original sin, and the scene is one of the three islets called the Bull, the Cow and the Calf, not far from Dursey Island, in the gulf called Kenmare River."[63.1]

[Sidenote: Thus sexual irregularities are often supposed to endanger the whole community.] Thus it appears that in the opinion of many peoples sexual irregularities, whether of the married or the unmarried, are not merely moral offences which affect only the few persons immediately concerned; they are believed to involve the whole people in danger and disaster either directly by a sort of

magical influence or indirectly by rousing the wrath of gods to whom these acts are offensive. Nay they are often supposed to strike a blow at the very existence of the community by blighting the fruits of the earth and thereby cutting off the food supply. Wherever these superstitions prevail, it is obvious that public opinion and public justice will treat sexual offences with far greater severity than is meted out to them by peoples who, like most civilized nations, regard such misdemeanours as matters of private rather than of public concern, as sins rather than crimes, which may perhaps affect the eternal welfare of the individual sinner in a life hereafter, but which do not in any way imperil the temporal welfare of the innocent community as a whole. [Sidenote: Hence the extreme rigour with which sexual crimes have been punished by many races.] And conversely, wherever we find that incest, adultery, and fornication are treated by the community with extreme rigour, we may reasonably infer that the original motive for such treatment was superstition; in other words, that wherever a tribe or nation, not content with leaving these transgressions to be avenged by the injured parties, has itself punished them with exceptional severity, the reason for doing so has probably been a belief that the effect of all such delinquencies is to disturb the course of nature and thereby to endanger the whole people, who accordingly must protect themselves by effectually disarming and, if necessary, exterminating the delinquents. [Sidenote: Ancient codes.] This may explain, for example, why the Indian Laws of Manu decreed that an adulteress should be devoured by dogs in a public place, and that an adulterer should be roasted to death on a red-hot iron {64} bed;[64.1] why the Babylonian code of Hammurabi sentenced an adulterous couple to be strangled and cast into the river; and why the same code punished incest with a mother by burning both the culprits.[64.2] On the same supposition we can understand the severity of the punishments meted out to certain sexual offences by the Mosaic law. Thus, for example, under it an adulteress and her paramour were sentenced to death:[64.3] a woman who at marriage was found not to be a maid was stoned:[64.4] the unchaste daughter of a priest was burned with fire;[64.5] and if a man married a woman and her daughter, he and they were in like manner doomed to the flames.[64.6]

[Sidenote: Rigorous penalties inflicted in Africa.] Many African tribes repress sexual crimes by rigorous penalties, or did so until their moral standard was modified by contact with Europeans. [Sidenote: The Baganda, their punishments for breaches of sexual morality.] Among the Baganda of Central Africa, “though death was usually the punishment inflicted for adultery, an offender’s life would sometimes be spared, and he be fined two women, if he were able to pay them; the culprit was, however, maimed; he lost a limb, or had an eye gouged out, and showed by his maimed condition that he had been guilty of a crime. A slave taken in adultery with one of his master’s wives was invariably put to death. Women were compelled by torture to name their seducers; if the accused man denied the charge, the woman was asked to describe some personal peculiarity of his, or some mark on his body which could be identified; then if the man was found to have the peculiarity, he was either fined or put to death. In order to arrive at the truth, a man who denied a charge made against him was sometimes stretched out with his arms and feet tied to stakes driven firmly into the ground, a piece of barkcloth was then fastened about his private parts, and set smouldering. As soon as the fire reached his body, the pain became too great {65} to bear, and the man would own himself guilty in order to be released from torture. He would then be either killed or fined. An adulterer was called a murderer (_musi_), because he was looked upon as a man who deliberately set about to compass the death of the woman’s husband; either directly, for he would go armed to visit the woman, and if he was disturbed, he would not hesitate to strike; or indirectly, by offending the fetiches. Men knew that, if they were caught in the act of adultery, the penalty would be death, unless they were related to the person wronged, in which case the latter might be willing to accept a fine, and might content himself with mutilating the culprit. The worst consequence to the injured husband was the anger of his fetiches and gods, whose custodian was his wife. By her action the wife had involved her husband in their displeasure; he was thus left exposed to the malice of any enemy, and his danger was increased in the time of war, because the gods had withdrawn their protection from him.”[65.1] Thus among the Baganda adultery was regarded not simply as a civil offence but as a sin, which brought down the anger of the gods, not as we might expect, on the adulterer, but on the injured husband. Further, the Baganda were divided into a number of totemic clans, and members of any one clan were strictly prohibited from marrying or having sexual relations with each other. “Sexual intercourse with a member of the same clan (_kive_), or with a woman of the mother’s clan, was punished by the death of both parties, because they were considered to have brought the god’s displeasure on the whole clan.”[65.2]

[Sidenote: Fornication, adultery, and incest severely punished by other African tribes.] Among the Basoga, who border on the Baganda to the east, when a man got a virgin with child, the guilty couple used to be dragged off to the River Ntakwe; there stones were tied to their ankles and legs, and, along with a sacrificial sheep, they were thrown into the water and drowned. However, this rigorous penalty was abolished and a fine substituted before the country came under British rule.[65.3] Among the Kavirondo, who border on the Basoga to the {66} east, “until quite recently adultery on the part of a wife was punished with death, and death equally was meted out to young men and girls who were found guilty of fornication. It was thought a shameful thing if a girl was not found to be a virgin on her wedding day.”[66.1] Among the Nandi, who border on the Kavirondo to the north-east, “incest, intercourse with a

step-mother, step-daughter, cousin or other near relation, is punished by what is known as _injoket_. A crowd of people assemble outside the house of the culprit, who is dragged out, and the punishment is inflicted by the women, all of whom, both young and old, strip for the occasion. The man is flogged, his houses and crops destroyed, and some of his stock confiscated."[66.2] Among the Barea, a tribe on the borders of Abyssinia, when a single woman, whether maid or widow, is found with child, she is strangled by her father or brother, and the same punishment is inflicted on her seducer; the child of their unlawful union is stabbed. This custom is rigorously carried out, except when the seducer is a noble and his paramour a vassal; in that case both are spared, but the infant is killed.[66.3] Among the Beni Amer, another tribe of the same region, an unmarried girl found pregnant is put to death by her own brother, whatever her rank, and the seducer is killed by his own brother; the child also is slain. But the law is not so severe on a widow or divorced wife who is detected in a slip; her seducer has only to pay a fine; but the child is buried alive. The Beni Amer will not suffer a bastard to live.[66.4] Among the Anyanja of British Central Africa adultery was punished by drowning and shooting. If one of the culprits was a chief's wife, she was tied to her paramour, and the pair were then thrown into a river to drown or left in the open space of the village to die of hunger and exposure. A man who had committed a rape was bound, weighted with stones, and cast into the lake.[66.5] Among the Awemba of Northern Rhodesia, {67} when a husband detected his wife in the act of adultery, he killed both her and her partner in guilt. For such execution he might not be indicted for murder or manslaughter. He would merely return the blood-stained spear to the woman's father, who by his words in the marriage ceremony, "You shall spear the man who lusts after your wife," was estopped from taking vengeance for the death of his daughter. If the husband spared the erring couple and the wife was again taken in adultery, the villagers themselves decreed the punishment. The unfaithful wife and her lover were dragged outside the village and impaled on sharp stakes amid the taunts and jeers of the bystanders, who only desisted from their mockery when death had stilled the writhing agony of the sufferers.[67.1] "The Hottentots," says an old writer, "allow not marriages between first or second cousins. They have a traditionary law, which ordains, that both man and woman, so near to each other in blood, who shall be convicted of joining together either in marriage or fornication, shall be cudgel'd to death. This law, they say, has prevail'd through all the generations of 'em; and that they execute it at once, upon a conviction, without any regard to wealth, power or affinity."[67.2]

[Sidenote: Incest and adultery severely punished in the East Indies.] We have seen that in the East Indies sexual crimes, particularly incest, adultery, and fornication, are often viewed with grave displeasure because they are believed to draw down the wrath of the higher powers on the whole community. Hence it is natural that such offences should be treated as high treason and the offenders punished with death. A common punishment is drowning. For example, when incest between a parent and a child or between a brother and a sister has been detected among the Kubus, a primitive aboriginal tribe of Sumatra, the culprits are enclosed in a large fish-trap, made of rattan or bamboo, and sunk in a deep pool of the river. However, they are not pinioned; nay, they are even furnished with a tin knife, and {68} if they can cut their way out of the trap, rise through the bubbling water to the surface, and swim ashore, they are allowed to live.[68.1] In the island of Bali incest and adultery are punished by drowning; the criminals are sewed up in a sack half-filled with stones and rice and cast into the sea. A like doom is incurred by a woman who marries a man of a lower caste; but sometimes she dies a more dreadful death, being burnt alive. [Sidenote: Modes of execution adopted which avoid the shedding of blood.] Both modes of execution may be adopted in order to avoid shedding the blood of the sinners; for in Bali, the ordinary way of despatching a criminal is to stab him to the heart with a creese (kris) or crooked Malay sword.[68.2] In the island of Celebes, as we saw, the blood of persons who have been guilty of certain sexual crimes is believed to blast the ground on which it falls;[68.3] so that it is natural in their case to resort to a bloodless mode of execution such as drowning or burning. In Mamoedjoe, a district on the west coast of Celebes, the incest of a father with his daughter or of a brother with his sister is punished by binding the culprits hand and foot, weighting them with stones, and flinging them into the sea.[68.4] Among the Bugineese of Southern Celebes persons of princely rank who have committed this crime are placed on a raft of bamboos and set floating away out to sea.[68.5] [Sidenote: Persons guilty of incest buried alive.] In Semendo, a district of Sumatra, the punishment for incest and murder used to be to bury the criminals alive. Before they were led to their doom, it was customary for the villagers to feast them, every family killing a fowl for the purpose. Then the whole population escorted the culprits to their grave outside the village and saw the earth shovelled in upon them. In the year 1864, at the village of Tandjong Imam, this doom was executed on a man and his deceased wife's sister, with whom he had been detected in an intrigue. "Great was my emotion and indignation," said the humane Dutch governor, {69} "when I stood by the grave of these poor wretches along with the unworthy chiefs who had sat on the bench of justice during the enforced absence of Pangeran Anom and pronounced this sentence. I told them in plain language that judges who pronounced such a sentence of death on grounds so trivial (the request of the family concerned) deserved themselves to undergo the same punishment." The Dutch Government has since issued stringent orders that no one henceforth is to be buried alive, and has threatened with death any person who shall dare to disregard its orders.[69.1] The same punishment for incest is, or used to be, inflicted by the Pasemhers, another tribe of Sumatra, but more merciful than the people of Semendo they

gave the culprits at least a chance for their life. The guilty pair were bound back to back and buried in a deep hole, but from the mouth of each a hollow bamboo communicated with the upper air; and if when the grave was opened after seven days the wretches were found to have survived a prolonged agony far worse than death, they were granted their life.[69.2] Nor was even this dreadful fate the worst that could befall the sinner who broke the rules of sexual morality in Sumatra. [Sidenote: Adulterers killed and eaten.] The Battas or Bataks of Central Sumatra condemned an adulterer to be killed and eaten; strictly speaking he should be speared to death first and eaten afterwards, but as the injured husband and his friends were commonly the judges and executioners, it sometimes happened that, passion proving too strong for a strict adherence to the letter of the law, they cut the flesh from his living body, ate it, and drank his blood, before it occurred to them to terminate his sufferings by a spear-thrust. However, an adulterer occasionally escaped with his life on the payment of a fine, always provided that his accomplice was not the wife of a chief; for in that case there was no help for it but he must be killed and eaten.[69.3]

Even trivial misdemeanours or acts which we should {70} deem perfectly innocent may draw condign punishment on the thoughtless, the imprudent, the light-hearted in the Indian Archipelago. [Sidenote: Extreme severity of the code of sexual morality in Lombok.] Thus we read that in the island of Lombok “the men are exceedingly jealous and very strict with their wives. A married woman may not accept a cigar or a sirih leaf from a stranger under pain of death. I was informed that some years ago one of the English traders had a Balinese woman of good family living with him--the connexion being considered quite honourable by the natives. During some festival this girl offended against the law by accepting a flower or some such trifle from another man. This was reported to the Rajah (to some of whose wives the girl was related), and he immediately sent to the Englishman’s house ordering him to give the woman up as she must be ‘krissed.’ In vain he begged and prayed, and offered to pay any fine the Rajah might impose, and finally refused to give her up unless he was forced to do so. This the Rajah did not wish to resort to, as he no doubt thought he was acting as much for the Englishman’s honour as for his own; so he appeared to let the matter drop. But some time afterwards he sent one of his followers to the house, who beckoned the girl to the door, and then saying, ‘The Rajah sends you this,’ stabbed her to the heart. More serious infidelity is punished still more cruelly, the woman and her paramour being tied back to back and thrown into the sea, where some large crocodiles are always on the watch to devour the bodies. One such execution took place while I was at Ampanam, but I took a long walk into the country to be out of the way till it was all over.”[70.1]

[Sidenote: The severity of the code based at bottom on superstition.] As the Malay peoples of the Indian Archipelago, from whom the foregoing examples are drawn, have reached a fair level of culture, it might perhaps be thought that the extreme severity with which they visit offences against their code of sexual morality springs from an excessive refinement of feeling rather than from a crude superstition; and no doubt it may well happen that extreme sensitiveness on the point of honour, of which the Malays are susceptible, contributes in many cases to sharpen the sword of justice {71} and add fresh force to the stroke. Yet under this delicacy of sentiment there appears to lie a deep foundation of superstition, as we may see by the extraordinary and disastrous influence which in the opinion of these people sexual crime exerts, not so much on the criminals themselves, as on the whole realm of nature, drawing down deluges of rain from the clouds till the crops rot in the fields, shaking the solid earth beneath men’s feet, and blowing up into flames the slumbering fires of the volcano, till the sky is darkened at noon by a black canopy of falling ashes and illumined at night by the sullen glow of the molten lava shot forth from the subterranean furnace.[71.1] [Sidenote: A similar severity in sexual matters observed among the Australian aborigines, the lowest of existing savages.] And however much an over-refinement of feeling may be invoked to explain the more than Puritanical severity of the Malay moral code in sexual matters, no such explanation can be applied to the like emotion of horror which similar offences excite among the savage aborigines of Australia, the lowest and the least refined probably of all the races of men about whom we possess accurate information. These rude savages also treated with rigorous severity all breaches of that widely ramified network of prohibitions in which throughout the Australian continent, before it fell under English rule, the two sexes lived immeshed. The whole community of a tribe or nation was commonly subdivided into a number of minute bodies, which we are accustomed to call classes or clans according to the principle on which they were variously constituted. No man might marry a woman of his own class or clan, and in most tribes his freedom of choice was still further limited by complex rules of marriage and descent which excluded him from seeking a wife in many more subdivisions of the tribe, and sometimes compelled him to look for her only in one out of them all. And the ordinary penalty for any violation of these rules was death. The offender was lucky who escaped with his life and a body more or less riddled with spear wounds. [Sidenote: Severe punishments inflicted for sexual offences among the aborigines of Victoria.] Thus one who knew the aborigines of Victoria well in the old days, before they were first contaminated and then destroyed by contact with European civilization, tells us that “no marriage or betrothal is permitted without the approval {72} of the chiefs of each party, who first ascertain that no ‘flesh’ relationship exists, and even then their permission must be rewarded by presents. So strictly are the laws of marriage carried out, that, should any signs of affection and courtship be observed between those of ‘one flesh,’ the brothers, or

male relatives of the woman beat her severely; the man is brought before the chief, and accused of an intention to fall into the same flesh, and is severely reprimanded by the tribe. If he persists, and runs away with the object of his affections, they beat and 'cut his head all over'; and if the woman was a consenting party she is half killed. If she dies in consequence of her punishment, her death is avenged by the man's receiving an additional beating from her relatives. No other vengeance is taken, as her punishment is legal. A child born under such conditions is taken from the parents, and handed over to the care of its grandmother, who is compelled to rear it, as no one else will adopt it. It says much for the morality of the aborigines and their laws that illegitimacy is rare, and is looked upon with such abhorrence that the mother is always severely beaten by her relatives, and sometimes put to death and burned. Her child is occasionally killed and burned with her. The father of the child is also punished with the greatest severity, and occasionally killed. Should he survive the chastisement inflicted upon him, he is always shunned by the woman's relatives, and any efforts to conciliate them with gifts are spurned, and his presents are put in the fire and burned. Since the advent of the Europeans among them, the aborigines have occasionally disregarded their admirable marriage laws, and to this disregard they attribute the greater weakness and unhealthiness of their children."[72.1]

[Sidenote: Severe punishments inflicted for sexual offences in the Wakelbura tribe of Queensland.] Again, in the Wakelbura tribe of eastern Queensland the law was extremely strict as to unlawful connexions or elopements between persons too nearly related to each other. Such persons might be, for example, those whom we call cousins both on the father's and the mother's side, as well as those who belonged to a forbidden class. If such a man {73} carried off a woman who had been betrothed to another, he would be pursued not only by the male relations of the woman and of her betrothed husband, but also by the men of his own tribal subdivision, whom he had outraged by his breach of the marriage law; and wherever they overtook him, he would have to fight them all. His own brothers would challenge him to fight by throwing boomerangs or other weapons at him; and if he did not accept the challenge, they would turn on the woman and cripple or kill her with their weapons, unless she could escape into the bush. Nay, the woman's own mother would cut and perhaps slay her with her own hands. Sooner or later the ravisher had to engage in single combat with the man he had injured. Both were fully armed with shield, spear, boomerang and knife. When they had exhausted their missiles, they closed on each other with their knives, a dense ring of blacks generally forming round the combatants to see fair play. In such a fight the man who had broken the tribal law always came off worst; for even if he got the better of his adversary, the other men and even his own brothers would attack him and probably gash him with their knives. Fatal stabs were sometimes given in these fights, but more usually, it would seem, the onlookers interfered and wrested the weapons from the two combatants before they proceeded to extremities. In any case the woman who had eloped was terribly mauled with knives, and if she survived the ordeal was restored to the man whom she had deserted.[73.1]

[Sidenote: Severe punishment inflicted for sexual offences among the aborigines of other parts of Australia.] Among the tribes in the central parts of North-West Queensland, if a man eloped with a single woman whom he might lawfully marry, but who for any reason was forbidden to him by the tribal council, he had on returning to camp with his wife to run the gauntlet of the outraged community, who hacked his buttocks and shoulders with knives, beat his head and limbs with sticks and boomerangs, and pricked the fleshy parts of his thighs with spears, taking care, however, not to inflict fatal injuries, lest they should incur blood revenge. But if the woman with whom the man had eloped {74} was of a class into which he might not marry, both the culprits were put to death, the relations on both sides tacitly consenting to the execution.[74.1] In the Yuin tribe of New South Wales, if a man eloped with a woman of his own tribal subdivision, all the men would pursue him; and if he refused to give the woman up, the sorcerer of the place would probably say to his men, "This man has done very wrong, you must kill him"; whereupon somebody would thrust a spear into him, his relatives not interfering lest the same fate should befall them.[74.2] The same punishment was inflicted for the same offence by the Wotjobaluk tribe of North-Western Victoria; but their western neighbours, the Mukjarawaint tribe, not content with killing the guilty man, cut off the flesh off his thighs and upper arms, roasted and ate it, his own brother partaking of the cannibal meal. As for the rest of the body, they chopped it up small and left it lying on a log. The same custom is said to have been observed by the Jupagalk tribe.[74.3] Among many tribes of Western Australia, as well as of other parts of that continent, persons who bear the same class-name may not marry. Any such marriage is regarded as incest and rigorously punished. For example, "the union of Boorong and Boorong is to the natives the union of brother and sister, although there may be no real blood relationship between the pair, and a union of that kind is looked upon with horror, and the perpetrators very severely punished and separated, and if the crime is repeated they are both killed."[74.4] On the other side of the continent the Kamilaroi of New South Wales similarly inflicted condign punishment on both the culprits who persisted in marrying each other contrary to the tribal law; the male relations of the man killed him, and the female relations of the woman killed her. [Sidenote: Penalty of death inflicted for the crime of speaking to a mother-in-law.] The Kamilaroi of the Gwydir River went further; they {75} killed any man who so much as spoke to or held any communication with his mother-in-law,[75.1] for one of the most stringent laws of savage etiquette is that

which prohibits any direct social intercourse between a man and his wife's mother. The law has been variously explained,[75.2] but a large body of evidence points to the conclusion that this custom of mutual avoidance is simply a precaution to prevent improper relations between the two. Hence a brief consideration of it is appropriate in this place; for to all appearance the custom, though it may be wholesome and beneficial in practice, has originated purely in superstition. But before giving my reasons for thinking so it may be well, for the sake of those who are unfamiliar with savage etiquette, to illustrate the practice itself by a few examples.[75.3]

[Sidenote: The custom of avoiding a mother-in-law and other relations by marriage among the Boloki of the Congo.] Speaking of the Boloki, a Bantu tribe of the Upper Congo, an experienced missionary, the Rev. John H. Weeks, writes as follows: "Perhaps this will be the best place in which to make a few remarks on the mother-in-law. She and her son-in-law may never look on each other's face. I have often heard a man say, 'So-and-so, your mother-in-law is coming,' and the person addressed would run into my house and hide himself until his wife's mother had gone by. They can sit at a little distance from each other, with their backs to one another, and talk over affairs when necessary. _Bokilo_ means mother-in-law, daughter-in-law, brother-in-law, father-in-law, sister of mother-in-law, brother of father-in-law, wife of wife's brother, and in fact any relation-in-law. _Bokilo_, the noun, is derived from _kila_ = to forbid, prohibit, taboo, and indicates that all bearing the relationship of {76} _bokilo_ can have no intimate relationship with one another, for it is regarded as incestuous; and it is according to native ideas just as wrong for a daughter-in-law to speak or look at her husband's father, as for the son-in-law to speak or look at his wife's mother. Some have told me that this was to guard against all possibility of cohabitation, 'For a person you never look at you never desire.' Others have said, 'Well, don't you see, my wife came from her womb.' I am strongly inclined to the opinion that the former is the real reason."[76.1]

From this statement it appears that a man and his wife's mother are not the only persons who are bound to avoid each other in society; the same rule of social avoidance is incumbent on a man and his son's wife, and on many other persons of opposite sex who are connected with each other by marriage; and in regard to all such persons it is held that any intimate relationship between them would be incestuous. Hence we see, what is important to bear in mind, that the rule of social avoidance incumbent on a man and his wife's mother is by no means solitary of its kind, and cannot be considered apart from a large number of similar rules of avoidance observed between other persons. [Sidenote: The custom of avoiding relations by marriage among the Batamba of Busoga.] The same large extension of the rule appears in the customs of the Batamba, a Bantu tribe of Busoga, a country on the north side of the Lake Victoria Nyanza. A Catholic missionary, who has laboured among the Batamba for nine years, describes their practice in this matter as follows:--

"There is a very strange custom which may be considered here. If a son marries or if a daughter does the same, then if they are grown up, from the day the son or daughter marries, the mother, father of both parties, the brothers and sisters of both parties are not allowed to sleep under the same roof. If a man marries, then he builds a house for himself, and should his parents live with him, or his brothers and sisters, then they must have a separate house near by. They are not forbidden to go in and visit him or her, but are not allowed to sleep there. The reason is this. They say that otherwise sickness is caused, and this {77} is called _endivade ya buko_, the sickness of relationship, literally taken. The sickness is called _bujugumiro_, trembling, from the verb _kujugumira_, to shiver or tremble. This cannot be got out of their heads, and no amount of talking or arguing will convince them of the opposite. I have attended many cases of this disease and I have not known one to recover.

"Again, the father and mother of the bride and bridegroom, the aunts and uncles of bride and bridegroom may no more shake hands or touch in any way the bride and bridegroom, or else the same disease, _bujugumiro_, will follow. Of course much less will they commit themselves between each other for the fear of the same reason. And it is never heard of that a brother and sister, aunt and nephew, niece and uncle have ever committed themselves seriously. They are so afraid of the disease they say will follow, that, as a man here over seventy years of age tells me, he has never in his whole life heard of such a misbehaviour. The people say, '_Jekiyinzika_ = it is impossible for such a thing to happen.' And no doubt one is struck with the care they take. The disease following does not come as a punishment from the gods, but they say, '_Endwada ejja yokka_, the illness comes by itself.'"[77.1]

[Sidenote: Avoidance of blood relations as well as of connexions by marriage.] From the foregoing account it appears that among the Batamba the rules of social avoidance are observed between blood-relations of opposite sexes, such as brothers and sisters, uncles and nieces, aunts and nephews, as well as between connexions by marriage. This is a further extension of the rule of social avoidance which it is important to bear in mind. We shall recur to it presently. For our present purpose it deserves also to be noticed that breaches of the custom are believed to be punished by a disease of trembling or shivering, which, though it probably springs purely from the imagination of the culprits, nevertheless appears to be always fatal. Further, we learn that the mere apprehension of this disease acts as a most efficient check upon improper relations between persons who are connected with each other by blood or marriage.

[Sidenote: The custom of avoiding mother-in-law and own daughter among the Akamba of British East Africa.] Among the Akamba, a Bantu tribe of British East Africa, {78} "if a man meets his mother-in-law in the road they both hide their faces and pass by in the bush on opposite sides of the path. If a man did not observe this custom and at any time wanted to marry another wife, it would prove a serious stigma, and parents would have nothing to do with him. Moreover, if a wife heard that her husband had stopped and spoken to her mother in the road, she would leave him. If a man has business he wishes to discuss with his mother-in-law, he goes to her hut at night, and she will talk to him from behind the partition in the hut.… If a girl of the age of puberty meets her father in the road, she hides as he passes, nor can she ever go and sit near him in the village until the day comes when he tells her that it has been arranged for her to marry a certain man. After marriage she does not avoid her father in any way."[78.1] Thus among the Akamba a man must avoid his own marriageable, but unmarried, daughter exactly as he avoids his wife's mother; but the custom of avoidance ceases when his daughter marries. This extension of the rule to a man's own daughter, and its limitation to the time during which the girl is nubile but single, are most significant, and point plainly to a fear of improper relations between father and daughter. To that point we shall return shortly.

[Sidenote: The custom of avoiding parents-in-law among various tribes of Central and East Africa.] Among the Bakerewe, a Bantu people inhabiting a large and fertile island in Lake Victoria Nyanza, "the wife, whether the first (_omukuru_) or the last (_omwenga_), must always belong to a family other than that of the husband, for marriages are not contracted between relations. Never in any case will the new household establish itself in the immediate neighbourhood of the wife's parents. The reason is that the son-in-law (_omukwerima_) and his mother-in-law (_mazara_), according to their customs, may not see each other nor look upon each other; hence in order not to run the risk of breaking a rule to which everybody attaches grave importance, they go as far away as possible."[78.2] Among some tribes of Eastern Africa which formerly acknowledged the suzerainty of the sultan of Zanzibar, before a young couple had children {79} they might meet neither their father-in-law nor their mother-in-law. To avoid them they must make a long roundabout. But if they could not do that, they must throw themselves on the ground and hide their faces till the father-in-law or mother-in-law had passed by.[79.1]

[Sidenote: The custom of avoiding parents-in-law among the tribes of British Central Africa and Northern Rhodesia.] Among the Anyanja, a Bantu people of British Central Africa, "a man used never to speak to his mother-in-law till after the birth of his first son. Neither a man nor his wife will eat in company of their mother or father-in-law until after birth of a child. If a man sees his mother-in-law eat, he has insulted her and is expected to pay damages. If a man meets his mother-in-law coming along the road and does not recognise her, she will fall down on the ground as a sign, when he will run away. In the same way a father-in-law will signal to his daughter-in-law; the whole idea being that they are unworthy to be noticed till they have proved that they can beget children."[79.2] However, if a wife should prove barren for three years, the rules of avoidance between the young couple and their parents-in-law cease to be observed.[79.3] Hence the custom of avoidance among these people is associated in some way with the wife's fertility. So among the Awemba, a Bantu tribe of Northern Rhodesia, "if a young man sees his mother-in-law coming along the path, he must retreat into the bush and make way for her, or if she suddenly comes upon him he must keep his eyes fixed on the ground, and only after a child is born may they converse together."[79.4] Among the Angoni, another Bantu tribe of British Central Africa, it would be a gross breach of etiquette if a man were to enter his son-in-law's house; he may come within ten paces of the door, but no nearer. A woman may not even approach her son-in-law's house, and she is never allowed to speak to him. Should they meet accidentally on a path, the son-in-law gives way and makes a circuit to avoid encountering his mother-in-law face to face.[79.5] Here then we {80} see that a man avoids his son-in-law as well as his mother-in-law, though not so strictly.

[Sidenote: The custom of avoiding mother-in-law and wife of wife's brother among the Thonga of Delagoa Bay.] Among the Thonga, a Bantu tribe about Delagoa Bay, when a man meets his mother-in-law or her sister on the road, he steps out of the road into the forest on the right hand side and sits down. She does the same. Then they salute each other in the usual way by clapping their hands. After that they may talk to each other. When a man is in a hut, his mother-in-law dare not enter it, but must sit down outside without seeing him. So seated she may salute him, "Good morning, son of So-and-so." But she would not dare to pronounce his name. However, when a man has been married many years, his mother-in-law has less fear of him, and will even enter the hut where he is and speak to him. But among the Thonga the woman whom a man is bound by custom to avoid most rigidly is not his wife's mother, but the wife of his wife's brother. If the two meet on a path, they carefully avoid each other; he will step out of the way and she will hurry on, while her companions, if she has any, will stop and chat with him. She will not enter the same boat with him, if she can help it, to cross a river. She will not eat out of the same dish. If he speaks to her, it is with constraint and embarrassment. He will not enter her hut, but will crouch at the door and address her in a voice trembling with emotion. Should there be no one else to bring him food, she will do it reluctantly, watching his hut and putting the food inside the door when he is

absent. It is not that they dislike each other, but that they feel a mutual, a mysterious fear.[80.1] However, among the Thonga, the rules of avoidance between connexions by marriage decrease in severity as time passes. The strained relations between a man and his wife's mother in particular become easier. He begins to call her "Mother" and she calls him "Son." This change even goes so far that in some cases the man may go and dwell in the village of his wife's parents, especially if he has children and the children are grown up.[80.2] Again, among the Ovambo, a Bantu {81} people of German South-West Africa, a man may not look at his future mother-in-law while he talks with her, but is bound to keep his eyes steadily fixed on the ground. In some cases the avoidance is even more stringent; if the two meet unexpectedly, they separate at once. But after the marriage has been celebrated, the social intercourse between mother-in-law and son-in-law becomes easier on both sides.[81.1]

[Sidenote: The custom of avoiding the mother-in-law among other than the Bantu tribes of Africa.] Thus far our examples of ceremonial avoidance between mother-in-law and son-in-law have been drawn from Bantu tribes. But in Africa the custom, though apparently most prevalent and most strongly marked among peoples of the great Bantu stock, is not confined to them. Among the Masai of British East Africa, "mothers-in-law and their sons-in-law must avoid one another as much as possible; and if a son-in-law enters his mother-in-law's hut she must retire into the inner compartment and sit on the bed, whilst he remains in the outer compartment; they may then talk. Own brothers-in-law and sisters-in-law must also avoid one another, though this rule does not apply to half-brothers-in-law and sisters-in-law."[81.2] So, too, among the Bogos, a tribe on the outskirts of Abyssinia, a man never sees the face of his mother-in-law and never pronounces her name; the two take care not to meet.[81.3] Among the Donaglas a husband after marriage "lives in his wife's house for a year, without being allowed to see his mother-in-law, with whom he enters into relations only on the birth of his first son."[81.4] In Darfur, when a youth has been betrothed to a girl, however intimate he may have been with her parents before, he ceases to see them until the ceremony has taken place, and even avoids them in the street. They, on their part, hide their faces, if they happen to meet him unexpectedly.[81.5]

{82}

[Sidenote: The custom of avoiding relations by marriage in Sumatra and New Guinea.] To pass now from Africa to other parts of the world, among the Looboos, a primitive tribe in the tropical forests of Sumatra, custom forbids a woman to be in her father-in-law's company and a man to be in his mother-in-law's society. For example, if a man meets his daughter-in-law, he should cross over to the other side of the road to let her pass as far as possible from him; but if the way is too narrow, he takes care in time to get out of it. But no such reserve is prescribed between a father-in-law and his son-in-law, or between a mother-in-law and her daughter-in-law.[82.1] Among the Bukaua, a Melanesian tribe of German New Guinea, the rules of avoidance between persons connected by marriage are very stringent; they may not touch each other or mention each other's names. But contrary to the usual practice the avoidance seems to be quite as strict between persons of the same sex as between males and females. At least the writer who reports the custom illustrates it chiefly by the etiquette which is observed between a man and his daughter's husband. When a man eats in presence of his son-in-law, he veils his face; but if nevertheless his son-in-law should see his open mouth, the father-in-law is so ashamed that he runs away into the wood. If he gives his son-in-law anything, such as betel or tobacco, he will never put it in his hand, but pours it on a leaf, and the son-in-law fetches it away. If father-in-law and son-in-law both take part in a wild boar hunt, the son-in-law will abstain from seizing or binding the boar, lest he should chance to touch his father-in-law. If, however, through any accident their hands or backs should come into contact, the father-in-law is extremely horrified, and a dog must be at once killed, which he gives to his son-in-law for the purpose of wiping out the stain on his honour. If the two should ever fall out about anything, the son-in-law will leave the village and his wife, and will stay away in some other place till his father-in-law, for his daughter's sake, calls him back. A man in like manner will never touch his sister-in-law.[82.2]

{83}

[Sidenote: The custom of avoiding relations by marriage among the Indian tribes of America.] Among the low savages of the Californian peninsula a man was not allowed for some time to look into the face of his mother-in-law or of his wife's other near relations; when these women were present he had to step aside or hide himself.[83.1] Among the Indians of the Isla del Malhado in Florida a father-in-law and mother-in-law might not enter the house of their son-in-law, and he on his side might not appear before his father-in-law and his relations. If they met by accident they had to go apart to the distance of a bowshot, holding their heads down and their eyes turned to the earth. But a woman was free to converse with the father and mother of her husband.[83.2] Among the Indians of Yucatan, if a betrothed man saw his future father-in-law or mother-in-law at a distance, he turned away as quickly as possible, believing that a meeting with them would prevent him from begetting children.[83.3] Among the Arawaks of British Guiana a man may never see the face of his wife's mother. If she is in the house with him, they must be separated by a screen or partition-wall; if she travels with him in a canoe, she steps in first, in order that she may turn her back to him.[83.4] Among

the Caribs “the women never quit their father’s house, and in that they have an advantage over their husbands in as much as they may talk to all sorts of people, whereas the husband dare not converse with his wife’s relations, unless he is dispensed from this observance either by their tender age or by their intoxication. They shun meeting them and make great circuits for that purpose. If they are surprised in a place where they cannot help meeting, the person addressed turns his face another way so as not to be obliged to see the person, whose voice he is compelled to hear.”[83.5] {84} Among the Araucanian Indians of Chili a man’s mother-in-law refuses to speak to or even to look at him during the marriage festivity, and “the point of honour is, in some instances, carried so far, that for years after the marriage the mother never addresses her son-in-law face to face; though with her back turned, or with the interposition of a fence or a partition, she will converse with him freely.”[84.1]

[Sidenote: The custom of avoiding relations by marriage cannot be separated from the similar custom of avoiding relations by blood; both are probably precautions to prevent improper relations between the sexes.] It would be easy to multiply examples of similar customs of avoidance between persons closely connected by marriage, but the foregoing may serve as specimens. Now in order to determine the meaning of such customs it is very important to observe that similar customs of avoidance are practised in some tribes not merely between persons connected with each other by marriage, but also between the nearest blood relations of different sexes, namely, between parents and children and between brothers and sisters;[84.2] and the customs are so alike that it seems difficult or impossible to separate them and to offer one explanation of the avoidance of connexions by marriage and another different explanation of the avoidance of blood relations. Yet this is what is done by some who attempt to explain the customs of avoidance; or rather they confine their attention wholly to connexions by marriage, or even to mothers-in-law alone, while they completely ignore blood relations, although in point of fact it is the avoidance of blood relations which seems to furnish the key to the problem of such avoidances in general. The true explanation of all such customs of avoidance appears to be, as I have already indicated, that they are precautions designed to remove the temptation to sexual intercourse between persons whose marriage union is for any reason repugnant to the moral sense of the community. This explanation, while it has been rejected by theorists at home, {85} has been adopted by some of the best observers of savage life, whose opinion is entitled to carry the greatest weight.[85.1]

[Sidenote: Mutual avoidance of mother and son, of father and daughter, and of brother and sister among the Battas.] That a fear of improper intimacy even between the nearest blood relations is not baseless among races of a lower culture seems proved by the testimony of a Dutch missionary in regard to the Battas or Bataks of Sumatra, a people who have attained to a fairly high degree of barbaric civilization. The Battas “observe certain rules of avoidance in regard to near relations by blood or marriage; and we are informed that such avoidance springs not from the strictness but from the looseness of their moral practice. A Batta, it is said, assumes that a solitary meeting of a man with a woman leads to an improper intimacy between them. But at the same time he believes that incest or the sexual intercourse of near relations excites the anger of the gods and entails calamities of all sorts. Hence near relations are obliged to avoid each other lest they should succumb to temptation. A Batta, for example, would think it shocking were a brother to escort his sister to an evening party. Even in the presence of others a Batta brother and sister feel embarrassed. If one of them comes into the house, the other will go away. Further, a man may never be alone in the house with his daughter, nor a mother with her son. A man may never speak to his mother-in-law nor a woman to her father-in-law. The Dutch missionary who reports these customs adds that he is sorry to say that from what he knows of the Battas he believes the maintenance of most of these rules to be very necessary. For the same reason, he tells us, as soon as Batta lads have reached the age of puberty they are no longer allowed to sleep in the family house but are sent away to pass the night in a separate building (_djambon_); and similarly as soon as a man loses his wife by death he is excluded from the house.”[85.2]

{86}

[Sidenote: Mutual avoidance of mother and son and of brother and sister among the Melanesians.] In like manner among the Melanesians of the Banks’ Islands and the New Hebrides a man must not only avoid his mother-in-law; from the time when he reaches or approaches puberty and has begun to wear clothes instead of running about naked, he must avoid his mother and sisters, and he may no longer live in the same house with them; he takes up his quarters in the clubhouse of the unmarried males, where he now regularly eats and sleeps. He may go to his father’s house to ask for food, but if his sister is within he must go away before he eats; if she is not there, he may sit down near the door and eat. If by chance brother and sister meet in the path, she runs away or hides. If a boy, walking on the sands, perceives footprints which he knows to be those of his sister, he will not follow them, nor will she follow his. This mutual avoidance lasts through life. Not only must he avoid the persons of his sisters, but he may not pronounce their names or even use a common word which happens to form part of any one of their names. In like manner his sisters eschew the use of his name and of all words which form part of it. Strict, too, is a boy’s reserve towards his mother from the

time when he begins to wear clothes, and the reserve increases as he grows to manhood. It is greater on her side than on his. He may go to the house and ask for food and his mother may bring it out for him, but she will not give it to him; she puts it down for him to take. If she calls to him to come, she speaks to him in the plural, in a more distant manner; “Come ye,” she says, not “Come thou.” If they talk together she sits at a little distance and turns away, for she is shy of her grown-up son. “The meaning of all this,” as Dr. Codrington observes, “is obvious.”[86.1] [Sidenote: Mutual avoidance of a man and his mother-in-law among the Melanesians.] When a Melanesian man of the Banks’ Islands marries, he is bound in like manner to avoid his mother-in-law. “The rules of avoidance are very strict and minute. As regards the avoidance of the person, a man will not come near his wife’s mother; the avoidance is mutual; if the two chance to meet in a path, the woman will step out of it and stand with her back turned till he has gone by, or perhaps if it be more {87} convenient he will move out of the way. At Vanua Lava, in Port Patteson, a man would not follow his mother-in-law along the beach, nor she him, until the tide had washed out the footsteps of the first traveller from the sand. At the same time a man and his mother-in-law will talk at a distance.”[87.1]

[Sidenote: It is significant that mutual avoidance between blood relations of opposite sexes begins at or near puberty.] It seems obvious that these Melanesian customs of avoidance are the same, and must be explained in the same way whether the woman whom a man shuns is his wife’s mother or his own mother or his sister. Now it is highly significant that just as among the Akamba of East Africa the mutual avoidance of father and daughter only begins when the girl has reached puberty, so among the Melanesians the mutual avoidance of a boy on the one side and of his mother and sisters on the other only begins when the boy has reached or approached puberty. Thus in both peoples the avoidance between the nearest blood relations only commences at the dangerous age when sexual connexion on both sides begins to be possible. It seems difficult, therefore, to evade the conclusion that the mutual avoidance is adopted for no other reason than to diminish as far as possible the chances of sexual unions which public opinion condemns as incestuous. But if that is the reason why a young Melanesian boy, on the verge of puberty, avoids his own mother and sisters, it is natural and almost necessary to infer that it is the same reason which leads him, as a full-grown and married man, to eschew the company of his wife’s mother.

[Sidenote: Mutual avoidance of mother and son, of father and daughter, and of brother and sister in the Caroline Islands.] Similar customs of avoidance between mothers and sons, between fathers and daughters, and between brothers and sisters are observed by the natives of the Caroline Islands, and the writer who records them assigns the fear of incest as the motive for their observance. “The prohibition of marriage,” he says, “and of sexual intercourse between kinsfolk of the same tribe is regarded by the Central Caroline natives as a divine ordinance; its breach is therefore, in their opinion, punished by the higher powers with sickness or death. The law influences in a characteristic way the whole social life of the islanders, for efforts {88} are made to keep members of families of different sexes apart from each other even in their youth. Unmarried men and boys, from the time when they begin to speak, may therefore not remain by night in the huts, but must sleep in the _fel_, the assembly-house. In the evening their meal (_âkot_) is brought thither to them by their mothers or sisters. Only when a son is sick may his mother receive him in the hut and tend him there. On the other hand entrance to the assembly-house (_fel_) is forbidden to women and girls except on the occasion of the _pwarik_ festival; whereas female members of other tribes are free to visit it, although, so far as I could observe, they seldom make use of the permission. Unmarried girls sleep in the huts with their parents.

“These restrictions, which custom and tradition have instituted within the family, find expression also in the behaviour of the members of families toward each other. The following persons, namely, have to be treated with respect--the daughters by their father, the sons by their mother, the brothers by their sisters. In presence of such relations, as in the presence of a chief, you may not stand, but must sit down; if you are obliged on narrow paths to pass by one of them you must first obtain permission and then do it in a stooping or creeping posture. You allow them everywhere to go in front; you also avoid to drink out of the vessel which they have just used; you do not touch them, but keep always at a certain distance from them; the head especially is deemed sacred.”[88.1]

[Sidenote: Mutual avoidance of male and female cousins in some tribes.] In all these cases the custom of mutual avoidance is observed by persons of opposite sex who, though physically capable of sexual union, are forbidden by tradition and public opinion to have any such commerce with each other. Thus far the blood relations whom a man is forbidden to marry and compelled to avoid, are his own mother, his own daughter, and his own sisters. But to this list some people add a man’s female cousins or at least certain of them; for many races draw a sharp line of distinction between cousins according {89} as they are children of two brothers or of two sisters or of a brother and a sister, and while they permit or even prefer marriage with certain cousins, they absolutely forbid marriage with certain others. Now, it is highly significant that some tribes which forbid a man to marry certain of his cousins also compel him to adopt towards them the same attitude of social reserve which in the same or other tribes a man is

obliged to observe towards his wife's mother, his own mother, and his own sisters, all of whom in like manner he is forbidden to marry. [Sidenote: Mutual avoidance of male and female cousins in New Ireland.] Thus among the tribes in the central part of New Ireland (New Mecklenburg) a male and a female cousin, the children of a brother and a sister respectively, are most strictly forbidden by custom to marry each other; indeed this prohibition is described as the most stringent of all; the usual saying in regard to such relations is, "The cousin is holy" (_i tábu ra kókup_). Now, in these tribes a man is not merely forbidden to marry his female cousin, the daughter of his father's sister or of his mother's brother; he must also avoid her socially, just as in other tribes a man must avoid his wife's mother, his own mother, his own daughter, and his own sisters. The cousins may not approach each other, they may not shake hands or even touch each other, they may not give each other presents, they may not mention each other's names; but they are allowed to speak to each other at a distance of some paces. These rules of avoidance, these social barriers erected between cousins, the children of a brother and a sister respectively, are interpreted most naturally and simply as precautions intended to obviate the danger of a criminal intercourse between persons whose sexual union would be regarded by public opinion with deep displeasure. Indeed the Catholic missionary, to whom we are indebted for the information, assumes this interpretation of the rules as if it were too obvious to call for serious discussion. He says that all the customs of avoidance "are observed as outward symbols of this prohibition of marriage"; and he adds that "were the outward sign of the prohibition of marriage, to which the natives cleave with genuine obstinacy, abolished or even weakened, there would be an immediate danger of the natives contracting such {90} marriages."[90.1] It seems difficult for a rational man to draw any other inference. If any confirmation were needed, it would be furnished by the fact that among these tribes of New Ireland brothers and sisters are obliged to observe precisely the same rules of mutual avoidance, and that incest between brother and sister is a crime which is punished with hanging; they may not come near each other, they may not shake hands, they may not touch each other, they may not give each other presents; but they are allowed to speak to each other at a distance of some paces. And the penalty for incest with a daughter is also death by hanging.[90.2]

[Sidenote: Mutual avoidance of certain male and female cousins among the Baganda; marriage or sexual intercourse forbidden between these cousins under pain of death.] Amongst the Baganda of Central Africa in like manner a man was forbidden under pain of death to marry or have sexual intercourse with his cousin, the daughter either of his father's sister or of his mother's brother; and such cousins might not approach each other, nor hand each other anything, nor enter the same house, nor eat out of the same dish. Were cousins to break these rules of social avoidance, in other words, if they were to approach each other or hand each other anything, it was believed that they would fall ill, that their hands would tremble, and that they would be unfit for any work.[90.3] Here, again, the prohibition of social intercourse was in all probability merely a precaution against sexual intercourse, for which the penalty was death. And the same may be said of the similar custom of avoidance which among these same Baganda a man had to observe towards his wife's mother. "No man might see his mother-in-law, or speak face to face with her; she covered her face, if she passed her son-in-law, and he gave her the path and made a detour, if he saw her coming. If she was in the house, he might not enter, but he was allowed to speak to her from a distance. This was said to be because he had seen her daughter's nakedness. If a son-in-law accidentally {91} saw his mother-in-law's breasts, he sent her a barkcloth in compensation, to cover herself, lest some illness, such as tremor, should come upon him. The punishment for incest was death; no member of a clan would shield a person guilty thereof; the offender was disowned by the clan, tried by the chief of the district, and put to death."[91.1]

[Sidenote: Marriage between certain cousins forbidden among some South African tribes but allowed among others.] The prohibition of marriage with certain cousins appears to be widespread among African peoples of the Bantu stock. Thus in regard to the Bantus of South Africa we read that "every man of a coast tribe regarded himself as the protector of those females whom we would call his cousins, second cousins, third cousins, and so forth, on the father's side, while some had a similar feeling towards the same relatives on the mother's side as well, and classified them all as sisters. Immorality with one of them would have been considered incestuous, something horrible, something unutterably disgraceful. Of old it was punished by the death of the male, and even now a heavy fine is inflicted upon him, while the guilt of the female must be atoned by a sacrifice performed with due ceremony by the tribal priest, or it is believed a curse will rest upon her and her issue…. In contrast to this prohibition the native of the interior almost as a rule married the daughter of his father's brother, in order, as he said, to keep property from being lost to his family. This custom more than anything else created a disgust and contempt for them by the people of the coast, who term such intermarriages the union of dogs, and attribute to them the insanity and idiocy which in recent times has become prevalent among the inland tribes."[91.2]

{92}

[Sidenote: Marriage between cousins allowed in some African tribes on condition that an expiatory sacrifice is offered.] Among the Thonga, a Bantu tribe about Delagoa Bay, marriages between cousins are as a rule prohibited, and it is believed that such unions are unfruitful. However, custom permits cousins to marry each other on condition that they perform an expiatory ceremony which is supposed to avert the curse of barrenness from the wife. A goat is sacrificed, and the couple are anointed with the green liquid extracted from the half-digested grass in the animal's stomach. Then a hole is cut in the goat's skin and through this hole the heads of the cousins are inserted. The goat's liver is then handed to them, quite raw, through the hole in the skin, and they must tear it out with their teeth without using a knife. Having torn it out, they eat it. The word for liver (_shibindji_) also means "patience," "determination." So they say to the couple, "You have acted with strong determination. Eat the liver now! Eat it in the full light of the day, not in the dark! It will be an offering to the gods." Then the family priest prays, saying: "You, our gods, So-and-so, look! We have done it in the daylight. It has not been done by stealth. Bless them, give them children!" When he has done praying, the assistants take all the half-digested grass from the goat's stomach and place it on the wife's head, saying, "Go and bear children!"[92.1] Among the Wagogo of German East Africa marriage is forbidden between cousins who are the children of two brothers or of two sisters, but is permitted between cousins who are the children of a brother and sister respectively. However, in this case it is usual for the wife's father to kill a sheep and put on a leather armlet, made presumably from the sheep's skin; otherwise it is supposed that the marriage would be unfruitful.[92.2] Thus the Wagogo, like the Thonga, imagine that the marriage of cousins is doomed to infertility unless an expiatory sacrifice is offered and a peculiar use made of the victim's skin. Again, the Akikuyu of British East Africa forbid the marriage of cousins and second cousins, the children and grandchildren of brothers and sisters. If such persons {93} married, they would commit a grave sin, and all their children would surely die; for the curse or ceremonial pollution (_thahu_) incurred by such a crime cannot be purged away. Nevertheless it sometimes happens that a man unwittingly marries a first or second cousin; for instance, if a part of the family moves away to another district, it may come about that a man makes the acquaintance of a girl and marries her before he discovers the relationship. In such a case, where the sin has been committed unknowingly, the curse can be averted by the performance of an expiatory rite. The elders take a sheep and place it on the woman's shoulders; there it is killed and the intestines taken out. Then the elders solemnly sever the intestines with a sharp splinter of wood taken from a bush of a certain sort (_mukeo_), "and they announce that they are cutting the clan _kutinyarurira_, by which they mean that they are severing the bond of relationship which exists between the pair. A medicine man then comes and purifies the couple."[93.1] In all these cases we may assume with a fair degree of probability that the old prohibition of marriage between cousins is breaking down, and that the expiatory sacrifice offered when such a marriage does take place is merely a salve to the uneasy conscience of those who commit or connive at a breach of the ancient taboo.

[Sidenote: The mutual avoidance of male and female cousins is probably a precaution against a criminal intimacy between them.] Thus the prohibition of marriage between cousins, and the rules of ceremonial avoidance observed in some tribes between persons who stand in that relationship to each other, appear both to spring from a belief, right or wrong, in the injurious effects of such unions and from a desire to avoid them. The mutual avoidance of the cousins is merely a precaution to prevent a closer and more criminal intimacy between them. If that is so, it furnishes a confirmation of the view that all the customs of ceremonial avoidance between blood relations or connexions by marriage of opposite sexes are based simply on a fear of incest.

[Sidenote: The mutual avoidance between a man and his wife's relations seems to be partly grounded on a fear of rendering the wife infertile.] The theory is perhaps confirmed by the observation that in some tribes the avoidance between a man and his {94} wife's mother lasts only until he has had a child by his wife;[94.1] while in others, though avoidance continues longer, it gradually wears away with time as the man and woman advance in years,[94.2] and in others, again, it is observed only between a man and his future mother-in-law, and comes to an end with his marriage.[94.3] These customs suggest that in the minds of the people who practise them there is a close connexion between the avoidance of the wife's relations and the dread of an infertile marriage. The Indians of Yucatan, as we saw, believe that if a betrothed man were to meet his future mother-in-law or father-in-law, he would thereby lose the power of begetting children. Such a fear seems to be only an extension by false analogy of that belief in the disastrous consequences of illicit sexual relations which we dealt with in an earlier part of this chapter,[94.4] and of which we shall have more to say presently.[94.5] From thinking, rightly or wrongly, that sexual intercourse between certain persons is fraught with serious dangers, the savage jumped to the conclusion that social intercourse between them may be also perilous by virtue of a sort of physical infection acting through simple contact or even at a distance; or if, in many cases, he did not go so far as to suppose that for a man merely to see or touch his mother-in-law sufficed to blast the fertility of his wife's womb, yet he may have thought, with much better reason, that intimate social converse between him and her might easily lead to something worse, and that to guard against such a possibility it was best to raise a strong barrier of etiquette between them. It is not, of course, to be supposed that these rules of avoidance were the result of deliberate legislation; rather they were the spontaneous and gradual growth of

feelings and thoughts of which the savages themselves perhaps had no clear consciousness. In what precedes I have merely attempted to sum up in language intelligible to civilized man the outcome of a long course of moral and social evolution.

These considerations perhaps obviate to some extent the only serious difficulty which lies in the way of the theory {95} here advocated. [Sidenote: The mutual avoidance between persons of the same sex was probably an extension by false analogy of the mutual avoidance between persons of different sexes.] If the custom of avoidance was adopted in order to guard against the danger of incest, how comes it that the custom is often observed towards persons of the same sex, for example, by a man towards his father-in-law as well as towards his mother-in-law? The difficulty is undoubtedly serious: the only way of meeting it that I can suggest is the one I have already indicated. We may suppose that the deeply rooted beliefs of the savage in the fatal effects of marriage between certain classes of persons, whether relations by blood or connexions by marriage, gradually spread in his mind so as to embrace the relations between men and men as well as between men and women; till he had worked himself into the conviction that to see or touch his father-in-law, for example, was nearly or quite as dangerous as to touch or have improper relations with his mother-in-law. It is no doubt easy for us to detect the flaw in this process of reasoning; but we should beware of casting stones at the illogical savage, for it is possible or even probable that many of our own cherished convictions are no better founded.

[Sidenote: The custom of mutual avoidance between near relations has probably had the effect of checking the practice of inbreeding.] Viewed from this standpoint the customs of ceremonial avoidance among savages assume a serious aspect very different from the appearance of arbitrariness and absurdity which they are apt to present to the civilized observer who does not look below the surface of savage society. So far as these customs have helped, as they probably have done, to suppress the tendency to inbreeding, that is, to the marriage of near relations, we must conclude that their effect has been salutary, if, as many eminent biologists hold, long-continued inbreeding is injurious to the stock, whether animal or vegetable, by rendering it in the end infertile.[95.1] However, men of science are as yet by no means agreed as to the results of consanguineous marriages, and a living authority on the subject has recently closed a review of the evidence as follows: “When we take into account such evidence as there is from animals and plants, and such studies as those of Huth,[95.2] and {96} the instances and counter-instances of communities with a high degree of consanguinity, we are led to the conclusion that the prejudices and laws of many peoples against the marriage of near kin rest on a basis not so much biological as social.”[96.1] Whatever may be the ultimate verdict of science on this disputed question, it will not affect the result of the present enquiry, which merely affirms the deep and far-reaching influence which in the long course of human history superstition has exercised on morality. Whether the influence has on the whole been for good or evil does not concern us. It suffices for our purpose to shew that superstition has been a crutch to morality, whether to support it in the fair way of virtue or to precipitate it into the miry pit of vice. To return to the point from which we wandered into this digression, we must leave in suspense the question whether the Australian savages were wise or foolish who forbade a man under pain of death to speak to his mother-in-law.

[Sidenote: Other examples of the severe punishment of sexual crime.] I will conclude this part of my subject with a few more instances of the extreme severity with which certain races have visited what they deemed improper connexions between the sexes.

[Sidenote: The Indians of Brazil.] Among the Indians who inhabited the coast of Brazil near Rio de Janeiro about the middle of the sixteenth century, a married woman who gave birth to an illegitimate child was either killed or abandoned to the caprice of the young men who could not afford to keep a wife. Her child was buried alive; for they said that were he to grow up he would only serve to perpetuate his mother’s disgrace; he would not be allowed to go to war with the rest for fear of the misfortunes and disasters he might draw down upon them, and no one would eat any food, whether venison, fish, or what not, which the miserable outcast had touched.[96.2] [Sidenote: The natives of Ruanda.] In Ruanda, a district of Central Africa, down to recent years any unmarried woman who was got with child used to be put to death with her baby, whether born or unborn. A spot at the mouth of the Akanyaru river was the place of execution, {97} where the guilty women and their innocent offspring were hurled into the water. As usual, this Puritanical strictness of morality has been relaxed under European influence; illegitimate children are still killed, but their mothers escape with the fine of a cow.[97.1] [Sidenote: The Saxons.] Among the Saxons down to the days of St. Boniface the adulteress or the maiden who had dishonoured her father’s house was compelled to hang herself, was burned, and her paramour hung over the blazing pile; or she was scourged or cut to pieces with knives by all the women of the village till she was dead.[97.2] [Sidenote: The Southern Slavs.] Among the Slav peoples of the Balkan peninsula women convicted of immoral conduct used to be stoned to death. About the year 1770 a young betrothed couple were thus executed near Cattaro in Dalmatia, because the girl was found to be with child. The youth offered to marry her, and the priest begged that the sentence of death might be commuted to perpetual banishment; but the people declared that they would not have a bastard born among them; and the two fathers of the

luckless couple threw the first stones at them. When Miss M. Edith Durham related this case to some Montenegrin peasantry, they all said that in the old days stoning was the proper punishment for unchaste women; the male paramours were shot by the relations of the girls whom they had seduced. When “that modern Messalina,” Queen Draga of Servia, was murdered, a decent peasant woman remarked that “she ought to be under the cursed stone heap” (_pod prokletu gomilu_). The country-folk of Montenegro, who heard the news of the murder from Miss Durham, “looked on it as a cleansing--a casting out of abominations--and genuinely believed that Europe would commend the deed, and that the removal of this sinful woman would bring prosperity to the land.”[97.3] Even down to the second half of the {98} nineteenth century in cases of seduction among the Southern Slavs the people proposed to stone both the culprits to death.[98.1] This happened, for example, in Herzegovina in the year 1859, when a young man named Milutin seduced or (to be more exact) was seduced by three unmarried girls and got them all with child. The people sat in judgment upon the sinners, and, though an elder proposed to stone them all, the court passed a milder sentence. The young man was to marry one of the girls, to rear the infants of the other two as his legitimate children, and next time there was a fight with the Turks he was to prove his manhood by rushing unarmed upon the enemy and wresting their weapons from them, alive or dead. The sentence was fulfilled to the letter, though many years passed before the culprit could carry out the last part of it. However, his time came in 1875, when Herzegovina revolted against the Turks. Then Milutin ran unarmed upon a regiment of the enemy and found among the Turkish bayonets a hero’s death.[98.2] Even now the Old Catholics among the South Slavs believe that a village in which a seducer is not compelled to marry his victim will be punished with hail and excessive rain. For this article of faith, however, they are ridiculed by their enlightened Catholic neighbours, who hold the far more probable view that thunder and lightning are caused by the village priest to revenge himself for unreasonable delays in the payment of his salary. A heavy hail-storm has been known to prove almost fatal to the local incumbent, who was beaten within an inch of his life by his enraged parishioners.[98.3]

[Sidenote: Inference from the severe punishments inflicted for sexual offences.] It is difficult to believe that in these and similar cases the community would inflict such severe punishment for sexual offences if it did not believe that its own safety, and not merely the interest of a few individuals, was imperilled thereby.

{99}

[Sidenote: Why should illicit relations between the sexes be thought to disturb the balance of nature?] If now we ask why illicit relations between the sexes should be supposed to disturb the balance of nature and particularly to blast the fruits of the earth, a partial answer may be conjecturally suggested. It is not enough to say that such relations are displeasing to the gods, who punish indiscriminately the whole community for the sins of a few. For we must always bear in mind that the gods are creations of man’s fancy; he fashions them in human likeness, and endows them with tastes and opinions which are merely vast cloudy projections of his own. To affirm, therefore, that something is a sin because the gods will it so, is only to push the enquiry one stage farther back and to raise the further question, Why are the gods supposed to dislike and punish these particular acts? [Sidenote: The reason why the gods of savages are supposed to punish sexual crimes so severely may perhaps be found in a mistaken belief that irregularities of the human sexes prevent the reproduction of edible animals and plants and thereby strike a fatal blow at the food supply.] In the case with which we are here concerned, the reason why so many savage gods prohibit adultery, fornication, and incest under pain of their severe displeasure may perhaps be found in the analogy which many savage men trace between the reproduction of the human species and the reproduction of animals and plants. The analogy is not purely fanciful, on the contrary it is real and vital; but primitive peoples have given it a false extension in a vain attempt to apply it practically to increasing the food supply. They have imagined, in fact, that by performing or abstaining from certain sexual acts they thereby directly promoted the reproduction of animals and the multiplication of plants.[99.1] All such acts and abstinences, it is obvious, are purely superstitious and wholly fail to effect the desired {100} result. They are not religious but magical; that is, they compass their end, not by an appeal to the gods, but by manipulating natural forces in accordance with certain false ideas of physical causation. In the present case the principle on which savages seek to propagate animals and plants is that of magical sympathy or imitation: they fancy that they assist the reproductive process in nature by mimicking or performing it among themselves. Now in the evolution of society such efforts to control the course of nature directly by means of magical rites appear to have preceded the efforts to control it indirectly by appealing to the vanity and cupidity, the good-nature and pity of the gods; in short, magic seems to be older than religion.[100.1] In most races, it is true, the epoch of unadulterated magic, of magic untinged by religion, belongs to such a remote past that its existence, like that of our ape-like ancestors, can be a matter of inference only; almost everywhere in history and the world we find magic and religion side by side, at one time allies, at another enemies, now playing into each other’s hands, now cursing, objurgating, and vainly attempting to exterminate one another. On the whole the lower intelligences cling closely, though secretly, to magic, while the higher intelligences have discerned the vanity of its pretensions and turned to religion instead. The result has been that beliefs and rites which were purely magical in origin often contract in course of time a religious character; they

are modified in accordance with the advance of thought, they are translated into terms of gods and spirits, whether good and beneficent, or evil and malignant. We may surmise, though we cannot prove, that a change of this sort has come over the minds of many races with regard to sexual morality. At some former time, perhaps, straining a real analogy too far, they believed that those relations of the human sexes which for any reason they regarded as right and natural had a tendency to promote sympathetically the propagation of animals and plants and thereby to ensure a supply of food for the community; while on the contrary they may have imagined that those relations of the human sexes which for any reason {101} they deemed wrong and unnatural had a tendency to thwart and impede the propagation of animals and plants and thereby to diminish the common supply of food.

[Sidenote: Such a belief would account both for the horror with which many savages regard such crimes, and for the severity with which they punish them.] Such a belief, it is obvious, would furnish a sufficient motive for the strict prohibition of what were deemed improper relations between men and women; and it would explain the deep horror and detestation with which sexual irregularities are viewed by many, though certainly not by all, savage tribes. For if improper relations between the human sexes prevent animals and plants from multiplying, they strike a fatal blow at the existence of the tribe by cutting off its supply of food at the roots. No wonder, therefore, that wherever such superstitions have prevailed the whole community, believing its very existence to be put in jeopardy by sexual immorality, should turn savagely on the culprits, and beat, burn, drown or otherwise exterminate them in order to rid itself of so dangerous a pollution. And when with the advance of knowledge men began to perceive the mistake they had made in imagining that the commerce of the human sexes could affect the propagation of animals and plants, they would still through long habit be so inured to the idea of the wickedness of certain sexual relations that they could not dismiss it from their minds, even when they discerned the fallacious nature of the reasoning by which they had arrived at it. The old practice would therefore stand, though the old theory had fallen: the old rules of sexual morality would continue to be observed, but if they were to retain the respect of the community, it was necessary to place them on a new theoretical basis. That basis, in accordance with the general advance of thought, was supplied by religion. Sexual relations which had once been condemned as wrong and unnatural because they were supposed to thwart the natural multiplication of animals and plants and thereby to diminish the food supply, would now be condemned because it was imagined that they were displeasing to gods or spirits, those stalking-horses which savage man rigs out in the cast-off clothes of his still more savage ancestors. The moral practice would therefore remain the same, though its theoretical basis had been shifted from magic to religion. In this or some such way as this {102} we may conjecture that the Karens, Dyaks, and other savages reached those curious conceptions of sexual immorality and its consequences which we have been considering. But from the nature of the case the development of moral theory which I have sketched is purely hypothetical and hardly admits of verification.

[Sidenote: But the reason why savages came to regard certain sexual relations as irregular and immoral remains obscure.] However, even if we assume for a moment that the savages in question reached their present view of sexual immorality in the way I have surmised, there still remains the question, How did they originally come to regard certain relations of the sexes as immoral? For clearly the notion that such immorality interferes with the course of nature must have been secondary and derivative: people must on independent grounds have concluded that certain relations between men and women were wrong and injurious before they extended the conclusion by false analogy to nature. The question brings us face to face with the deepest and darkest problem in the history of society, the problem of the origin of the laws which still regulate marriage and the relations of the sexes among civilized nations; for broadly speaking the fundamental laws which we recognize in these matters are recognized also by savages, with this difference, that among many savages the sexual prohibitions are far more numerous, the horror excited by breaches of them far deeper, and the punishment inflicted on the offenders far sterner than with us. The problem has often been attacked, but never solved. Perhaps it is destined, like so many riddles of that Sphinx which we call nature, to remain for ever insoluble. At all events this is not the place to broach so intricate and profound a discussion. I return to my immediate subject.

[Sidenote: Sexual immorality is thought by many savages to injure the delinquents themselves, their offspring, and their innocent spouses.] In the opinion of many savages the effect of sexual immorality is not merely to disturb, directly or indirectly, the course of nature by blighting the crops, causing the earth to quake, volcanoes to vomit fire, and so forth: the delinquents themselves, their offspring, or their innocent spouses are supposed to suffer in their own persons for the sin that has been committed. Thus among the Baganda of Central Africa “adultery was also regarded as a danger to children; it was thought that women who were guilty of it {103} during pregnancy caused the child to die, either prior to birth, or at the time of birth. Sometimes the guilty woman would herself die in childbed; or, if she was safely delivered, she would have a tendency to devour her child, and would have to be guarded lest she should kill it.”[103.1] “When there was a case of retarded delivery, the relatives attributed it to adultery; they made the woman confess the name of the man with whom she had had intercourse, and if she died, her husband was fined by the members of her clan, for they said: ‘We did not give our daughter to you for the purpose of adultery, and you should have guarded

her.’ In most cases, however, the medicine-men were able to save the woman’s life, and upon recovery she was upbraided, and the man whom she accused was heavily fined.”[103.2] The Baganda thought that the infidelity of the father as well as of the mother endangered the life of the child. For “it was also supposed that a man who had sexual intercourse with any woman not his wife, during the time that any one of his wives was nursing a child, would cause the child to fall ill, and that unless he confessed his guilt and obtained from the medicine-man the necessary remedies to cancel the evil results, the child would die.”[103.3] The common childish ailment which was thought to be caused by the adultery of the father or mother was called _amakiro_, and its symptoms were well recognized: they consisted of nausea and general debility, and the only cure for them was a frank confession by the guilty parent and the performance of a magical ceremony by the medicine-man.[103.4]

[Sidenote: Disastrous effects of adultery on adulteress and her child.] Similar views as to the disastrous effects of adultery on mother and child seem to be widespread among Bantu tribes. Thus among the Awemba of Northern Rhodesia, when both mother and child die in childbirth, great horror is expressed by all, who assert that the woman must assuredly have committed adultery with many men to suffer such a fate. They exhort her even with her last breath to name the {104} adulterer; and whoever is mentioned by her is called the “murderer” (_musoka_) and has afterwards to pay a heavy fine to the injured husband. Similarly if the child is born dead and the mother survives, the Awemba take it for granted that the woman has been unfaithful to her husband, and they ask her to name the murderer of her child, that is, the man whose guilty love has been the death of the babe.[104.1] In like manner the Thonga, a Bantu tribe of South Africa, about Delagoa Bay, are of opinion that if a woman’s travail pangs are unduly prolonged or she fails to bring her offspring to the birth, she must certainly have committed adultery, and they insist upon her making a clean breast as the only means of ensuring her delivery; should she suppress the name even of one of several lovers with whom she may have gone astray, the child cannot be born. So convinced are the women of the sufferings which adultery, if unacknowledged, entails on the guilty mother in childbed, that a woman who knows her child to be illegitimate will privately confess her sin to the midwife before she is actually brought to bed, in the hope thereby of alleviating and shortening her travail pangs.[104.2] [Sidenote: Sympathetic relation between an adulterer and the injured husband.] Further, the Thonga believe that adultery establishes a physical relationship of mutual sympathy between the adulterer and the injured husband such that the life of the one is in a manner bound up with the life of the other; indeed this relationship is thought to arise between any two men who have had sexual connexion with the same woman. As a native put it to a missionary, “They have met together in one life through the blood of that woman; they have drunk from the same pool.” To express it otherwise, they have formed a blood covenant with each other through the woman as intermediary. “This establishes between them a most curious mutual dependence: should one of them be ill, the other must not visit him; the patient might die. If he runs a thorn into his foot, the other must not help him to extract it. It is taboo. The wound would not heal. If he dies, his rival must not assist at his mourning or he would die {105} himself.” Hence if a man has committed adultery, as sometimes happens, with one of his father’s younger wives, and the father dies, his undutiful son may not take the part which would otherwise fall to him in the funeral rites; indeed should he attempt to attend the burial, his relations would drive him away in pity, lest by this mark of respect and perhaps of remorse he should forfeit his life.[105.1] [Sidenote: Injurious effects of adultery on the innocent husband, wife, or child.] In like manner the Akikuyu of British East Africa believe that if a son has adulterous intercourse with one of his father’s wives, the innocent father, not the guilty young scapegrace, contracts a dangerous pollution (_thahu_), the effect of which is to make him ill and emaciated or to break out into sores or boils, and even in all probability to die, if the danger is not averted by the timely intervention of a medicine-man.[105.2] The Anyanja of British Central Africa believe that if a man commits adultery while his wife is with child, she will die; hence on the death of his wife the widower is often roundly accused of having killed her by his infidelity.[105.3] Without going so far as this, the Masai of German East Africa hold that if a father were to touch his infant on the day after he had been guilty of adultery, the child would fall sick.[105.4] According to the Akamba of British East Africa, if a woman after giving birth to a child is false to her husband before her first menstruation, the child will surely die.[105.5] [Sidenote: Injurious effects of incest on the offspring.] The Akamba are also of opinion that if a woman is guilty of incest with her brother she will be unable to bring to the birth the seed which she has conceived by him. In that case the man must purge his sin by bringing a big goat to the elders, and the woman is ceremonially smeared with the contents of the {106} animal’s stomach.[106.1] Among the Washamba of German East Africa it happened that a married woman lost three children, one after the other, by death. A diviner being called in to ascertain the cause of this calamity, attributed it to incest of which she had been accidentally guilty with her father.[106.2]

[Sidenote: Wife’s infidelity at home thought to endanger the absent husband in the chase or the war.] Again, it appears to be a common notion with savages that the infidelity of a wife prevents her husband from killing game, and even exposes him to imminent risk of being himself killed or wounded by wild beasts. This belief is entertained by the Wagogo and other peoples of East Africa, by the Moxos Indians of Bolivia, and by Aleutian hunters of sea-otters. In such cases any mishap that befalls the husband

during the chase is set down by him to the score of his wife's misconduct at home; he returns in wrath and visits his ill-luck on the often innocent object of his suspicions even, it may be, to the shedding of her blood.[106.3] While the Huichol Indians of Mexico are away seeking for a species of cactus which they regard as sacred, their women at home are bound to be strictly chaste; otherwise they believe that they would be visited with illness and would endanger the success of the men's expedition.[106.4] An old writer on Madagascar tells us that though Malagasy women are voluptuous they will not allow themselves to be drawn into an intrigue while their husbands are absent at the wars, for they believe that infidelity at such a time would cause the absent spouse to be wounded or slain.[106.5] The Baganda of Central Africa held similar views as to the fatal effect which a wife's adultery at home might have on her absent husband at the wars; they thought that the gods resented her misconduct and withdrew their favour and protection from her warrior spouse, thus punishing the innocent instead of the guilty. Indeed, it was believed that {107} if a woman were even to touch a man's clothing while her husband was away with the army, it would bring misfortune on her husband's weapon, and might even cost him his life. The gods of the Baganda were most particular about women strictly observing the taboos during their husbands' absence and having nothing to do with other men all that time. On his return from the war a man tested his wife's fidelity by drinking water from a gourd which she handed to him before he entered his house. If she had been unfaithful to him during his absence, the water was supposed to make him ill; hence should it chance that he fell sick after drinking the draught, his wife was at once clapped into the stocks and tried for adultery; and if she confessed her guilt and named her paramour, the offender was heavily fined or even put to death.[107.1] Similarly among the Bangala or the Boloki of the Upper Congo, "when men went to fight distant towns their wives were expected not to commit adultery with such men as were left in the town, or their husbands would receive spear wounds from the enemy. The sisters of the fighters would take every precaution to guard against the adultery of their brothers' wives while they were on the expedition."[107.2] So among the Haida Indians of the Queen Charlotte Islands, while the men were away at the wars, their wives "all slept in one house to keep watch over each other; for, if a woman were unfaithful to her husband while he was with a war-party, he would probably be killed."[107.3] If only King David had held this belief he might have contented himself with a single instead of a double crime, and need not have sent his Machiavellian order to put the injured husband in the forefront of the battle.[107.4]

[Sidenote: Injurious effect of wife's infidelity on her husband.] The Zulus imagine that an unfaithful wife who touches her husband's furniture without first eating certain herbs causes him to be seized with a fit of coughing of which he soon dies. Moreover, among the Zulus "a man who has {108} had criminal intercourse with a sick person's wife is prohibited from visiting the sick-chamber; and, if the sick person is a woman, any female who has committed adultery with her husband must not visit her. They say that, if these visits ever take place, the patient is immediately oppressed with a cold perspiration and dies. This prohibition was thought to find out the infidelities of the women and to make them fear discovery."[108.1] [Sidenote: African chiefs thought to be injuriously affected by the incontinence of their subjects.] For a similar reason, apparently, during the sickness of a Caffre chief his tribe was bound to observe strict continence under pain of death.[108.2] The notion seems to have been that any act of incontinence would through some sort of magical sympathy prove fatal to the sick chief. The Ovakumbi, a tribe in the south of Angola, think that the carnal intercourse of young people under the age of puberty would cause the king to die within the year, if it were not severely punished. The punishment for such a treasonable offence used to be death.[108.3] Similarly, in the kingdom of Congo, when the sacred pontiff, called the Chitomé, was going his rounds throughout the country, all his subjects had to live strictly chaste, and any person found guilty of incontinence at such times was put to death without mercy. They thought that universal chastity was essential to the preservation of the life of the pontiff, whom they revered as the head of their religion and their common father. Accordingly when he was abroad he took care to warn his faithful subjects by a public crier, that no man might plead ignorance as an excuse for a breach of the law.[108.4]

[Sidenote: Injurious effects of adultery on the adulteress.] Speaking of the same region of West Africa, an old writer tells us that "conjugal chastity is singularly respected among these people; adultery is placed in the list of the greatest crimes. By an opinion generally received, the women are persuaded that if they were to render themselves guilty of infidelity, the greatest misfortunes would overwhelm {109} them, unless they averted them by an avowal made to their husbands, and in obtaining their pardon for the injury they might have done."[109.1] [Sidenote: Dangerous pollution supposed to be incurred by unchastity.] The Looboos of Sumatra think that an unmarried young woman who has been got with child falls thereby into a dangerous state called _looï_, which is such that she spreads misfortune wherever she goes. Hence when she enters a house, the people try to drive her out by force.[109.2] Amongst the Sulka of New Britain unmarried people who have been guilty of unchastity are believed to contract thereby a fatal pollution (_sle_) of which they will die, if they do not confess their fault and undergo a public ceremony of purification. Such persons are avoided: no one will take anything at their hands: parents point them out to their children and warn them not to go near them. The infection which they are supposed to spread is apparently physical rather than moral in its nature; for

special care is taken to keep the paraphernalia of the dance out of their way, the mere presence of persons so polluted being thought to tarnish the paint on the instruments. Men who have contracted this dangerous taint rid themselves of it by drinking sea-water mixed with shredded coco-nut and ginger, after which they are thrown into the sea. Emerging from the water they put off the dripping clothes which they wore during their state of defilement and cast them away. This purification is believed to save their lives, which otherwise must have been destroyed by their unchastity.[109.3] Among the Buduma of Lake Chad, in Central Africa, at the present day “a child born out of wedlock is looked on as a disgrace, and must be drowned. If this is not done, great misfortunes {110} will happen to the tribe. All the men will fall sick, and the women, cows and goats will become barren.”[110.1]

[Sidenote: Conclusion.] These examples may suffice to shew that among many races sexual immorality, whether in the form of adultery, fornication, or incest, is believed of itself to entail, naturally and inevitably, without the intervention of society, most serious consequences not only on the culprits themselves, but also on the community, often indeed to menace the very existence of the whole people by destroying the food supply. I need hardly remind you that all these beliefs are entirely baseless; no such consequences flow from such acts; in short, the beliefs in question are a pure superstition. Yet we cannot doubt that wherever this superstition has existed it must have served as a powerful motive to deter men from adultery, fornication, and incest. If that is so, then I think I have proved my third proposition, which is, that among certain races and at certain times superstition has strengthened the respect for marriage, and has thereby contributed to the stricter observance of the rules of sexual morality both among the married and the unmarried.

V. RESPECT FOR HUMAN LIFE

{111}

[Sidenote: Superstition as a prop to the security of human life.] I pass now to my fourth and last proposition, which is, that among certain races and at certain times superstition has strengthened the respect for human life and has thereby contributed to the security of its enjoyment.

[Sidenote: The fear of ghosts.] The particular superstition which has had this salutary effect is the fear of ghosts, especially the ghosts of the murdered. The fear of ghosts is widespread, perhaps universal, among savages; it is hardly extinct among ourselves. If it were extinct, some learned societies might put up their shutters. Dead or alive, the fear of ghosts has certainly not been an unmixed blessing. Indeed it might with some show of reason be maintained that no belief has done so much to retard the economic and thereby the social progress of mankind as the belief in the immortality of the soul; for this belief has led race after race, generation after generation, to sacrifice the real wants of the living to the imaginary wants of the dead. The waste and destruction of life and property which this faith has entailed are enormous and incalculable. [Sidenote: Disastrous consequences entailed by the fear of the dead.] Without entering into details I will illustrate by a single example the disastrous economic, political, and moral consequences which flow from that systematic destruction of property which the fear of the dead has imposed on many races. Speaking of the Patagonians, the well-informed and intelligent traveller d’Orbigny observes: “They have no laws, no punishments inflicted on the guilty. Each lives as he pleases, and the greatest thief is the most highly esteemed, because he is the most dexterous. A motive {112} which will always prevent them from abandoning the practice of theft, and at the same time will always present an obstacle to their ever forming fixed settlements, is the religious prejudice which, on the death of one of their number, obliges them to destroy his property. A Patagonian, who has amassed during the whole of his life an estate by thieving from the whites or exchanging the products of the chase with neighbouring tribes, has done nothing for his heirs; all his savings are destroyed with him, and his children are obliged to rebuild their fortunes afresh,--a custom which, I may observe in passing, is found also among the Tamanaques of the Orinoco, who ravage the field of the deceased and cut down the trees which he has planted;[112.1] and among the Yuracares, who abandon and shut up the house of the dead, regarding it as a profanation to gather a single fruit from the trees of his field. It is easy to see that with such customs they can nourish no real ambition since their needs are limited to themselves; it is one of the causes of their natural indolence and is a motive which, so long as it exists, will always impede the progress of their civilization. Why should they trouble themselves about the future when they have nothing to hope from it? The present is all in all in their eyes, and their only interest is individual; the son will take no care of his father’s herd, since it will never come into his possession; he busies himself only with his own affairs and soon turns his thoughts to looking after himself and getting a livelihood. This custom has certainly something to commend it from the moral point of view in so far as it destroys all the motives for that covetousness in heirs which is too often to be seen in our cities. The desire or the hope of a speedy death of their parents cannot exist, since the parents leave absolutely nothing to their children; but on the other hand, if the Patagonians had preserved hereditary properties, they would without doubt have been to-day in possession of numerous herds, and would

necessarily have been more formidable to the whites, since their power in that case would have been more than doubled, whereas their present habits will infallibly leave them in a stationary state, from which nothing but a radical change {113} will be able to deliver them."[113.1] Thus poverty, indolence, improvidence, political weakness, and all the hardships of a nomadic life are the miserable inheritance which the fear of the dead entails on these wretched Indians. Heavy indeed is the toll which superstition exacts from all who pass within her gloomy portal.

[Sidenote: Fear of the ghosts of the slain a check on murder.] But I am not here concerned with the disastrous and deplorable consequences, the unspeakable follies and crimes and miseries, which have flowed in practice from the theory of a future life. My business at present is with the more cheerful side of the subject, with the wholesome, though groundless, terror which ghosts, apparitions, and spectres strike into the breasts of hardened ruffians and desperadoes. So far as such persons reflect at all and regulate their passions by the dictates of prudence, it seems plain that a fear of ghostly retribution, of the angry spirit of their victim, must act as a salutary restraint on their disorderly impulses; it must reinforce the dread of purely secular punishment and furnish the choleric and malicious with a fresh motive for pausing before they imbrue their hands in blood. This is so obvious, and the fear of ghosts is so notorious, that both might perhaps be taken for granted, especially at this late hour of the evening. But for the sake of completeness I will mention a few illustrative facts, taking them almost at random from distant races in order to indicate the wide diffusion of this particular superstition. I shall try to shew that while all ghosts are feared, the ghosts of slain men are especially dreaded by their slayers.

[Sidenote: Ancient Greek belief as to the anger of a ghost at his slayer.] The ancient Greeks believed that the soul of any man who had just been killed was angry with his slayer and troubled him; hence even an involuntary homicide had to {114} depart from his country for a year until the wrath of the dead man had cooled down; nor might the slayer return until sacrifice had been offered and ceremonies of purification performed. If his victim chanced to be a foreigner, the homicide had to shun the country of the dead man as well as his own.[114.1] The legend of the matricide Orestes, how he roamed from place to place pursued and maddened by the ghost of his murdered mother, reflects faithfully the ancient Greek conception of the fate which overtakes the murderer at the hands of the ghost.[114.2]

[Sidenote: Among the Greeks a manslayer was dreaded and shunned because he was thought to be haunted by the angry and dangerous ghost of his victim.] But it is important to observe that not only does the hag-ridden homicide go in terror of his victim's ghost; he is himself an object of fear and aversion to the whole community on account of the angry and dangerous spirit which dogs his steps. It was probably more in self-defence than out of consideration for the manslayer that Attic law compelled him to quit the country. This comes out clearly from the provisions of the law. For in the first place, on going into banishment the homicide had to follow a prescribed road:[114.3] obviously it would have been hazardous to let him stray about the country with a wrathful ghost at his heels. In the second place, if another charge was brought against a banished homicide, he was allowed to return to Attica to plead in his defence, but he might not set foot on land; he had to speak from a ship, and even the ship might not cast anchor or put out a gangway. The judges avoided all contact with the culprit, for they judged the case sitting or standing on the shore.[114.4] Plainly the intention of this rule was literally to insulate the slayer, lest by touching Attic earth even indirectly through the anchor or the gangway he should blast it by a sort of electric shock, as we might say; though doubtless the Greeks would have said that the blight was wrought by contact with the ghost, by a sort of effluence of death. For the same reason if such a man, sailing the {115} sea, happened to be wrecked on the coast of the country where his crime had been committed, he was allowed to camp on the shore till a ship came to take him off, but he was expected to keep his feet in sea-water all the time,[115.1] evidently to neutralise the ghostly infection and prevent it from spreading to the soil. For the same reason, when the turbulent people of Cynaetha in Arcadia had perpetrated a peculiarly atrocious massacre and had sent envoys to Sparta, all the Arcadian states through which the envoys took their way ordered them out of the country; and after their departure the Mantineans purified themselves and their belongings by sacrificing victims and carrying them round the city and the whole of their land.[115.2] So when the Athenians had heard of a massacre at Argos, they caused purificatory offerings to be carried round the public assembly.[115.3]

[Sidenote: The legend of Orestes reflects the Greek horror of a manslayer.] No doubt the root of all such observances was a fear of the dangerous ghost which haunts the murderer and against which the whole community as well as the homicide himself must be on its guard. The Greek practice in these respects is clearly mirrored in the legend of Orestes; for it is said that the people of Troezen would not receive him in their houses until he had been purified of his guilt,[115.4] that is, until he had been rid of his mother's ghost. The Akikuyu of British East Africa think that if a man who has killed another comes and sleeps at a village and eats with a family in their hut, the persons with whom he has eaten contract a dangerous pollution which might prove fatal to them were it not removed in time by a medicine-man. The very skin on which the homicide slept has absorbed the taint and might infect any

one else who slept on it. So a medicine-man is sent for to purify the hut and its occupants.[115.5] [Sidenote: Manslayers purged of the stain of human blood by being smeared with the blood of pigs.] The {116} Greek mode of purifying a homicide was to kill a sucking pig and wash the hands of the guilty man in its blood: until this ceremony had been performed the manslayer was not allowed to speak.[116.1] Among the hill-tribes near Rajamahal in Bengal, if two men quarrel and blood be shed, the one who cut the other is fined a hog or a fowl, "the blood of which is sprinkled over the wounded person, to purify him, and to prevent his being possessed by a devil."[116.2] In this case the blood-sprinkling is avowedly intended to prevent the man from being haunted by a spirit; only it is not the aggressor but his victim who is supposed to be in danger and therefore to stand in need of purification. We have seen that among these and other savage tribes pig's blood is sprinkled on persons and things as a mode of purifying them from the pollution of sexual crimes.[116.3] Among the Cameroon negroes in West Africa accidental homicide can be expiated by the blood of an animal. The relations of the slayer and of the slain assemble. An animal is killed, and every person present is smeared with its blood on his face and breast. They think that the guilt of manslaughter is thus atoned for, and that no punishment will overtake the homicide.[116.4] In Car Nicobar a man possessed by devils is cleansed of them by being rubbed all over with pig's blood and beaten with leaves. The devils are supposed to be thus swept off like flies from the man's body to the leaves, which are then folded up and tied tightly with a special kind of string. A professional exorciser administers the beating, and at every stroke with the leaves he falls down with his face on the floor and calls out in a squeaky {117} voice, "Here is a devil." This ceremony is performed by night; and before daybreak all the packets of leaves containing the devils are thrown into the sea.[117.1] The Greeks similarly used laurel leaves as well as pig's blood in purificatory ceremonies.[117.2] In all such cases we may assume that the purification was originally conceived as physical rather than as moral, as a sort of detergent which washed, swept, or scraped the ghostly or demoniacal pollution from the person of the ghost-haunted or demon-possessed man. The motive for employing blood in these rites of cleansing is not clear. Perhaps the purgative virtue ascribed to it may have been based on the notion that the offended spirit accepts the blood as a substitute for the blood of the man or woman.[117.3] However, it is doubtful whether this explanation could cover all the cases in which blood is sprinkled as a mode of purification. Certainly it is odd, as the sage Heraclitus long ago remarked, that blood-stains should be thought to be removed by blood-stains, as if a man who had been bespattered with mud should think to cleanse himself by bespattering himself with more mud.[117.4] But the ways of man are wonderful and sometimes past finding out.

[Sidenote: The matricide Orestes is said to have recovered his wits by biting off one of his own fingers.] There was a curious story that after Orestes had gone mad through murdering his mother he recovered his wits by biting off one of his own fingers; the Furies of his murdered mother, which had appeared black to him before, appeared white as soon as he had mutilated himself in this way: it was as if the taste of his own blood sufficed to avert or disarm the wrathful ghost.[117.5] A hint of the way in which the blood may have been supposed to produce this result is furnished by the practice of some savages. [Sidenote: Manslayers commonly taste their victims' blood in order not to be haunted by their ghosts.] The Indians of Guiana believe that an avenger of blood who has slain his man must go mad unless he tastes the blood of his victim; the notion apparently is that the ghost drives him crazy, {118} just as the ghost of Clytemnestra did to Orestes, who was also, be it remembered, an avenger of blood. In order to avert this consequence the Indian manslayer resorts on the third night to the grave of his victim, pierces the corpse with a sharp-pointed stick, and withdrawing it sucks the blood of the murdered man. After that he goes home with an easy mind, satisfied that he has done his duty and that he has nothing more to fear from the ghost.[118.1] A similar custom was observed by the Maoris in battle. When a warrior had slain his foe in combat, he tasted his blood, believing that this preserved him from the avenging spirit (_atua_) of his victim; for they imagined that "the moment a slayer had tasted the blood of the slain, the dead man became a part of his being and placed him under the protection of the _atua_ or guardian-spirit of the deceased."[118.2] Thus in the opinion of these savages, by swallowing a portion of their victim they made him a part of themselves and thereby converted him from an enemy into an ally; they established, in the strictest sense of the words, a blood-covenant with him. The Aricara Indians also drank the blood of their slain foes and proclaimed the deed by the mark of a red hand on their faces.[118.3] The motive for this practice may have been, as with the Maoris, a desire to appropriate and so disarm the ghost of an enemy. In antiquity some of the Scythians used to drink the blood of the first foes they killed; and they also tasted the blood of the friends with whom they made a covenant, for "they take that to be the surest pledge of good faith."[118.4] [Sidenote: Homicides supposed to go mad unless they taste the blood of their victim.] The motive of the two customs was probably the same. "To the present day, when a person of another tribe has been slain by a Nandi, the blood must be carefully washed off the spear or sword into a cup made of grass, and drunk by the slayer. If this is not done it is thought that the man will become frenzied."[118.5] So {119} among some tribes of the Lower Niger "it is customary and necessary for the executioner to lick the blood that is on the blade"; moreover "the custom of licking the blood off the blade of a sword by which a man has been killed in war is common to all these tribes, and the explanation given me by the Ibo, which is generally accepted, is, that if this was not done, the act of killing would so affect the strikers as to cause them to run amok

among their own people; because the sight and smell of blood render them absolutely senseless as well as regardless of all consequences. And this licking the blood is the only sure remedy, and the only way in which they can recover themselves."[119.1] So, too, among the Shans of Burma "it was the curious custom of executioners to taste the blood of their victims, as they believed if this were not done illness and death would follow in a short time. In remote times Shan soldiers always bit the bodies of men killed by them in battle."[119.2] Strange as it may seem, this truly savage superstition exists apparently in Italy to this day. There is a widespread opinion in Calabria that if a murderer is to escape he must suck his victim's blood from the reeking blade of the dagger with which he did the deed.[119.3] We can now perhaps understand why the matricide Orestes was thought to have recovered his wandering wits as soon as he had bitten off one of his fingers. By tasting his own blood, which was also that of his victim, since she was his mother, he might be supposed to form a blood-covenant with the ghost and so to convert it from a foe into a friend.
[Sidenote: Various precautions taken by manslayers against the ghosts of their victims.] The Kabyles of North Africa think that if a murderer leaps seven times over his victim's grave within three or seven days of the murder, he will be quite safe. Hence the fresh grave of a murdered man is carefully guarded.[119.4] The Lushai {120} of North-Eastern India believe that if a man kills an enemy the ghost of his victim will haunt him and he will go mad, unless he performs a certain ceremony which will make him master of the dead man's soul in the other world. The ceremony includes the sacrifice of an animal, whether a pig, a goat, or a mithan.[120.1] Among the Awemba of Northern Rhodesia, "according to a superstition common among Central African tribes, unless the slayers were purified from blood-guiltiness they would become mad. On the night of return no warrior might sleep in his own hut, but lay in the open _nsaka_ in the village. The next day, after bathing in the stream and being anointed with lustral medicine by the doctor, he could return to his own hearth, and resume intercourse with his wife."[120.2] In all such cases the madness of the slayer is probably attributed to the ghost of the slain, which has taken possession of him.

[Sidenote: The custom of secluding and purifying homicides is intended to protect them against the angry spirits of the slain, which are thought to madden their slayers.] That the Greek practice of secluding and purifying a homicide was essentially an exorcism, in other words, that its aim was to ban the dangerous ghost of his victim, is rendered practically certain by the similar rites of seclusion and purification which among many savage tribes have to be observed by victorious warriors with the avowed intention of securing them against the spirits of the men whom they have slain in battle. These rites I have illustrated elsewhere,[120.3] but a few cases may be quoted here by way of example. Thus among the Basutos "ablution is especially performed on return from battle. It is absolutely necessary that the warriors should rid themselves, as soon as possible, of the blood they have shed, or the shades of their victims would pursue them incessantly, and disturb their slumbers. They go in a procession, and in full armour, to the nearest stream. At the moment they enter the water a diviner, placed higher up, throws some purifying substances into the current."[120.4] According to another account of the Basuto custom, "warriors {121} who have killed an enemy are purified. The chief has to wash them, sacrificing an ox in the presence of the whole army. They are also anointed with the gall of the animal, which prevents the ghost of the enemy from pursuing them any farther."[121.1] Among the Thonga, a Bantu tribe of South Africa, about Delagoa Bay, "to have killed an enemy on the battle-field entails an immense glory for the slayers; but that glory is fraught with great danger. They have killed…. So they are exposed to the mysterious and deadly influence of the _nuru_ and must consequently undergo a medical treatment. What is the _nuru_? _Nuru_, the spirit of the slain which tries to take its revenge on the slayer. It haunts him and may drive him into insanity: his eyes swell, protrude and become inflamed. He will lose his head, be attacked by giddiness (_ndzululwan_) and the thirst for blood may lead him to fall upon members of his own family and to stab them with his assagay. To prevent such misfortunes, a special medication is required: the slayers must _lurulula tiyimpì ta bu_, take away the _nuru_ of their sanguinary expedition…. In what consists this treatment? The slayers must remain for some days at the capital. They are taboo. They put on old clothes, eat with special spoons, because their hands are 'hot,' and off special plates (_mireko_) and broken pots. They are forbidden to drink water. Their food must be cold. The chief kills oxen for them; but if the meat were hot it would make them swell internally 'because they are hot themselves, they are defiled (_ba na nsila_).' If they eat hot food, the defilement would enter into them. 'They are black (_ntima_). This black must be removed.' During all this time sexual relations are absolutely forbidden to them. They must not go home, to their wives. In former times the Ba-Ronga used to tattoo them with special marks from one eyebrow to the other. Dreadful medicines were inoculated in the incisions, and there remained pimples 'which gave them the appearance of a buffalo when it frowns.' After some days a medicine-man comes to purify them, 'to remove their black.' There seem to be various means of doing it, according to Mankhelu. Seeds of all kinds are put into a {122} broken pot and roasted, together with drugs and _psanyi_[122.1] of a goat. The slayers inhale the smoke which emanates from the pot. They put their hands into the mixture and rub their limbs with it, especially the joints…. Insanity threatening those who shed blood might begin early. So, already on the battle-field, just after their deed, warriors are given a preventive dose of the medicine by those who have killed on previous occasions…. The period of seclusion having been concluded by the final purification, all the implements used by the slayers during these days, and their old garments, are tied together and hung by a string to a tree, at some distance from the

capital, where they are left to rot."[122.2]

[Sidenote: With some savages temporary insanity seems to be really caused by the sight or even thought of blood.] The accounts of the madness which is apt to befall slayers seem too numerous and too consistent to be dismissed as pure fictions of the savage imagination. However we may reject the native explanation of such fits of frenzy, the reports point to a real berserker fury or unbridled thirst for blood which comes over savages when they are excited by combat, and which may prove dangerous to friends as well as to foes. The question is one on which students of mental disease might perhaps throw light. Meantime it deserves to be noticed that even the people who have staid at home and have taken no share in the bloody work are liable to fall into a state of frenzy when they hear the war-whoops which proclaim the approach of the victorious warriors with their ghastly trophies. Thus we are told that among the Bare'e-speaking Toradjas of Central Celebes, when these notes of triumph were heard in the distance the whole population of the village would turn out to meet and welcome the returning braves. At the mere sound some of those who had remained at home, especially women, would be seized with a frenzy, and rushing forth would bite the severed heads of the slain foes, and they were not to be brought to their senses till they had drunk palm wine or water out of the skulls. If the warriors returned empty-handed, these {123} furies would fall upon them and bite their arms. There was a regular expression for this state of temporary insanity excited by the sight or even the thought of human blood; it was called _merata lamoanja_ or _merata raoa_, "the spirit is come over them," by which was probably meant that the madness was caused by the ghosts of the slaughtered foes. When any of the warriors themselves suffered from this paroxysm of frenzy, they were healed by eating a piece of the brains or licking the blood of the slain.[123.1]

[Sidenote: Means taken by manslayers in Africa to rid themselves of the ghosts of their victims.] Among the Bantu tribes of Kavirondo, in British East Africa, when a man has killed an enemy in warfare he shaves his head on his return home, and his friends rub a medicine, which generally consists of cow's dung, over his body to prevent the spirit of the slain man from troubling him.[123.2] Here cow's dung serves these negroes as a detergent of the ghost, just as pig's blood served the ancient Greeks. Among the Wawanga, about Mount Elgon in British East Africa, "a man returning from a raid, on which he has killed one of the enemy, may not enter his hut until he has taken cow-dung and rubbed it on the cheeks of the women and children of the village and purified himself by the sacrifice of a goat, a strip of skin from the forehead of which he wears round the right wrist during the four following nights."[123.3] With the Ja-Luo of Kavirondo the custom is somewhat different. Three days after his return from the fight the warrior shaves his head. But before he may enter his village he has to hang a live fowl, head uppermost, round his neck; then the bird is decapitated and its head left hanging round his neck. Soon after his return a feast is made for the slain man, in order that his ghost may not haunt his slayer.[123.4] In some of these cases the slayer shaves his head, precisely as the matricide Orestes is said to have shorn his hair when he came to his senses.[123.5] From this Greek tradition we may infer with some probability that the hair of Greek homicides, {124} like that of these African warriors, was regularly cropped as one way of ridding them of the ghostly infection. Among the Ba-Yaka, a Bantu people of the Congo Free State, "a man who has been killed in battle is supposed to send his soul to avenge his death on the person of the man who killed him; the latter, however, can escape the vengeance of the dead by wearing the red tail-feathers of the parrot in his hair, and painting his forehead red."[124.1] Perhaps, as I have suggested elsewhere, this costume is intended to disguise the slayer from his victim's ghost.[124.2] [Sidenote: Precautions taken by the Natchez Indians.] Among the Natchez Indians of North America young braves who had taken their first scalps were obliged to observe certain rules of abstinence for six months. They might not sleep with their wives nor eat flesh; their only food was fish and hasty-pudding. If they broke these rules they believed that the soul of the man they had killed would work their death by magic.[124.3]

[Sidenote: Ghosts of the slain dreaded by the Kai of German New Guinea.] The Kai of German New Guinea stand in great fear of the ghosts of the men whom they have slain in war. On their way back from the field of battle or the scene of massacre they hurry in order to be safe at home or in the shelter of a friendly village before nightfall; for all night long the spirits of the dead are believed to dog the footsteps of their slayers, in the hope of coming up with them and recovering the lost portions of their souls which adhere with the clots of their blood to the spears and clubs that dealt them the death-blow. Only so can these poor restless ghosts find rest and peace. Hence the slayers are careful not to bring back the blood-stained weapons with them into the village; for that would be the first place where the ghosts would look for them. They hide them, therefore, in the forest at a safe distance from the village, where the ghosts can never find them; and when the spirits are weary of the fruitless search, they go away back to their dead bodies lying, it may be, among the blackened ruins of their {125} desolated home. Then the victors come forth, and taking up the weapons from their hiding-places, wash them clean of blood and bring them back to the village.[125.1] But "as more or less of the soul-stuff of their slain foes always sticks to the victors, none of their people may touch them after their return to the village. They are strictly shunned by their friends for several days. People go shyly out of their way. If any one in the village gets a pain in his

stomach, it is assumed that he has sat down on the place of one of the warriors. If somebody complains of toothache, he must have eaten a fruit which had been touched by one of the combatants. All the leavings of the men's food must be most carefully put out of the way, lest a pig should get at them, for that would be the death of the animal. Therefore the remains of their meals are burnt or buried. The warriors themselves cannot suffer much from the soul-stuff of the foes, because they treat themselves with the disinfecting sap of a creeper. But even so they are not secure against all the dangers that threaten them from this quarter."[125.2]

[Sidenote: Customs observed by manslayers in British New Guinea.] Among the tribes at the mouth of the Wanigela River, in British New Guinea, "a man who has taken life is considered to be impure until he has undergone certain ceremonies: as soon as possible after the deed he cleanses himself and his weapon. This satisfactorily accomplished, he repairs to his village and seats himself on the logs of sacrificial staging. No one approaches him or takes any notice whatever of him. A house is prepared for him which is put in charge of two or three small boys as servants. He may eat only toasted bananas, and only the centre portion of them--the ends being thrown away. On the third day of his seclusion a small feast is prepared by his friends, who also fashion some new perineal bands for him. This is called _ivi poro_. The next day the man dons all his best ornaments and badges for taking life, and sallies forth fully armed and parades the village. The next day a hunt is organised, and a kangaroo selected from the game captured. It is cut open and the spleen and liver rubbed over the back of the man. He then walks solemnly down to the {126} nearest water, and standing straddle-legs in it washes himself. All young untried warriors swim between his legs. This is supposed to impart his courage and strength to them. The following day, at early dawn, he dashes out of his house, fully armed, and calls aloud the name of his victim. Having satisfied himself that he has thoroughly scared the ghost of the dead man, he returns to his house. The beating of flooring boards and the lighting of fires is also a certain method of scaring the ghost. A day later his purification is finished. He can then enter his wife's house."[126.1] In this last case the true nature of such so-called purifications is clearly manifest: they are in fact rites of exorcism observed for the purpose of banning a dangerous spirit.

[Sidenote: Customs observed by murderers among the Omaha Indians.] Amongst the Omaha Indians of North America a murderer whose life was spared by the kinsmen of his victim had to observe certain stringent rules for a period which varied from two to four years. He must walk barefoot, and he might eat no warm food, nor raise his voice, nor look around. He had to pull his robe around him and to keep it tied at the neck, even in warm weather; he might not let it hang loose or fly open. He might not move his hands about, but had to keep them close to his body. He might not comb his hair, nor might it be blown about by the wind. No one would eat with him, and only one of his kindred was allowed to remain with him in his tent. When the tribe went hunting, he was obliged to pitch his tent about a quarter of a mile from the rest of the people, "lest the ghost of his victim should raise a high wind which might cause damage."[126.2] The reason here alleged for banishing the murderer from the camp of the hunters gives the clue to all the other restrictions laid on him: he was haunted by the ghost and therefore dangerous; hence people kept aloof from him, just as they are said to have done from the ghost-ridden Orestes.

Among the Chinook Indians of Oregon and Washington, "when a person has been killed, an old man who has a {127} guardian spirit is asked to work over the murderer. [Sidenote: Ceremonies observed by homicides among the Chinook Indians.] The old man takes coal and mixes it with grease. He puts it on to the face of the murderer. He gives him a head ring of cedar bark. Cedar bark is also tied around his ankles and knees and around his wrists. For five days he does not drink water. He does not sleep, and does not lie down. He always stands. At night he walks about and whistles on bone whistles. He always says '_ä ä ä_.' For five days he does not wash his face. Then on the next morning the old man washes his face. He takes off that coal. He removes the black paint from his face. He puts red paint on his face. A little coal is mixed with the red paint. The old man puts this again on to his face. Sometimes this is done by an old man, sometimes by an old woman. The cedar bark which was tied to his legs and arms is taken off and buckskin straps are tied around his arms and his legs. Now, after five days he is given water. He is given a bucket, out of which he drinks. Now food is roasted for him, until it is burned. When it is burned black it is given to him. He eats standing. He takes five mouthsful, and no more. After thirty days he is painted with new red paint. Good red paint is taken. Now he carries his head ring and his bucket to a spruce tree and hangs it on top of the tree. Then the tree will dry up. People never eat in company of a murderer. He never eats sitting, but always standing. When he sits down to rest he kneels on one leg. The murderer never looks at a child and must not see people while they are eating."[127.1] All these measures are probably intended to rid the murderer of the clinging ghost of his victim, and to keep him in quarantine till the riddance has been effected.

[Sidenote: Ghosts of slain kinsfolk, fellow-townsmen, and fellow-clansfolk especially dreaded.] While the spirit of a murdered man is thus feared by everybody, it is natural that it should be specially dreaded by those against whom for any reason he may be conceived to bear a grudge. For example, among the Yabim of German New Guinea, when the relations of a murdered man have accepted a bloodwit instead of avenging his death, they must allow the family of the victim to mark them with chalk on the brow.

Were this {128} not done, the ghost of their dead kinsman might come and trouble them for not doing their duty by him; he might drive away their pigs or loosen their teeth.[128.1] The ghosts of murdered kinsfolk and neighbours are naturally more formidable than those of foreigners and strangers; for their wrath is hotter and they have more opportunities of wreaking their anger on the hard-hearted friends who either did them to death with their own hands or left their blood unavenged. Indeed some people only fear the wraiths of such persons, and regard with indifference all other ghosts, let them mow and gibber as much as they like. Thus among the Boloki of the Upper Congo "a homicide is not afraid of the spirit of the man he has killed when the slain man belongs to any of the neighbouring towns, as disembodied spirits travel in a very limited area only; but when he kills a man belonging to his own town he is filled with fear lest the spirit shall do him some harm. There are no special rites that he can observe to free himself from these fears, but he mourns for the slain man as though he were a member of his own family. He neglects his personal appearance, shaves his head, fasts for a certain period, and laments with much weeping."[128.2] Again, a Kikuyu man does not incur ceremonial pollution (_thahu_) by the slaughter of a man of another tribe, nor even of his own tribe, provided his victim belongs to another clan; but if the slain man is a member of the same clan as his slayer, the case is grave indeed. However, it is possible by means of a ceremony to bind over the ghost to keep the peace. For this purpose the murderer and the oldest surviving brother of his victim are seated facing each other on two trunks of banana trees; here they are solemnly fed by two elders with vegetable food of all kinds, which has been provided for the purpose by their mothers and sprinkled with the contents of the stomach of a sacrificed sheep. Next day the elders proceed to the sacred {129} fig-tree (_mugumo_), which plays a great part in the religious rites of the Akikuyu. There they sacrifice a pig and deposit some of the fat, the intestines, and the more important bones at the foot of the tree, while they themselves feast on the more palatable parts of the animal. They think that the ghost of the murdered man will visit the tree that very night in the outward shape of a wild cat and consume the meat, and that this offering will prevent him from returning to the village and troubling the inhabitants.[129.1]

[Sidenote: Ghosts of the slain dreaded by the Toradjas of Central Celebes.] The Bare'e-speaking Toradjas of Central Celebes are greatly concerned about the souls of men who have been slain in battle. They appear to think that men who have been killed in war instead of dying by disease have not exhausted their vital energy and that therefore their departed spirits are more powerful than the common ruck of ghosts; and as on account of the unnatural manner of their death they cannot be admitted into the land of souls they continue to prowl about the earth, furious with the foes who have cut them off untimely in the prime of manhood, and demanding of their friends that they shall wage war on the enemy and send forth an expedition every year to kill some of them. If the survivors pay no heed to this demand of the bloodthirsty ghosts, they themselves are exposed to the vengeance of these angry spirits, who pay out their undutiful friends and relatives by visiting them with sickness and death. Hence with the Toradjas war is a sacred duty in which every member of the community is bound to bear a part; even women and children, who cannot wage real war, must wage mimic warfare at home by hacking with bamboo swords at an old skull of the enemy, while with their shrill voices they utter the war-whoop.[129.2] Thus among these people, as among many more tribes of savages, a belief in the immortality of {130} the soul has been one of the most fruitful causes of bloodshed by keeping up a perpetual state of war between neighbouring communities, who dare not make peace with each other for fear of mortally offending the spirits of the dead.[130.1]

[Sidenote: Ghosts of all who have died violent deaths are dangerous. How the Karens propitiate such ghosts.] But, whether friends or foes, the ghosts of all who have died a violent death are in a sense a public danger; for their temper is naturally soured and they are apt to fall foul of the first person they meet without nicely discriminating between the innocent and the guilty. The Karens of Burma, for example, think that the spirits of all such persons go neither to the upper regions of bliss nor to the nether world of woe, but linger on earth and wander about invisible. They make men sick to death by stealing their souls. Accordingly these vampire-like beings are exceedingly dreaded by the people, who seek to appease their anger and repel their cruel assaults by propitiatory offerings and the most earnest prayers and supplications.[130.2] They put red, yellow, and white rice in a basket and leave it in the forest, saying: "Ghosts of such as died by falling from a tree, ghosts of such as died of hunger or thirst, ghosts of such as died by the tiger's tooth or the serpent's fang, ghosts of the murdered dead, ghosts of such as died of small-pox or cholera, ghosts of dead lepers, O ill-treat us not, seize not upon our persons, do us no harm. O stay here in this wood. We will bring hither red rice, yellow rice, and white rice for your subsistence."[130.3]

[Sidenote: The angry ghosts of the slain are sometimes forcibly driven away with noise and clamour.] However, it is not always by fair words and propitiatory offerings that the community attempts to rid itself of these invisible but dangerous intruders. People sometimes resort to more forcible measures. "Once," says a traveller among the Indians of North America, "on approaching in the night a village of Ottawas, I found all the inhabitants in confusion: they were all busily engaged in raising noises of the loudest and most inharmonious kind. Upon inquiry, I found that a battle had been lately fought between the Ottawas and the Kickapoos, and that the object of all this noise was to prevent the ghosts of the departed combatants {131} from entering the village."[131.1] Again,

after the North American Indians had burned and tortured a prisoner to death, they used to run through the village, beating the walls, the furniture, and the roofs of the huts with sticks and yelling at the pitch of their voices to drive away the angry ghost of the victim, lest he should seek to avenge the injuries done to his scorched and mutilated body.[131.2] Similarly among the Papuans of Doreh in Dutch New Guinea, when a murder has been committed in the village, the inhabitants assemble for several evenings successively and shriek and shout to frighten away the ghost, in case he should attempt to come back.[131.3] The Yabim, a tribe in German New Guinea, believe that “the dead can both help and harm, but the fear of their harmful influence is predominant. Especially the people are of opinion that the ghost of a slain man haunts his murderer and brings misfortune on him. Hence it is necessary to drive away the ghost with shrieks and the beating of drums. The model of a canoe laden with taro and tobacco is got ready to facilitate his departure.”[131.4] So when the Bukaua of German New Guinea have won a victory over their fo

CONTENTS OF THE SECOND VOLUME.

CHAPTER XII.

ANIMISM (_continued_).

Doctrine of Soul’s Existence after Death; its main divisions, Transmigration and Future Life—Transmigration of Souls: re-birth in Human and Animal Bodies, transference to Plants and Objects—Resurrection of Body: scarcely held in savage religion—Future Life: a general if not universal doctrine of low races—Continued existence, rather than Immortality; second death of Soul—Ghost of Dead remains on earth, especially if corpse unburied; its attachment to bodily remains—Feasts of the Dead 1

CHAPTER XIII.

ANIMISM (_continued_).

Journey of the Soul to the Land of the Dead—Visits by the Living to the Regions of Departed Souls—Connexion of such legends with myths of Sunset: the Land of the Dead thus imagined as in the West—Realization of current religious ideas, whether of savage or civilized theology, in narratives of visits to the Regions of Souls—Localization of the Future Life—Distant earthly region: Earthly Paradise, Isles of the Blest—Subterranean Hades or Sheol—Sun, Moon, Stars—Heaven—Historical course of belief as to such localization—Nature of Future Life—Continuance-theory, apparently original, belongs especially to the lower races—Transitional theories—Retribution-theory, apparently derived, belongs especially to the higher races—Doctrine of Moral Retribution as developed in the higher culture—Survey of Doctrine of Future State, from savage to civilized stages—Its practical effect on the sentiment and conduct of Mankind 44

CHAPTER XIV.

ANIMISM (_continued_).

Animism, expanding from the Doctrine of Souls to the wider Doctrine of Spirits, becomes a complete Philosophy of Natural Religion—Definition of Spirits similar to and apparently modelled on that of Souls—Transition-stage: classes of Souls passing into good and evil Demons—Manes-Worship—Doctrine of Embodiment of Spirits in human, animal, vegetable, and inert bodies—Demoniacal Possession and Obsession as causes of Disease and Oracle-inspiration—Fetishism—Disease-spirits embodied—Ghost attached to remains of Corpse—Fetish produced by a Spirit embodied in, attached to, or operating through, an Object—Analogues of Fetish-doctrine in Modern Science—Stock-and-Stone-Worship—Idolatry—Survival of Animistic Phraseology in modern Language—Decline of Animistic theory of Nature 108

CHAPTER XV.

ANIMISM (_continued_).

Spirits regarded as personal causes of Phenomena of the World—Pervading Spirits as good and evil Demons affecting man—Spirits manifest in Dreams and Visions: Nightmares; Incubi and Succubi; Vampires; Visionary Demons—Demons of darkness repelled by fire—Demons otherwise manifest: seen by animals; detected by footprints—Spirits conceived and treated as material—Guardian and Familiar Spirits—Nature-Spirits; historical course of the doctrine—Spirits of Volcanos, Whirlpools, Rocks—Water-Worship: Spirits of Wells, Streams, Lakes, &c.—Tree-Worship: Spirits embodied in or inhabiting Trees; Spirits of Groves and Forests—Animal-worship: Animals Worshipped, directly, or as incarnations or representatives of Deities; Totemism; Serpent-Worship—Species-Deities; their relation to Archetypal Ideas 184

CHAPTER XVI.

ANIMISM (_continued_).

Higher Deities of Polytheism—Human characteristics applied to Deity—Lords of Spiritual Hierarchy—Polytheism: its course of development in lower and higher Culture—Principles of its investigation; classification of Deities according to central conceptions of their significance and function—Heaven-god—Rain god—Thunder-god—Wind-gods—Earth-god—Water god—Sea-god—Fire-god—Sun-god—Moon-god 247

CHAPTER XVII.

ANIMISM (_continued_).

Polytheism comprises a class of great Deities, ruling the course of Nature and the life of Man—Childbirth-god—Agriculture-god—War-god—God of the Dead—First Man as Divine Ancestor—Dualism; its rudimentary and unethical nature among low races; its development through the course of culture—Good and Evil Deity—Doctrine of Divine Supremacy, distinct from, while tending towards, the doctrine of Monotheism—Idea of a Highest or Supreme Deity evolved in various forms; its place as completion of the Polytheistic system and outcome of the Animistic philosophy; its continuance and development among higher nations—General survey of Animism as a Philosophy of Religion—Recapitulation of the theory advanced as to its development through successive stages of culture; its primary phases best represented among the lower races, while survivals of these among the higher races mark the transition from savage through barbaric to civilized faiths—Transition of

Animism in the History of Religion; its earlier and later stages as a Philosophy of the Universe; its later stages as the principle of a Moral Institution 304

CHAPTER XVIII.

RITES AND CEREMONIES.

Religious Rites: their purpose practical or symbolic—Prayer: its continuity from low to high levels of Culture; its lower phases Unethical; its higher phases Ethical—Sacrifice: its original Gift-theory passes into the Homage-theory and the Abnegation-theory—Manner of reception of Sacrifice by Deity—Material Transfer to elements, fetish-animals, priests; consumption of substance by deity or idol; offering of blood; transmission by fire; incense—Essential transfer: consumption of essence, savour, &c.—Spiritual Transfer: consumption or transmission of soul of offering—Motive of Sacrificer—Transition from Gift-theory to Homage-theory: insignificant and formal offerings; sacrificial banquets—Abnegation-theory; sacrifice of children, &c.—Sacrifice of Substitutes: part given for whole; inferior life for superior; effigies—Modern survival of Sacrifice in folklore and religion—Fasting, as a means of producing ecstatic vision; its course from lower to higher Culture—Drugs use to produce ecstasy—Swoons and fits induced for religious purposes—Orientation: its relation to Sun-myth and Sun-worship; rules of East and West as to burial of dead, position of worship, and structure of temple—Lustration by Water and Fire: its transition from material to symbolic purification; its connexion with special events of life; its appearance among the lower races—Lustration of new-born children; of women; of those polluted by bloodshed or the dead—Lustration continued at higher levels of Culture—Conclusion 362

CHAPTER XIX.

CONCLUSION.

Practical results of the study of Primitive Culture—Its bearing least upon Positive Science, greatest upon Intellectual, Moral, Social, and Political Philosophy—Language—Mythology—Ethics and Law—Religion—Action of the Science of Culture, as a means of furthering progress and removing hindrance, effective in the course of Civilization 443

CHAPTER XII. ANIMISM (_continued_).

Doctrine of Soul’s Existence after Death; its main divisions, Transmigration and Future Life—Transmigration of Souls: re-birth in Human and Animal Bodies, transference to Plants and Objects—Resurrection of Body: scarcely held in savage religion—Future Life: a general if not universal doctrine of low races—Continued existence, rather than Immortality; second death of Soul—Ghost of Dead remains on earth, especially if corpse unburied; its attachment to bodily remains—Feasts of the Dead.

Having thus traced upward from the lower levels of culture the opinions of mankind as to the souls, spirits, ghosts, or phantoms, considered to belong to men, to the lower animals, to plants, and to things, we are now prepared to investigate one of the great religious doctrines of the world, the belief in the soul’s continued existence in a Life after Death. Here let us once more call to mind the consideration which cannot be too strongly put forward, that the doctrine of a Future Life as held by the lower races is the all but necessary outcome of savage Animism. The evidence that the lower races believe the figures of the dead seen in dreams and visions to be their surviving souls, not only goes far to account for the comparative universality of their belief in the continued existence of the soul after the death of the body, but it gives the key to many of their speculations on the nature of this existence, speculations rational enough from the savage point of view, though apt to seem far-fetched absurdities to moderns in their much changed intellectual condition. The belief in a Future Life falls into two main divisions. Closely connected and even largely overlapping one another, both world-wide in their distribution, both ranging back in time to periods of unknown antiquity, both deeply rooted in the lowest strata of human life which lie open to our observation, these two doctrines have in the modern world passed into wonderfully different conditions. The one is the theory of the Transmigration of Souls, which has indeed risen from its lower stages to establish itself among the huge religious communities of Asia, great in history, enormous even in present mass, yet arrested and as it seems henceforth unprogressive in development; but the more highly educated world has rejected the ancient belief, and it now only survives in Europe in dwindling remnants. Far different has been the history of the other doctrine, that of the independent existence of the personal soul after the death of the body, in a Future Life. Passing onward through change after change in the condition of the human race, modified and renewed in its long ethnic course, this great belief may be traced from its crude and primitive manifestations among savage races to its establishment in the heart of modern religion, where the faith in a future existence forms at once an inducement to goodness, a sustaining hope through suffering and across the fear of death, and an answer to the perplexed problem of the allotment of happiness and misery in this present world, by the expectation of another

world to set this right.

In investigating the doctrine of Transmigration, it will be well first to trace its position among the lower races, and afterwards to follow its developments, so far as they extend in the higher civilization. The temporary migration of souls into material substances, from human bodies down to morsels of wood and stone, is a most important part of the lower psychology. But it does not relate to the continued existence of the soul after death, and may be more conveniently treated of elsewhere, in connexion with such subjects as dæmoniacal possession and fetish-worship. We are here concerned with the more permanent tenancy of souls for successive lives in successive bodies.

Permanent transition, new birth, or re-incarnation of human souls in other human bodies, is especially considered to take place by the soul of a deceased person animating the body of an infant. It is recorded by Brebeuf that the Hurons, when little children died, would bury them by the wayside, that their souls might enter into mothers passing by, and so be born again.[1] In North-West America, among the Tacullis, we hear of direct transfusion of soul by the medicine-man, who, putting his hands on the breast of the dying or dead, then holds them over the head of a relative and blows through them; the next child born to this recipient of the departed soul is animated by it, and takes the rank and name of the deceased.[2] The Nutka Indians not without ingenuity accounted for the existence of a distant tribe speaking the same language as themselves, by declaring them to be the spirits of their dead.[3] In Greenland, where the wretched custom of abandoning and even plundering widows and orphans was tending to bring the whole race to extinction, a helpless widow would seek to persuade some father that the soul of a dead child of his had passed into a living child of hers, or _vice versâ_, thus gaining for herself a new relative and protector.[4] It is mostly ancestral or kindred souls that are thought to enter into children, and this kind of transmigration is therefore from the savage point of view a highly philosophical theory, accounting as it does so well for the general resemblance between parents and children, and even for the more special phenomena of atavism. In North-West America, among the Koloshes, the mother sees in a dream the deceased relative whose transmitted soul will give his likeness to the child;[5] and in Vancouver's Island in 1860 a lad was much regarded by the Indians because he had a mark like the scar of a gun-shot wound on his hip, it being believed that a chief dead some four generations before, who had such a mark, had returned.[6] In Old Calabar, if a mother loses a child, and another is born soon after, she thinks the departed one to have come back.[7] The Wanika consider that the soul of a dead ancestor animates a child, and this is why it resembles its father or mother;[8] in Guinea a child bearing a strong resemblance, physical or mental, to a dead relative, is supposed to have inherited his soul;[9] and the Yorubas, greeting a new-born infant with the salutation, 'Thou art come!' look for signs to show what ancestral soul has returned among them.[10] Among the Khonds of Orissa, births are celebrated by a feast on the seventh day, and the priest, divining by dropping rice-grains in a cup of water, and judging from observations made on the person of the infant, determines which of his progenitors has reappeared, and the child generally at least among the northern tribes receives the name of that ancestor.[11] In Europe the Lapps repeat an instructive animistic idea just noticed in America; the future mother was told in a dream what name to give her child, this message being usually given by the very spirit of the deceased ancestor, who was about to be incarnate in her.[12] Among the lower races generally the renewal of old family names by giving them to new-born children may always be suspected of involving some such thought. The following is a curious pair of instances from the two halves of the globe. The New Zealand priest would repeat to the infant a long list of names of its ancestors, fixing upon that name which the child by sneezing or crying when it was uttered, was considered to select for itself; while the Cheremiss in Russia would shake the baby till it cried, and then repeat names to it, till it chose itself one by leaving off crying.[13]

The belief in the new human birth of the departed soul, which has even led West African negroes to commit suicide when in distant slavery, that they may revive in their own land, in fact amounts among several of the lower races to a distinct doctrine of an earthly resurrection. One of the most remarkable forms which this belief assumes is when dark-skinned races, wanting some reasonable theory to account for the appearance among them of human creatures of a new strange sort, the white men, and struck with their pallid deathly hue combined with powers that seem those of superhuman spiritual beings, have determined that the manes of their dead must have come back in this wondrous shape. The aborigines of Australia have expressed this theory in the simple formula, 'Blackfellow tumble down, jump up Whitefellow.' Thus a native who was hanged years ago at Melbourne expressed in his last moments the hopeful belief that he would jump up Whitefellow, and have lots of sixpences. The doctrine has been current among them since early days of European intercourse, and in accordance with it they habitually regarded the Englishmen as their own deceased kindred, come back to their country from an attachment to it in a former life. Real or imagined likeness completed the delusion, as when Sir George Grey was hugged and wept over by an old woman who found in him a son she had lost, or when a convict, recognized as a deceased relative, was endowed anew with the land he had possessed during his former life. A similar theory may be traced northward by the Torres Islands to New Caledonia, where the natives thought the white men to be the spirits of the dead who bring sickness, and assigned this as their reason for wishing to kill white men.[14] In Africa, again, the belief is

found among the Western negroes that they will rise again white, and the Bari of the White Nile, believing in the resurrection of the dead on earth, considered the first white people they saw as departed spirits thus come back.[15]

Next, the lower psychology, drawing no definite line of demarcation between souls of men and of beasts, can at least admit without difficulty the transmission of human souls into the bodies of the lower animals. A series of examples from among the native tribes of America will serve well to show the various ways in which such ideas are worked out. The Ahts of Vancouver's Island consider the living man's soul able to enter into other bodies of men and animals, going in and out like the inhabitant of a house. In old times, they say, men existed in the forms of birds, beasts, and fishes, or these had the spirits of the Indians in their bodies; some think that after death they will pass again into the bodies of the animals they occupied in this former state.[16] In an Indian district of North-West California, we find natives believing the spirits of their dead to enter into bears, and travellers have heard of a tribe begging the life of a wrinkle-faced old she grizzly bear as the recipient of the soul of some particular grandam, whom they fancied the creature to resemble.[17] So, among the Esquimaux, a traveller noticed a widow who was living for conscience' sake upon birds, and would not touch walrus-meat, which the angekok had forbidden her for a time, because her late husband had entered into a walrus.[18] Among other North American tribes, we hear of the Powhatans refraining from doing harm to certain small wood-birds which received the souls of their chiefs;[19] of Huron souls turning into turtle-doves after the burial of their bones at the Feast of the Dead;[20] of that pathetic funeral rite of the Iroquois, the setting free a bird on the evening of burial, to carry away the soul.[21] In Mexico, the Tlascalans thought that after death the souls of nobles would animate beautiful singing birds, while plebeians passed into weasels and beetles and such like vile creatures.[22] So, in Brazil, the Içannas say that the souls of the brave will become beautiful birds, feeding on pleasant fruits, but cowards will be turned into reptiles.[23] Among the Abipones we hear of certain little ducks which fly in flocks at night, uttering a mournful hiss, and which fancy associates with the souls of the dead;[24] while in Popayan it is said that doves were not killed, as inspired by departed souls.[25] Lastly, transmigration into brutes is also a received doctrine in South America as when a missionary heard a Chiriquane woman of western Brazil say of a fox, 'May not that be the spirit of my dead daughter?'[26]

In Africa, again, mention is made of the Maravi thinking that the souls of bad men became jackals, and of good men snakes.[27] The Zulus, while admitting that a man may turn into a wasp or lizard, work out in the fullest way the idea of the dead becoming snakes, a creature whose change of skin has so often been associated with the thought of resurrection and immortality. It is especially certain green or brown harmless snakes, which come gently and fearlessly into houses, which are considered to be 'amatongo' or ancestors, and therefore are treated respectfully, and have offerings of food given them. In two ways, the dead man who has become a snake can still be recognized; if the creature is one-eyed, or has a scar or some other mark, it is recognized as the 'itongo' of a man who was thus marked in life; but if he had no mark the 'itongo' appears in human shape in dreams, thus revealing the personality of the snake.[28] In Guinea, monkeys found near a graveyard are supposed to be animated by the spirits of the dead, and in certain localities monkeys, crocodiles, and snakes, being thought men in metempsychosis, are held sacred.[29] It is to be borne in mind that notions of this kind may form in barbaric psychology but a portion of the wide doctrine of the soul's future existence. For a conspicuous instance of this, let us take the system of the Gold-Coast negroes. They believe that the 'kla' or 'kra,' the vital soul, becomes at death a 'sisa' or ghost, which can remain in the house with the body, plague the living, and cause sickness, till it departs or is driven by the sorcerer to the bank of the River Volta, where the ghosts build themselves houses and dwell. But they can and do come back from this Land of Souls. They can be born again as souls in new human bodies, and a soul who was poor before will now be rich. Many will not come back as men, but will become animals. To an African mother who has lost her child, it is a consolation to say, 'He will come again.'[30]

In higher levels of culture, the theory of re-embodiment of the soul appears in strong and varied development. Though seemingly not received by the early Aryans, the doctrine of migration was adopted and adapted by Hindu philosophy, and forms an integral part of that great system common to Brahmanism and Buddhism, wherein successive births or existences are believed to carry on the consequences of past and prepare the antecedents of future life. To the Hindu the body is but the temporary receptacle of the soul, which, 'bound in the chains of deeds' and 'eating the fruits of past actions,' promotes or degrades itself along a series of embodiments in plant, beast, man, deity. Thus all creatures differ rather in degree than kind, all are akin to man, an elephant or ape or worm may once have been human, and may become human again, a pariah or barbarian is at once low-caste among men and high-caste among brutes. Through such bodies migrate the sinful souls which desire has drawn down from primal purity into gross material being; the world where they do penance for the guilt incurred in past existences is a huge reformatory, and life is the long grievous process of developing evil into good. The rules are set forth in the book of Manu how souls endowed with the quality of goodness acquire divine nature, while souls governed by passion take up the human state, and souls sunk in darkness are degraded to brutes. Thus the range of migration stretches downward from gods and saints, through holy ascetics, Brahmans,

nymphs, kings, counsellors, to actors, drunkards, birds, dancers, cheats, elephants, horses, Sudras, barbarians, wild beasts, snakes, worms, insects, and inert things. Obscure as the relation mostly is between the crime and its punishment in a new life, there may be discerned through the code of penal transmigration an attempt at appropriateness of penalty, and an intention to punish the sinner wherein he sinned. For faults committed in a previous existence men are afflicted with deformities, the stealer of food shall be dyspeptic, the scandal-monger shall have foul breath, the horse-stealer shall go lame, and in consequence of their deeds men shall be born idiots, blind, deaf and dumb, mis-shaped, and thus despised of good men. After expiation of their wickedness in the hells of torment, the murderer of a Brahman may pass into a wild beast or pariah; he who adulterously dishonours his guru or spiritual father shall be a hundred times re-born as grass, a bush, a creeper, a carrion bird, a beast of prey; the cruel shall become blood-thirsty beasts; stealers of grain and meat shall turn into rats and vultures; the thief who took dyed garments, kitchen-herbs, or perfumes, shall become accordingly a red partridge, a peacock, or a musk-rat. In short, 'in whatever disposition of mind a man accomplishes such and such an act, he shall reap the fruit in a body endowed with such and such a quality.'[31] The recognition of plants as possible receptacles of the transmigrating spirit well illustrates the conception of souls of plants. The idea is one known to lower races in a district of the world which has been under Hindu influence. Thus we hear among the Dayaks of Borneo of the human soul entering the trunks of trees, where it may be seen damp and blood-like, but no longer personal and sentient, or of its being re-born from an animal which has eaten of the bark, flower, or fruit;[32] and the Santals of Bengal are said to fancy that uncharitable men and childless women are eaten eternally by worms and snakes, while the good enter into fruit-bearing trees.[33] But it is an open question how far these and the Hindu ideas of vegetable transmigration can be considered as independent. A curious commentary on the Hindu working out of the conception of plant-souls is to be found in a passage in a 17th-century work, which describes certain Brahmans of the Coromandel Coast as eating fruits, but being careful not to pull the plants up by the roots, lest they should dislodge a soul; but few, it is remarked, are so scrupulous as this, and the consideration has occurred to them that souls in roots and herbs are most vile and abject bodies, so that if dislodged they may become better off by entering into the bodies of men or beasts.[34] Moreover, the Brahmanic doctrine of souls transmigrating into inert things has in like manner a bearing on the savage theory of object-souls.[35]

Buddhism, like the Brahmanism from which it seceded, habitually recognized transmigration between superhuman and human beings and the lower animals, and in an exceptional way recognized a degradation even into a plant or a thing. How the Buddhist mind elaborated the doctrine of metempsychosis, may be seen in the endless legends of Gautama himself undergoing his 550 births, suffering pain and misery through countless ages to gain the power of freeing sentient beings from the misery inherent in all existence. Four times he became Maha Brahma, twenty times the dewa Sekra, and many times or few he passed through such stages as a hermit, a king, a rich man, a slave, a potter, a gambler, a curer of snake bites, an ape, an elephant, a bull, a serpent, a snipe, a fish, a frog, the dewa or genius of a tree. At last, when he became the supreme Buddha, his mind, like a vessel overflowing with honey, overflowed with the ambrosia of truth, and he proclaimed his triumph over life:—

'Painful are repeated births. O house-builder! I have seen thee, Thou canst not build again a house for me. Thy rafters are broken Thy roof-timbers are shattered. My mind is detached, I have attained to the extinction of desire.'

Whether the Buddhists receive the full Hindu doctrine of the migration of the individual soul from birth to birth, or whether they refine away into metaphysical subtleties the notion of continued personality, they do consistently and systematically hold that a man's life in former existences is the cause of his now being what he is, while at this moment he is accumulating merit or demerit whose result will determine his fate in future lives. Memory, it is true, fails generally to recall these past births, but memory, as we know, stops short of the beginning even of this present life. When King Bimsara's feet were burned and rubbed with salt by command of his cruel son that he might not walk, why was this torture inflicted on a man so holy? Because in a previous birth he had walked near a dagoba with his slippers on, and had trodden on a priest's carpet without washing his feet. A man may be prosperous for a time on account of the merit he has received in former births, but if he does not continue to keep the precepts, his next birth will be in one of the hells, he will then be born in this world as a beast, afterwards as a preta or sprite; a proud man may be born again ugly with large lips, or as a demon or a worm. The Buddhist theory of 'karma' or 'action,' which controls the destiny of all sentient beings, not by judicial reward and punishment, but by the inflexible result of cause into effect, wherein the present is ever determined by the past in an unbroken line of causation, is indeed one of the world's most remarkable developments of ethical speculation.[36]

Within the classic world, the ancient Egyptians were described as maintaining a doctrine of migration, whether by successive embodiments of the immortal soul through creatures of earth, sea, and air, and back again to man, or by the simpler judicial penalty which sent back the wicked dead to earth as unclean beasts.[37] The pictures and hieroglyphic sentences of the Book of the Dead, however, do not afford the necessary confirmation for these statements, even the mystic transformations of the soul not being of

the nature of transmigrations. Thus it seems that the theological centre whence the doctrine of moral metempsychosis may have spread over the ancient cultured religions, must be sought elsewhere than in Egypt. In Greek philosophy, great teachers stood forth to proclaim the doctrine in a highly developed form. Plato had mythic knowledge to convey of souls entering such new incarnations as their glimpse of real existence had made them fit for, from the body of a philosopher or a lover down to the body of a tyrant and usurper; of souls transmigrating into beasts and rising again to man according to the lives they led; of birds that were light-minded souls; of oysters suffering in banishment the penalty of utter ignorance. Pythagoras is made to illustrate in his own person his doctrine of metempsychosis, by recognizing where it hung in Here's temple the shield he had carried in a former birth, when he was that Euphorbos whom Menelaos slew at the siege of Troy. Afterwards he was Hermotimos, the Klazomenian prophet whose funeral rites were so prematurely celebrated while his soul was out, and after that, as Lucian tells the story, his prophetic soul passed into the body of a cock. Mikyllos asks this cock to tell him about Troy—were things there really as Homer said? But the cock replies, 'How should Homer have known, O Mikyllos? When the Trojan war was going on, he was a camel in Baktria!'[38]

In the later Jewish philosophy, the Kabbalists took up the doctrine of migration, the _gilgul_ or 'rolling on' of souls, and maintained it by that characteristic method of Biblical interpretation which it is good to hold up from time to time for a warning to the mystical interpreters of our own day. The soul of Adam passed into David, and shall pass into the Messiah, for are not these initials in the very name of Ad(a)m, and does not Ezekiel say that 'my servant David shall be their prince for ever.' Cain's soul passed into Jethro, and Abel's into Moses, and therefore it was that Jethro gave Moses his daughter to wife. Souls migrate into beasts and birds and vermin, for is not Jehovah 'the lord of the spirits of all flesh'? and he who has done one sin beyond his good works shall pass into a brute. He who gives a Jew unclean meat to eat, his soul shall enter into a leaf, blown to and fro by the wind; 'for ye shall be as an oak whose leaf fadeth;' and he who speaks ill words, his soul shall pass into a dumb stone, as did Nabal's, 'and he became a stone.'[39] Within the range of Christian influence the Manichæans appear as the most remarkable exponents of the metempsychosis. We hear of their ideas of sinners' souls transmigrating into beasts, the viler according to their crimes; that he who kills a fowl or rat will become a fowl or rat himself; that souls can pass into plants rooted in the ground, which thus have not only life but sense; that the souls of reapers pass into beans and barley, to be cut down in their turn, and thus the elect were careful to explain to the bread when they ate it, that it was not they who reaped the corn it was made of; that the souls of the auditors, that is, the spiritually low commonalty who lived a married life, would pass into melons and cucumbers, to finish their purification by being eaten by the elect. But these details come to us from the accounts of bitter theological adversaries, and the question is, how much of them did the Manichæans really and soberly believe? Allowing for exaggeration and constructive imputation, there is some reason to consider the account at least founded on fact. The Manichæans appear to have recognized a wandering of imperfect souls, whether or not their composite religion may with its Zarathustrian and Christian elements have also absorbed in so Indian a shape the doctrine of purification of souls by migration into animals and plants.[40] In later times, the doctrine of metempsychosis has been again and again noticed in a district of South-Western Asia. William of Ruysbroek speaks of the notion of souls passing from body to body as general among the mediæval Nestorians, even a somewhat intelligent priest consulting him as to the souls of brutes, whether they could find refuge elsewhere so as not to be compelled to labour after death. Rabbi Benjamin of Tudela records in the 12th century of the Druses of Mount Hermon: 'They say that the soul of a virtuous man is transferred to the body of a new-born child, whereas that of the vicious transmigrates into a dog, or some other animal.' Such ideas indeed, seem not yet extinct in the modern Druse nation. Among the Nassairi, also, transmigration is believed in as a penance and purification: we hear of migration of unbelievers into camels, asses, dogs, or sheep, of disobedient Nassairi into Jews, Sunnis, or Christians, of the faithful into new bodies of their own people, a few such changes of 'shirt' (i.e. body), bringing them to enter paradise or become stars.[41] An instance of the belief within the limits of modern Christian Europe may be found among the Bulgarians, whose superstition is that Turks who have never eaten pork in life will become wild boars after death. A party assembled to feast on a boar has been known to throw it all away, for the meat jumped off the spit into the fire, and a piece of cotton was found in the ears, which the wise man decided to be a piece of the ci-devant Turk's turban.[42] Such cases, however, are exceptional. Metempsychosis never became one of the great doctrines of Christendom, though not unknown in mediæval scholasticism, and though maintained by an eccentric theologian here and there into our own times. It would be strange were it not so. It is in the very nature of the development of religion that speculations of the earlier culture should dwindle to survivals, yet be again and again revived. Doctrines transmigrate, if souls do not; and metempsychosis, wandering along the course of ages, came at last to animate the souls of Fourier and Soame Jenyns.[43]

Thus we have traced the theory of metempsychosis in stage after stage of the world's civilization, scattered among the native races of America and Africa, established in the Asiatic nations, especially where elaborated by the Hindu mind into its system of ethical philosophy, rising and falling in classic and mediæval Europe, and lingering at last in the modern world as an intellectual crotchet,

of little account but to the ethnographer who notes it down as an item of evidence for his continuity of culture. What, we may well ask, was the original cause and motive of the doctrine of transmigration? Something may be said in answer, though not at all enough for full explanation. The theory that ancestral souls return, thus imparting their own likeness of mind and body to their descendants and kindred, has been already mentioned and commended as in itself a very reasonable and philosophical hypothesis, accounting for the phenomenon of family likeness going on from generation to generation. But why should it have been imagined that men's souls could inhabit the bodies of beasts and birds? As has been already pointed out, savages not unreasonably consider the lower animals to have souls like their own, and this state of mind makes the idea of a man's soul transmigrating into a beast's body at least seem possible. But it does not actually suggest the idea. The view stated in a previous chapter as to the origin of the conception of soul in general, may perhaps help us here. As it seems that the first conception of souls may have been that of the souls of men, this being afterwards extended by analogy to the souls of animals, plants, &c., so it may seem that the original idea of transmigration was the straightforward and reasonable one of human souls being re-born in new human bodies, where they are recognized by family likenesses in successive generations. This notion may have been afterwards extended to take in re-birth in bodies of animals, &c. There are some well-marked savage ideas which will fit with such a course of thought. The half-human features and actions and characters of animals are watched with wondering sympathy by the savage, as by the child. The beast is the very incarnation of familiar qualities of man; and such names as lion, bear, fox, owl, parrot, viper, worm, when we apply them as epithets to men, condense into a word some leading feature of a human life. Consistently with this, we see in looking over details of savage transmigration that the creatures often have an evident fitness to the character of the human beings whose souls are to pass into them, so that the savage philosopher's fancy of transferred souls offered something like an explanation of the likeness between beast and man. This comes more clearly into view among the more civilized races who have worked out the idea of transmigration into ethical schemes of retribution, where the appropriateness of the creatures chosen is almost as manifest to the modern critic as it could have been to the ancient believer. Perhaps the most graphic restoration of the state of mind in which the theological doctrine of metempsychosis was worked out in long-past ages, may be found in the writings of a modern theologian whose spiritualism often follows to the extreme the intellectual tracks of the lower races. In the spiritual world, says Emanuel Swedenborg, such persons as have opened themselves for the admission of the devil and acquired the nature of beasts, becoming foxes in cunning, &c., appear also at a distance in the proper shape of such beasts as they represent in disposition.[44] Lastly, one of the most notable points about the theory of transmigration is its close bearing upon a thought which lies very deep in the history of philosophy, the development-theory of organic life in successive stages. An elevation from the vegetable to the lower animal life, and thence onward through the higher animals to man, to say nothing of superhuman beings, does not here require even a succession of distinct individuals, but is brought by the theory of metempsychosis within the compass of the successive vegetable and animal lives of a single being.

Here a few words may be said on a subject which cannot be left out of sight, connecting as it does the two great branches of the doctrine of future existence, but which it is difficult to handle in definite terms, and much more to trace historically by comparing the views of lower and higher races. This is the doctrine of a bodily renewal or resurrection. To the philosophy of the lower races it is by no means necessary that the surviving soul should be provided with a new body, for it seems itself to be of a filmy or vaporous corporeal nature, capable of carrying on an independent existence like other corporeal creatures. Savage descriptions of the next world are often such absolute copies of this, that it is scarcely possible to say whether the dead are or are not thought of as having bodies like the living; and a few pieces of evidence of this class are hardly enough to prove the lower races to hold original and distinct doctrines of corporeal resurrection.[45] Again, attention must be given to the practice, so common among low and high races, of preserving relics of the dead, from mere morsels of bone up to whole mummified bodies. It is well known that the departed soul is often thought apt to revisit the remains of the body, as is seen in the well-known pictures of the Egyptian funeral ritual. But the preservation of these remains, even where it thus involves a permanent connexion between body and soul, does not necessarily approach more closely to a bodily resurrection.[46] In discussing the closely allied doctrine of metempsychosis, I have described the theory of the soul's transmigration into a new human body as asserting in fact an earthly resurrection. From the same point of view, a bodily resurrection in Heaven or Hades is technically a transmigration of the soul. This is plain among the higher races, in whose religion these doctrines take at once clearer definition and more practical import. There are some distinct mentions of bodily resurrection in the Rig Veda: the dead is spoken of as glorified, putting on his body (tanu); and it is even promised that the pious man shall be born in the next world with his entire body (sarvatanû). In Brahminism and Buddhism, the re-births of souls in bodies to inhabit heavens and hells are simply included as particular cases of transmigration. The doctrine of the resurrection appears far back in the religion of Persia, and is thence supposed to have passed into late Jewish belief.[47] In early Christianity, the conception of bodily resurrection is developed with especial strength and fulness in the Pauline doctrine. For an explicit interpretation of this doctrine, such as commended itself to the minds of later theologians, it is instructive to cite the remarkable

passage of Origen, where he speaks of ‘corporeal matter, of which matter, in whatever quality placed, the soul always has use, now indeed carnal, but afterwards indeed subtler and purer, which is called spiritual.’[48]

Passing from these metaphysical doctrines of civilized theology, we now take up a series of beliefs higher in practical moment, and more clearly conceived in savage thought. There may well have been, and there may still be, low races destitute of any belief in a Future State. Nevertheless, prudent ethnographers must often doubt accounts of such, for this reason, that the savage who declares that the dead live no more, may merely mean to say that they are dead. When the East African is asked what becomes of his buried ancestors, the ‘old people,’ he can reply that ‘they are ended,’ yet at the same time he fully admits that their ghosts survive.[49] In an account of the religious ideas of the Zulus, taken down from a native, it is explicitly stated that Unkulunkulu the Old-Old-One said that people ‘were to die and never rise again,’ and that he allowed them to ‘die and rise no more.’[50] Knowing so thoroughly as we now do the theology of the Zulus, whose ghosts not only survive in the under-world, but are the very deities of the living, we can put the proper sense to these expressions. But without such information, we might have mistaken them for denials of the soul’s existence after death. This objection may even apply to one of the most formal denials of a future life ever placed on record among an uncultured race, a poem of the Dinka tribe of the White Nile, concerning Dendid the Creator:—

‘On the day when Dendid made all things, He made the sun; And the sun comes forth, goes down, and comes again: He made the moon; And the moon comes forth, goes down, and comes again: He made the stars; And the stars come forth, go down, and come again: He made man; And man comes forth, goes down into the ground, and comes no more.’

It is to be remarked, however, that the close neighbours of these Dinka, the Bari, believe that the dead do return to live again on earth, and the question arises whether it is the doctrine of bodily resurrection, or the doctrine of the surviving ghost-soul, that the Dinka poem denies. The missionary Kaufmann says that the Dinka do not believe the immortality of the soul, that they think it but a breath, and with death all is over; Brun-Rollet’s contrary authority goes to prove that they do believe in another life; both leave it an open question whether they recognize the existence of surviving ghosts.[51]

Looking at the religion of the lower races as a whole, we shall at least not be ill-advised in taking as one of its general and principal elements the doctrine of the soul’s Future Life. But here it is needful to explain, to limit, and to reserve, lest modern theological ideas should lead us to misconstrue more primitive beliefs. In such enquiries the phrase ‘immortality of the soul’ is to be avoided as misleading. It is doubtful how far the lower psychology entertains at all an absolute conception of immortality, for past and future fade soon into utter vagueness as the savage mind quits the present to explore them, the measure of months and years breaks down even within the narrow span of human life, and the survivor’s thought of the soul of the departed dwindles and disappears with the personal memory that kept it alive. The doctrine of the surviving soul may indeed be treated as common to all known races, though its acceptance is not unanimous. In savage as in civilized life, dull and careless natures ignore a world to come as too far off, while sceptical intellects are apt to reject its belief as wanting proof. There are even statements on record of whole classes being formally excluded from future life. This may be a matter of social pride. In the Tonga Islands, according to Mariner, it was held that the chiefs and nobles would live hereafter in the happy island of Bolotu, but that the souls of the common people would die with their bodies. So Captain John Smith relates as to the belief of the Virginians, that the chiefs went after death beyond the sunset mountains, there to dance and sing with their predecessors, ‘but the common people they suppose shall not live after death.’ In the record of a missionary examination of the Nicaraguans, they are made to state their belief that if a man lived well, his soul would ascend to dwell among the gods, but if ill it would perish with the body, and there would be an end of it.[52] None of these accounts, however, agree with what is known of the religion of kindred peoples, Polynesian, Algonquin, or Aztec. But granted that the soul survives the death of the body, instance after instance from the records of the lower culture shows this soul to be regarded as a mortal being, liable like the body itself to accident and death. The Greenlanders pitied the poor souls who must pass in winter or in storm the dreadful mountain where the dead descend to reach the other world, for then a soul is like to come to harm, and die the other death where there is nothing left, and this is to them the dolefullest thing of all.[53] Thus the Fijians tell of the fight which the ghost of a departed warrior must wage with the soul-killing Samu and his brethren; this is the contest for which the dead man is armed by burying the war-club with his corpse, and if he conquers, the way is open for him to the judgment-seat of Ndengei, but if he is wounded, his doom is to wander among the mountains, and if killed in the encounter he is cooked and eaten by Samu and his brethren. But the souls of unmarried Fijians will not even survive to stand this wager of battle; such try in vain to steal at low water round to the edge of the reef past the rocks where Nangananga, destroyer of wifeless souls, sits laughing at their hopeless efforts, and asking them if they think the tide will never flow again, till at last the rising flood drives the shivering ghosts to the beach, and Nangananga dashes them in pieces on the great black stone, as one shatters rotten firewood.[54] Such, again, were the tales told by the Guinea negroes of the life or death of departed souls. Either the great priest before whom they must appear after death

would judge them, sending the good in peace to a happy place, but killing the wicked a second time with the club that stands ready before his dwelling; or else the departed shall be judged by their god at the river of death, to be gently wafted by him to a pleasant land if they have kept feasts and oaths and abstained from forbidden meats, but if not, to be plunged into the river by the god, and thus drowned and buried in eternal oblivion.[55] Even common water can drown a negro ghost, if we may believe the missionary Cavazzi's story of the Matamba widows being ducked in the river or pond to drown off the souls of their departed husbands, who might still be hanging about them, clinging closest to the best-loved wives. After this ceremony, they went and married again.[56] From such details it appears that the conception of some souls suffering extinction at death or dying a second death, a thought still as heretofore familiar to speculative theology, is not unknown in the lower culture.

The soul, as recognized in the philosophy of the lower races, may be defined as an ethereal surviving being, conceptions of which preceded and led up to the more transcendental theory of the immaterial and immortal soul, which forms part of the theology of higher nations. It is principally the ethereal surviving soul of early culture that has now to be studied in the religions of savages and barbarians and the folk-lore of the civilized world. That this soul should be looked on as surviving beyond death is a matter scarcely needing elaborate argument. Plain experience is there to teach it to every savage; his friend or his enemy is dead, yet still in dream or open vision he sees the spectral form which is to his philosophy a real objective being, carrying personality as it carries likeness. This thought of the soul's continued existence is, however, but the gateway into a complex region of belief. The doctrines which, separate or compounded, make up the scheme of future existence among particular tribes, are principally these: the theories of lingering, wandering, and returning ghosts, and of souls dwelling on or below or above the earth in a spirit-world, where existence is modelled upon the earthly life, or raised to higher glory, or placed under reversed conditions, and lastly, the belief in a division between happiness and misery of departed souls, by a retribution for deeds done in life, determined in a judgment after death.

'All argument is against it; but all belief is for it,' said Dr. Johnson of the apparition of departed spirits. The doctrine that ghost-souls of the dead hover among the living is indeed rooted in the lowest levels of savage culture, extends through barbaric life almost without a break, and survives largely and deeply in the midst of civilization. From the myriad details of travellers, missionaries, historians, theologians, spiritualists, it may be laid down as an admitted opinion, as wide in distribution as it is natural in thought, that the two chief hunting-grounds of the departed soul are the scenes of its fleshly life and the burial place of its body. As in North America the Chickasaws believed that the spirits of the dead in their bodily shape moved about among the living in great joy; as the Aleutian islanders fancied the souls of the departed walking unseen among their kindred, and accompanying them in their journeys by sea and land; as Africans think that souls of the dead dwell in their midst, and eat with them at meal times; as Chinese pay their respects to kindred spirits present in the hall of ancestors;[57] so multitudes in Europe and America live in an atmosphere that swarms with ghostly shapes—spirits of the dead, who sit over against the mystic by his midnight fire, rap and write in spirit-circles, and peep over girls' shoulders as they scare themselves into hysterics with ghost-stories. Almost throughout the vast range of animistic religion, we shall find the souls of the departed hospitably entertained by the survivors on set occasions, and manes-worship, so deep and strong among the faiths of the world, recognizes with a reverence not without fear and trembling those ancestral spirits which, powerful for good or ill, manifest their presence among mankind. Nevertheless death and life dwell but ill together, and from savagery onward there is recorded many a device by which the survivors have sought to rid themselves of household ghosts. Though the unhappy savage custom of deserting houses after a decease may often be connected with other causes, such as horror or abnegation of all things belonging to the dead, there are cases where it appears that the place is simply abandoned to the ghost. In Old Calabar it was customary for the son to leave his fathers' house to decay, but after two years he might rebuild it, the ghost being thought by that time to have departed;[58] the Hottentots abandoned the dead man's house, and were said to avoid entering it lest the ghost should be within;[59] the Yakuts let the hut fall in ruins where any one had expired, thinking it the habitation of demons;[60] the Karens were said to destroy their villages to escape the dangerous neighbourhood of departed souls.[61] Such proceedings, however, scarcely extend beyond the limits of barbarism, and only a feeble survival of the old thought lingers on into civilization, where from time to time a haunted house is left to fall in ruins, abandoned to a ghostly tenant who cannot keep it in repair. But even in the lowest culture we find flesh holding its own against spirit, and at higher stages the householder rids himself with little scruple of an unwelcome inmate. The Greenlanders would carry the dead out by the window, not by the door, while an old woman, waving a firebrand behind, cried 'piklerrukpok!' i.e., 'there is nothing more to be had here!';[62] the Hottentots removed the dead from the hut by an opening broken out on purpose, to prevent him from finding the way back;[63] the Siamese, with the same intention, break an opening through the house wall to carry the coffin through, and then hurry it at full speed thrice round the house;[64] in Russia the Chuwashes fling a red-hot stone after the corpse is carried out, for an obstacle to bar the soul from coming back;[65] so Brandenburg peasants pour out a pail of water at the door after the coffin, to prevent the ghost from walking; and Pomeranian mourners returning from the churchyard leave behind the straw from the hearse that the

wandering soul may rest there, and not come back so far as home.[66] In the ancient and mediæval world, men habitually invoked supernatural aid beyond such material shifts as these, calling in the priest to lay or banish intruding ghosts, nor is this branch of the exorcist's art even yet forgotten. There is, and always has been, a prevalent feeling that disembodied souls, especially such as have suffered a violent or untimely death, are baneful and malicious beings. As Meiners suggests in his 'History of Religions,' they were driven unwillingly from their bodies, and have carried into their new existence an angry longing for revenge. No wonder that mankind should so generally agree that if the souls of the dead must linger in the world at all, their fitting abode should be not the haunts of the living but the resting-places of the dead.

After all, it scarcely seems to the lower animistic philosophy that the connexion between body and soul is utterly broken by death. Various wants may keep the soul from its desired rest, and among the chief of these is when its mortal remains have not had the funeral rites. Hence the deep-lying belief that the ghosts of such will walk. Among some Australian tribes the 'ingna,' or evil spirits, human in shape, but with long tails and long upright ears, are mostly souls of departed natives, whose bodies were left to lie unburied or whose death the avenger of blood did not expiate, and thus they have to prowl on the face of the earth, and about the place of death, with no gratification but to harm the living.[67] In New Zealand, the ideas were to be found that the souls of the dead were apt to linger near the bodies, and that the spirits of men left unburied or killed in battle and eaten, would wander; and the bringing such malignant souls to dwell within the sacred burial-enclosure was a task for the priest to accomplish with his charms.[68] Among the Iroquois of North America the spirit also stays near the body for a time, and 'unless the rites of burial were performed, it was believed that the spirits of the dead hovered for a time upon the earth, in a state of great unhappiness. Hence their extreme solicitude to procure the bodies of the slain in battle.'[69] Among Brazilian tribes, the wandering shadows of the dead are said to be considered unresting till burial.[70] In Turanian regions of North Asia, the spirits of the dead who have no resting-place in earth are thought of as lingering above ground, especially where their dust remains.[71] South Asia has such beliefs: the Karens say that the ghosts who wander on earth are not the spirits of those who go to Plu, the land of the dead, but of infants, of such as died by violence, of the wicked, and of those who by accident have not been buried or burned;[72] the Siamese fear as unkindly spirits the souls of such as died a violent death or were not buried with the proper rites, and who desiring expiation, invisibly terrify their descendants.[73] Nowhere in the world had such thoughts a stronger hold than in classic antiquity, where it was the most sacred of duties to give the body its funeral rites, that the shade should not flit moaning near the gates of Hades, nor wander in the dismal crowd along the banks of Acheron.[74] An Australian or a Karen would have taken in the full significance of the fatal accusation against the Athenian commanders, that they abandoned the bodies of their dead in the sea-fight of Arginousai. The thought is not unknown to Slavonic folk-lore: 'Ha! with the shriek the spirit flutters from the mouth, flies up to the tree, from tree to tree, hither and thither till the dead is burned.'[75] In mediæval Europe the classic stories of ghosts that haunt the living till laid by rites of burial pass here and there into new legends, where, under a changed dispensation, the doleful wanderer now asks Christian burial in consecrated earth.[76] It is needless to give here elaborate details of the world-wide thought that when the corpse is buried, exposed, burned, or otherwise disposed of after the accepted custom of the land, the ghost accompanies its relics. The soul stays near the Polynesian or the American Indian burial-place; it dwells among the twigs and listens joyfully to the singing birds in the trees where Siberian tribes suspend their dead; it lingers by the Samoyed's scaffolded coffin; it haunts the Dayak's place of burial or burning; it inhabits the little soul-hut above the Malagasy grave, or the Peruvian house of sun-dried bricks; it is deposited in the Roman tomb (animamque sepulchro condimus); it comes back for judgment into the body of the later Israelite and the Moslem; it inhabits, as a divine ancestral spirit, the palace-tombs of the old classic and new Asiatic world; it is kept down by the huge cairn raised over Antar's body lest his mighty spirit should burst forth, by the iron nails with which the Cheremiss secures the corpse in its coffin, by the stake that pins down the suicide's body at the four-cross way. And through all the changes of religious thought from first to last in the course of human history, the hovering ghosts of the dead make the midnight burial-ground a place where men's flesh creeps with terror. Not to discuss here the general subject of funeral rites of mankind, of which only part of the multifarious details are directly relevant to the present purpose, a custom may be selected which is admirably adapted for the study of animistic religion, at once from the clear conception it gives of the belief in disembodied souls present among the living, and from the distinct line of ethnographic continuity in which it may be traced onward from the lower to the higher culture. This is the custom of Feasts of the Dead.

Among the funeral offerings described in the last chapter of which the purpose more or less distinctly appears to be that the departed soul shall take them away in some ghostly or ideal manner, or that they shall by some means be conveyed to him in his distant spirit-home, there are given supplies of food and drink. But the feasts of the dead with which we are now concerned are given on a different principle; they are, so to speak, to be consumed on the premises. They are set out in some proper place, especially near the tombs or in the dwelling-houses, and there the souls of the dead come and satisfy themselves. In North

America, among Algonquins who held that one of a man's two souls abides with the body after death, the provisions brought to the grave were intended for the nourishment of this soul; tribes would make offerings to ancestors of part of any dainty food, and an Indian who fell by accident into the fire would believe that the spirits of his ancestors pushed him in for neglecting to make due offerings.[77] The minds of the Hurons were filled with fancies not less lifelike than this. It seemed to them that the dead man's soul, in his proper human figure, walked in front of the corpse as they carried it to the burial-ground, there to dwell till the great feast of the dead; but meanwhile it would come and walk by night in the village, and eat the remnants in the kettles, wherefore some would not eat of these, nor touch the food at funeral feasts—though some indeed would eat all.[78] In Madagascar, the elegant little upper chamber in King Radama's mausoleum was furnished with a table and two chairs, and a bottle of wine, a bottle of water, and two tumblers were placed there conformably with the ideas entertained by most of the natives, that the ghost of the departed monarch might occasionally visit the resting-place of his body, meet with the spirit of his father, and partake of what he was known to be fond of in his lifetime.[79] The Wanika of East Africa set a coco-nut shell full of rice and tembo near the grave for the 'koma' or shade, which cannot exist without food and drink.[80] In West Africa the Efik cook food and leave it on the table in the little shed or 'devil-house' near the grave, and thither not only the spirit of the deceased, but the spirits of the slaves sacrificed at his funeral, come to partake of it.[81] Farther south, in the Congo district, the custom has been described of making a channel into the tomb to the head or mouth of the corpse, whereby to send down month by month the offerings of food and drink.[82]

Among rude Asiatic tribes, the Bodo of North-East India thus celebrate the last funeral rites. The friends repair to the grave, and the nearest of kin to the deceased, taking an individual's usual portion of food and drink, solemnly presents it to the dead with these words, 'Take and eat, heretofore you have eaten and drunk with us, you can do so no more; you were one of us, you can be so no longer; we come no more to you, come you not to us.' Thereupon each of the party breaks off a bracelet of thread put on his wrist for this purpose, and casts it on the grave, a speaking symbol of breaking the bond of fellowship, and 'next the party proceed to the river and bathe, and having thus lustrated themselves, they repair to the banquet and eat, drink, and make merry as though they never were to die.'[83] With more continuance of affection, Naga tribes of Assam celebrate their funeral feasts month by month, laying food and drink on the graves of the departed.[84] In the same region of the world, the Kol tribes of Chota Nagpur are remarkable for their pathetic reverence for their dead. When a Ho or Munda has been burned on the funeral pile, collected morsels of his bones are carried in procession with a solemn, ghostly, sliding step, keeping time to the deep-sounding drum, and when the old woman who carries the bones on her bamboo tray lowers it from time to time, then girls who carry pitchers and brass vessels mournfully reverse them to show that they are empty; thus the remains are taken to visit every house in the village, and every dwelling of a friend or relative for miles, and the inmates come out to mourn and praise the goodness of the departed; the bones are carried to all the dead man's favourite haunts, to the fields he cultivated, to the grove he planted, to the threshing-floor where he worked, to the village dance-room where he made merry. At last they are taken to the grave, and buried in an earthen vase upon a store of food, covered with one of those huge stone slabs which European visitors wonder at in the districts of the aborigines in India. Besides these, monumental stones are set up outside the village to the memory of men of note; they are fixed on an earthen plinth, where the ghost, resting in its walks among the living, is supposed to sit shaded by the pillar. The Kheriahs have collections of these monuments in the little enclosures round their houses, and offerings and libations are constantly made at them. With what feelings such rites are celebrated may be judged from this Ho dirge:—

'We never scolded you; never wronged you; Come to us back! We ever loved and cherished you; and have lived long together Under the same roof; Desert it not now! The rainy nights, and the cold blowing days, are coming on; Do not wander here! Do not stand by the burnt ashes; come to us again! You cannot find shelter under the peepul, when the rain comes down. The saul will not shield you from the cold bitter wind. Come to your home! It is swept for you, and clean; and we are there who loved you ever; And there is rice put for you; and water; Come home, come home, come to us again!'

Among the Kol tribes this kindly hospitality to ancestral souls passes on into the belief and ceremony of full manes-worship: votive offerings are made to the 'old folks' when their descendants go on a journey, and when there is sickness in the family it is generally they who are first propitiated.[85] Among Turanian races, the Chuwash put food and napkins on the grave, saying, 'Rise at night and eat your fill, and there ye have napkins to wipe your mouths!' while the Cheremiss simply said, 'That is for you, ye dead, there ye have food and drink!' In this Tatar region we hear of offerings continued year after year, and even of messengers sent back by a horde to carry offerings to the tombs of their forefathers in the old land whence they had emigrated.[86]

Details of this ancient rite are to be traced from the level of these rude races far upward in civilization. South-East Asia is full of it, and the Chinese may stand as its representative. He keeps his coffined parent for years, serving him with meals as if alive. He summons ancestral souls with prayer and beat of drum to feed on the meat and drink set out on special days when they are thought

to return home. He even gives entertainments for the benefit of destitute and unfortunate souls in the lower regions, such as those of lepers and beggars. Lanterns are lighted to show them the way, a feast is spread for them, and with characteristic fancy, some victuals are left over for any blind or feeble spirits who may be late, and a pail of gruel is provided for headless souls, with spoons for them to put it down their throats with. Such proceedings culminate in the so-called Universal Rescue, now and then celebrated, when a little house is built for the expected visitors, with separate accommodation and bath-rooms for male and female ghosts.[87] The ancient Egyptian would set out his provision of cakes and trussed ducks on reed scaffolds in the tomb, or would even keep the mummy in the house to be present as a guest at the feast, σ■νδειπνον κα■ συμπ■την ■ποι■σατο, as Lucian says.[88] The Hindu, as of old, offers to the dead the funeral cakes, places before the door the earthen vessels of water for him to bathe in, of milk for him to drink, and celebrates at new and full moon the solemn presentation of rice-cakes made with ghee, with its attendant ceremonies so important for the soul's release from its twelvemonth's sojourn with Yama in Hades, and its transition to the Heaven of the Pitaras, the Fathers.[89] In the classic world such rites were represented by funeral feasts and oblations of food.[90]

In Christian times there manifests itself that interesting kind of survival which, keeping up the old ceremony in form, has adapted its motive to new thoughts and feelings. The classic funeral oblations became Christian, the silicernium was succeeded by the feast held at the martyr's tomb. Faustus inveighs against the Christians for carrying on the ancient rites: 'Their sacrifices indeed ye have turned into love-feasts, their idols into martyrs whom with like vows ye worship; ye appease the shades of the dead with wine and meals, ye celebrate the Gentiles' solemn days with them, such as calends and solstices,—of their life certainly ye have changed nought,'[91] and so forth. The story of Monica shows how the custom of laying food on the tomb for the manes passed into the ceremony, like to it in form, of setting food and drink to be sanctified by the sepulchre of a Christian saint. Saint-Foix, who wrote in the time of Louis XIV., has left us an account of the ceremonial after the death of a King of France, during the forty days before the funeral when his wax effigy lay in state. They continued to serve him at meal-times as though still alive, the officers laid the table, and brought the dishes, the maître d'hôtel handed the napkin to the highest lord present to be presented to the king, a prelate blessed the table, the basins of water were handed to the royal arm-chair, the cup was served in its due course, and grace was said in the accustomed manner, save that there was added to it the De Profundis.[92] Spaniards still offer bread and wine on the tombs of those they love, on the anniversary of their decease.[93] The conservative Eastern Church still holds to ancient rite. The funeral feast is served in Russia, with its tables for the beggars, laden with fish pasties and bowls of shchi and jugs of kvas, its more delicate dinner for friends and priests, its incense and chants of 'everlasting remembrance'; and even the repetition of the festival on the ninth, and twentieth, and fortieth day are not forgotten. The offerings of saucers of kutiya or kolyvo are still made in the church; this used to be of parboiled wheat and was deposited over the body, it is now made of boiled rice and raisins, sweetened with honey. In their usual mystic fashion, the Orthodox Christians now explain away into symbolism this remnant of primitive offering to the dead: the honey is heavenly sweetness, the shrivelled raisins will be full beauteous grapes, the grain typifies the resurrection, 'that which thou sowest is not quickened except it die.'[94]

In the calendar of many a people, differing widely as they may in race and civilization, there are to be found special yearly festivals of the dead. Their rites are much the same as those performed on other days for individuals; their season differs in different districts, but seems to have particular associations with harvest-time and the fall of the year, and with the year's end as reckoned at midwinter or in early spring.[95] The Karens make their annual offerings to the dead in the 'month of shades,' that is, December;[96] the Kocch of North Bengal every year at harvest-home offer fruits and a fowl to deceased parents;[97] the Barea of East Africa celebrate in November the feast of Thiyot, at once a feast of general peace and merry-making, of thanksgiving for the harvest, and of memorial for the deceased, for each of whom a little pot-full of beer is set out two days, to be drunk at last by the survivors;[98] in West Africa we hear of the feast of the dead at the time of yam-harvest;[99] at the end of the year the Haitian negroes take food to the graves for the shades to eat, 'manger zombi,' as they say.[100] The Roman Feralia and Lemuralia were held in February and May.[101] In the last five or ten days of their year the Zoroastrians hold their feasts for departed relatives, when souls come back to the world to visit the living, and receive from them offerings of food and clothing.[102] The custom of setting empty seats at the St. John's Eve feast, for the departed souls of kinsfolk, is said to have lasted on in Europe to the seventeenth century. Spring is the season of the time-honoured Slavonic rite of laying food on the graves of the dead. The Bulgarians hold a feast in the cemetery on Palm Sunday, and, after much eating and drinking, leave the remains upon the graves of their friends, who, they are persuaded, will eat them during the night. In Russia such scenes may still be watched on the two appointed days called Parents' Days. The higher classes have let the rite sink to prayer at the graves of lost relatives, and giving alms to the beggars who flock to the cemeteries. But the people still 'howl' for the dead, and set out on their graves a handkerchief for a tablecloth, with gingerbread, eggs, curd-tarts, and even vodka, on it; when the weeping is over, they eat up the food, especially commemorating the dead in Russian manner by partaking of his favourite dainty, and if he were fond of a glass, the vodka is sipped with the ejaculation, 'The

Kingdom of Heaven be his! He loved a drink, the deceased!'[103] When Odilo, Abbot of Cluny, at the end of the tenth century, instituted the celebration of All Souls' Day (November 2),[104] he set on foot one of those revivals which have so often given the past a new lease of life. The Western Church at large took up the practice, and round it there naturally gathered surviving remnants of the primitive rite of banquets to the dead. The accusation against the early Christians, that they appeased the shades of the dead with feasts like the Gentiles, would not be beside the mark now, fifteen hundred years later. On the eve of All Souls' begins, within the limits of Christendom, a commemoration of the dead which combines some touches of pathetic imagination with relics of savage animism scarcely to be surpassed in Africa or the South Sea Islands. In Italy the day is given to feasting and drinking in honour of the dead, while skulls and skeletons in sugar and paste form appropriate children's toys. In Tyrol, the poor souls released from purgatory fire for the night may come and smear their burns with the melted fat of the 'soul light' on the hearth, or cakes are left for them on the table, and the room is kept warm for their comfort. Even in Paris the souls of the departed come to partake of the food of the living. In Brittany the crowd pours into the churchyard at evening, to kneel bareheaded at the graves of dead kinsfolk, to fill the hollow of the tombstone with holy water, or to pour libations of milk upon it. All night the church bells clang, and sometimes a solemn procession of the clergy goes round to bless the graves. In no household that night is the cloth removed, for the supper must be left for the souls to come and take their part, nor must the fire be put out, where they will come to warm themselves. And at last, as the inmates retire to rest, there is heard at the door a doleful chant—it is the souls, who, borrowing the voices of the parish poor, have come to ask the prayers of the living.[105]

If we ask how the spirits of the dead are in general supposed to feed on the viands set before them, we come upon difficult questions, which will be met with again in discussing the theory of sacrifice. Even where the thought is certainly that the departed soul eats, this thought may be very indefinite, with far less of practical intention in it than of childish make-believe. Now and then, however, the sacrificers themselves offer closer definitions of their meaning. The idea of the ghost actually devouring the material food is not unexampled. Thus, in North America, Algonquin Indians considered that the shadow-like souls of the dead can still eat and drink, often even telling Father Le Jeune that they had found in the morning meat gnawed in the night by the souls. More recently, we read that some Potawatomis will leave off providing the supply of food at the grave if it lies long untouched, it being concluded that the dead no longer wants it, but has found a rich hunting-ground in the other world.[106] In Africa, again, Father Cavazzi records of the Congo people furnishing their dead with supplies of provisions, that they could not be persuaded that souls did not consume material food.[107] In Europe the Esths, offering food for the dead on All Souls', are said to have rejoiced if they found in the morning that any of it was gone.[108] A less gross conception is that the soul consumes the steam or savour of the food, or its essence or spirit. It is said to have been with such purpose that the Maoris placed food by the dead man's side, and some also with him in the grave.[109] The idea is well displayed among the natives in Mexican districts, where the souls who came to the annual feast are described as hovering over and smelling the food set out for them, or sucking out its nutritive quality.[110] The Hindu entreats the manes to quaff the sweet essence of the offered food; thinking on them, he slowly sets the dish of rice before the Brahmans, and while they silently eat the hot food, the ancestral spirits take their part of the feast.[111] At the old Slavonic meals for the dead, we read of the survivors sitting in silence and throwing morsels under the table, fancying that they could hear the spirits rustle, and see them feed on the smell and steam of the viands. One account describes the mourners at the funeral banquet inviting in the departed soul thought to be standing outside the door, and every guest throwing morsels and pouring drink under the table, for him to refresh himself. What lay on the ground was not picked up, but was left for friendless and kinless souls. When the meal was over, the priest rose from table, swept out the house, and hunted out the souls of the dead 'like fleas,' with these words, 'Ye have eaten and drunken, souls, now go, now go!'[112] Many travellers have described the imagination with which the Chinese make such offerings. It is that the spirits of the dead consume the impalpable essence of the food, leaving behind its coarse material substance, wherefore the dutiful sacrificers, having set out sumptuous feasts for ancestral souls, allow them a proper time to satisfy their appetite, and then fall to themselves.[113] The Jesuit Father Christoforo Borri suggestively translates the native idea into his own scholastic phraseology. In Cochin China, according to him, people believed 'that the souls of the dead have need of corporeal sustenance and maintenance, wherefore several times a year, according to their custom, they make splendid and sumptuous banquets, children to their deceased parents, husbands to their wives, friends to their friends, waiting a long while for the dead guest to come and sit down at table to eat.' The missionaries argued against this proceeding, but were met by ridicule of their ignorance, and the reply 'that there were two things in the food, one the substance, and the other the accidents of quantity, quality, smell, taste, and the like. The immaterial souls of the dead, taking for themselves the substance of the food, which being immaterial is food suited to the incorporeal soul, left only in the dishes the accidents which corporeal senses perceive; for this the dead had no need of corporeal instruments, as we have said.' Thereupon the Jesuit proceeds to remark, as to the prospect of conversion of these people, 'it may be judged from the distinction they make between the accidents and the substance of the food which they prepare for the dead,' that it will not be very difficult to prove to them the mystery of the

Eucharist.[114] Now to peoples among whom prevails the rite of feasts of the dead, whether they offer the food in mere symbolic pretence, or whether they consider the souls really to feed on it in this spiritual way (as well as in the cases inextricably mixed up with these, where the offering is spiritually conveyed away to the world of spirits), it can be of little consequence what becomes of the gross material food. When the Kafir sorcerer, in cases of sickness, declares that the shades of ancestors demand a particular cow, the beast is slaughtered and left shut up for a time for the shades to eat, or for its spirit to go to the land of shades, and then is taken out to be eaten by the sacrificers.[115] So, in more civilized Japan, when the survivors have placed their offering of unboiled rice and water in a hollow made for the purpose in a stone of the tomb, it seems to them no matter that the poor or the birds really carry off the grain.[116]

Such rites as these are especially exposed to dwindle in survival. The offerings of meals and feasts to the dead may be traced at their last stage into mere traditional ceremonies, at most tokens of affectionate remembrance of the dead, or works of charity to the living. The Roman Feralia in Ovid's time were a striking example of such transition, for while the idea was recognized that the ghosts fed upon the offerings, 'nunc posito pascitur umbra cibo,' yet there were but 'parva munera,' fruits and grains of salt, and corn soaked in wine, set out for their meal in the middle of the road. 'Little the manes ask, the pious thought stands instead of the rich gift, for Styx holds no greedy gods:'—

'Parva petunt manes. Pietas pro divite grata est Munere. Non avidos Styx habet ima deos. Tegula porrectis satis est velata coronis, Et sparsae fruges, parcaque mica salis, Inque mero mollita ceres, violaeque solutae: Haec habeat media testa relicta via. Nec majora veto. Sed et his placabilis umbra est.'[117]

Still farther back, in old Chinese history, Confucius had been called on to give an opinion as to the sacrifices to the dead. Maintainer of all ancient rites as he was, he stringently kept up this, 'he sacrificed to the dead as if they were present,' but when he was asked if the dead had knowledge of what was done or no, he declined to answer the question; for if he replied yes, then dutiful descendants would injure their substance by sacrifices, and if no, then undutiful children would leave their parents unburied. The evasion was characteristic of the teacher who expressed his theory of worship in this maxim, 'to give oneself earnestly to the duties due to men, and, while respecting spiritual beings, to keep aloof from them, may be called wisdom.' It is said that in our own time the Taepings have made a step beyond Confucius; they have forbidden the sacrifices to the spirits of the dead, yet keep up the rite of visiting their tombs on the customary day, for prayer and the renewal of vows.[118] How funeral offerings may pass into commemorative banquets and feasts to the poor, has been shown already. If we seek in England for vestiges of the old rite of funeral sacrifice, we may find a lingering survival into modern centuries, doles of bread and drink given to the poor at funerals, and 'soul-mass cakes' which peasant girls perhaps to this day beg for at farmhouses with the traditional formula,

'Soul, soul, for a soul cake, Pray you, mistress, a soul cake.'[119]

Were it not for our knowledge of the intermediate stages through which these fragments of old custom have come down, it would seem far-fetched indeed to trace their origin back to the savage and barbaric times of the institution of feasts of departed souls.

Since the first publication of the above remark, M. Louis Figuier has supplied a perfect modern instance by his book, entitled ‘Le Lendemain de la Mort,’ translated into English as ‘The Day after Death: Our Future Life according to Science.’ His attempt to revive the ancient belief, and to connect it with the evolution-theory of modern naturalists, is carried out with more than Buddhist elaborateness. Body is the habitat of soul, which goes out when a man dies, as one forsakes a burning house. In the course of development, a soul may migrate through bodies stage after stage, zoophyte and oyster, grasshopper and eagle, crocodile and dog, till it arrives at man, thence ascending to become one of the superhuman beings or angels who dwell in the planetary ether, and thence to a still higher state, the secret of whose nature M. Figuier does not endeavour to penetrate, ‘because our means of investigation fail at this point.’ The ultimate destiny of the more glorified being is the Sun; the pure spirits who form its mass of burning gases, pour out germs and life to start the course of planetary existence. (Note to 2nd edition.)

Petrus Damianus, ‘Vita S. Odilonis,’ in the Bollandist ‘Acta Sanctorum,’ Jan. 1, has the quaint legend attached to the new ordinance. An island hermit dwelt near a volcano, where souls of the wicked were tormented in the flames. The holy man heard the officiating demons lament that their daily task of new torture was interfered with by the prayers and alms of devout persons leagued against them to save souls, and especially they complained of the Monks of Cluny. Thereupon the hermit sent a message to Abbot Odilo, who carried out the work to the efficacy of which he had received such perfect spiritual testimony, by decreeing that November 2, the day after All Saints’, should be set apart for services for the departed.

The following passage from a spiritualist journal, ‘The Medium,’ Feb. 9, 1872, shows this primitive notion curiously surviving in modern England. ‘Every time we sat at dinner, we had not only spirit-voices calling to us, but spirit-hands touching us; and last evening, as it was his farewell, they gave us a special manifestation, unasked for and unlooked for. He sitting at the right hand of me, a vacant chair opposite to him began moving, and, in answer to whether it would have some dinner, said “Yes.” I then asked it to select what it would take, when it chose _croquets des pommes de terre_ (a French way of dressing potatoes, about three inches long and two wide. I will send you one that you may see it). I was desired to put this on the chair, either in a tablespoon or on a plate. I placed it in a tablespoon, thinking that probably the plate might be broken. In a few seconds I was told that it was eaten, and looking, found the half of it gone, with the marks showing the teeth.’ (Note to 2nd ed.)

CHAPTER XIII. ANIMISM (_continued_).

Journey of the Soul to the Land of the Dead—Visits by the Living to the Regions of Departed Souls—Connexion of such legends with myths of Sunset: the Land of the Dead thus imagined as in the West—Realization of current religious ideas, whether of savage or civilized theology, in narratives of visits to the Regions of Souls—Localization of the Future Life—Distant earthly region: Earthly Paradise, Isles of the Blest—Subterranean Hades or Sheol—Sun, Moon, Stars—Heaven—Historical course of belief as to such localization—Nature of Future Life—Continuance-theory, apparently original, belongs especially to the lower races—Transitional theories—Retribution-theory, apparently derived, belongs especially to the higher races—Doctrine of Moral Retribution as developed in the higher culture—Survey of Doctrine of Future State, from savage to civilized stages—Its practical effect on the sentiment and conduct of Mankind.

The departure of the dead man's soul from the world of living men, its journey to the distant land of spirits, the life it will lead in its new home, are topics on which the lower races for the most part hold explicit doctrines. When these fall under the inspection of a modern ethnographer, he treats them as myths; often to a high degree intelligible and rational in their origin, consistent and regular in their structure, but not the less myths. Few subjects have aroused the savage poet's mind to such bold and vivid imagery as the thought of the hereafter. Yet also a survey of its details among mankind displays in the midst of variety a regular recurrence of episode which brings the ever-recurring question, how far is this correspondence due to transmission of the same thought from tribe to tribe, and how far to similar but independent development in distant lands?

From the savage state up into the midst of civilization, the comparison may be carried through. Low races and high, in region after region, can point out the very spot whence the flitting souls start to travel toward their new home. At the extreme western cape of Vanua Levu, a calm and solemn place of cliff and forest, the souls of the Fijian dead embark for the judgement-seat of Ndengei, and thither the living come in pilgrimage, thinking to see their ghosts and gods.[120] The Baperi of South Africa will venture to creep a little way into their cavern of Marimatlé, whence men and animals came forth into the world, and whither souls return at death.[121] In Mexico the cavern of Chalchatongo led to the plains of paradise, and the Aztec name of Mictlan, 'Land of the Dead,' now Mitla, keeps up the remembrance of another subterranean temple which opened the way to the sojourn of the blessed.[122] How naturally a dreary place, fit rather for the dead than the living, suggests the thought of an entrance to the land of the departed, is seen in the fictitious travels known under the name of Sir John Mandevill, where the description of the Vale Perilous, adapted from the terrible valley which Friar Odoric had seen full of corpses and heard resound with strange noise of drums, has this appropriate ending: 'This vale es full of deuilles and all way has bene; and men saise in that cuntree that thare es ane entree to hell.'[123] In more genuine folklore, North German peasants still remember on the banks of the swampy Drömling the place of access to the land of departed souls.[124] To us Englishmen the shores of lake Avernus, trodden daily by our tourists, are more familiar than the Irish analogue of the place, Lough Derg, with its cavern entrance of St. Patrick's Purgatory leading down to the awful world below. The mass of mystic details need not be repeated here of the soul's dread journey by caverns and rocky paths and weary plains, over steep and slippery mountains, by frail bark or giddy bridge across gulfs or rushing rivers, abiding the fierce onset of the soul-destroyer or the doom of the stern guardian of the other world. But before describing the spirit-world which is the end of the soul's journey, let us see what the proof is which sustains the belief in both. The lower races claim to hold their doctrines of the future life on strong tradition, direct revelation, and even personal experience. To them the land of souls is a discovered country, from whose bourne many a traveller returns.

Among the legendary visits to the world beyond the grave, there are some that seem pure myth, without a touch of real personal history. Ojibwa, the eponymic hero of his North American tribe, as one of his many exploits descended to the subterranean world of departed spirits, and came up again to earth.[125] When the Kamchadals were asked how they knew so well what happens to men after death, they could answer with their legend of Haetsh the first man. He died and went down into the world below, and a long while after came up again to his former dwelling, and there, standing above by the smoke-hole, he talked down to his kindred in the house and told them about the life to come; it was then that his two daughters whom he had left below followed him in anger and smote him so that he died a second time, and now he is chief in the lower world, and receives the Italmen when they die and rise anew.[126] Thus, again, in the great Finnish epic, the Kalewala, one great episode is Wainamoinen's visit to the land of the dead. Seeking the last charm-words to build his boat, the hero travelled with quick steps week after week through bush and wood till he came to the Tuonela river, and saw before him the island of Tuoni the god of death. Loudly he called to Tuoni's daughter to bring the ferry-boat across:—

‘She, the virgin of Manala, She, the washer of the clothing, She, the wringer of the linen, By the river of Tuonela, In the under-world Manala, Spake in words, and this their meaning, This their answer to the hearer:— “Forth the boat shall come from hither, When the reason thou hast given That hath brought thee to Manala, Neither slain by any sickness, Nor by Death dragged from the living, Nor destroyed by other ending.”’

Wainamoinen replies with lying reasons. Iron brought him, he says, but Tuoni’s daughter answers that no blood drips from his garment; Fire brought him, he says, but she answers that his locks are unsinged, and at last he tells his real mission. Then she ferries him over, and Tuonetar the hostess brings him beer in the two-eared jug, but Wainamoinen can see the frogs and worms within and will not drink, for it was not to drain Manala’s beer-jug he had come. He lay in the bed of Tuoni, and meanwhile they spread the hundred nets of iron and copper across the river that he might not escape; but he turned into a reed in the swamp, and as a snake crept through the meshes:—

‘Tuoni’s son with hooked fingers Iron-pointed hooked fingers Went to draw his nets at morning— Salmon-trout he found a hundred, Thousands of the little fishes, But he found no Wainamoinen, Not the old friend of the billows. Then the ancient Wainamoinen, Come from out of Tuoni’s kingdom, Spake in words, and this their meaning, This their answer to the hearer:— “Never mayst thou, God of goodness, Never suffer such another Who of self-will goes to Mana, Thrusts his way to Tuoni’s kingdom. Many they who travel thither, Few who thence have found the home-way, From the houses of Tuoni From the dwellings of Manala.”’[127]

It is enough to name the familiar classic analogues of these mythic visits to Hades,—the descent of Dionysos to bring back Semele, of Orpheus to bring back his beloved Eurydike, of Herakles to fetch up the three-headed Kerberos at the command of his master Eurystheus; above all, the voyage of Odysseus to the ends of the deep-flowing Ocean, to the clouded city of Kimmerian men, where shining Helios looks not down with his rays, and deadly night stretches always over wretched mortals,—thence they passed along the banks to the entrance of the land where the shades of the departed, quickened for a while by the taste of sacrificial blood, talked with the hero and showed him the regions of their dismal home.[128]

The scene of the descent into Hades is in very deed enacted day by day before our eyes, as it was before the eyes of the ancient myth-maker, who watched the sun descend to the dark under-world, and return at dawn to the land of living men. These heroic legends lie in close-knit connexion with episodes of solar myth. It is by the simplest poetic adaptation of the Sun’s daily life, typifying Man’s life in dawning beauty, in mid-day glory, in evening death, that mythic fancy even fixed the belief in the religions of the world, that the Land of Departed Souls lies in the Far West or the World Below. How deeply the myth of the Sunset has entered into the doctrine of men concerning a Future State, how the West and the Under-World have become by mere imaginative analogy Regions of the Dead, how the quaint day-dreams of savage poets may pass into honoured dogmas of classic sages and modern divines,—all this the crowd of details here cited from the wide range of culture stand to prove.

Moreover, visits from or to the dead are matters of personal experience and personal testimony. When in dream or vision the seer beholds the spirits of the departed, they give him tidings from the other world, or he may even rise and travel thither himself, and return to tell the living what he has seen among the dead. It is sometimes as if the traveller’s material body went to visit a distant land, and sometimes all we are told is that the man’s self went, but whether in body or in spirit is a mere detail of which the story keeps no record. Mostly, however, it is the seer’s soul which goes forth, leaving his body behind in ecstasy, sleep, coma, or death. Some of these stories, as we trace them on from savage into civilized times, are no doubt given in good faith by the visionary himself, while others are imitations of these genuine accounts.[129] Now such visions are naturally apt to reproduce the thoughts with which the seer’s mind was already furnished. Every idea once lodged in the mind of a savage, a barbarian, or an enthusiast, is ready thus to be brought back to him from without. It is a vicious circle; what he believes he therefore sees, and what he sees he therefore believes. Beholding the reflexion of his own mind like a child looking at itself in a glass, he humbly receives the teaching of his second self. The Red Indian visits his happy hunting-grounds, the Tongan his shadowy island of Bolotu, the Greek enters Hades and looks on the Elysian Fields, the Christian beholds the heights of Heaven and the depths of Hell.

Among the North American Indians, and especially the Algonquin tribes, accounts are not unusual of men whose spirits, travelling in dreams or in the hallucinations of extreme illness to the land of the dead, have returned to reanimate their bodies, and tell what they have seen. Their experiences have been in great measure what they were taught in early childhood to expect, the journey along the path of the dead, the monstrous strawberry at which the jebi-ug or ghosts refresh themselves, but which turns to red rock at the touch of their spoons, the bark offered them for dried meat and great puff-balls for squashes, the river of the dead with its snake-bridge or swinging log, the great dog standing on the other side, the villages of the dead beyond.[130] The Zulus of our own day tell of men who have gone down by holes in the ground into the underworld, where mountains and rivers and all things are as

here above, and where a man may find his kindred, for the dead live in their villages, and may be seen milking their cattle, which are the cattle killed on earth and come to life anew. The Zulu Umpengula, who told one of these stories to Dr. Callaway, remembered when he was a boy seeing an ugly little hairy man called Uncama, who once, chasing a porcupine that ate his mealies, followed it down a hole in the ground into the land of the dead. When he came back to his home on earth he found that he had been given up for dead himself, his wife had duly burnt and buried his mats and blankets and vessels, and the wondering people at sight of him again shouted the funeral dirge. Of this Zulu Dante it used to be continually said, 'There is the man who went to the underground people.'[131] One of the most characteristic of these savage narratives is from New Zealand. This story, which has an especial interest from the reminiscence it contains of the gigantic extinct Moa, and which may be repeated at some length as an illustration of the minute detail and lifelike reality which such visionary legends assume in barbaric life, was told to Mr. Shortland by a servant of his named Te Wharewera. An aunt of this man died in a solitary hut near the banks of Lake Rotorua. Being a lady of rank she was left in her hut, the door and windows were made fast, and the dwelling was abandoned, as her death had made it tapu. But a day or two after, Te Wharewera with some others paddling in a canoe near the place at early morning saw a figure on the shore beckoning to them. It was the aunt come to life again, but weak and cold and famished. When sufficiently restored by their timely help, she told her story. Leaving her body, her spirit had taken flight toward the North Cape, and arrived at the entrance of Reigna. There, holding on by the stem of the creeping akeake-plant, she descended the precipice, and found herself on the sandy beach of a river. Looking round, she espied in the distance an enormous bird, taller than a man, coming towards her with rapid strides. This terrible object so frightened her, that her first thought was to try to return up the steep cliff; but seeing an old man paddling a small canoe towards her she ran to meet him, and so escaped the bird. When she had been safely ferried across she asked the old Charon, mentioning the name of her family, where the spirits of her kindred dwelt. Following the path the old man pointed out, she was surprised to find it just such a path as she had been used to on earth; the aspect of the country, the trees, shrubs, and plants were all familiar to her. She reached the village and among the crowd assembled there she found her father and many near relations; they saluted her, and welcomed her with the wailing chant which Maoris always address to people met after long absence. But when her father had asked about his living relatives, and especially about her own child, he told her she must go back to earth, for no one was left to take care of his grandchild. By his orders she refused to touch the food that the dead people offered her, and in spite of their efforts to detain her, her father got her safely into the canoe, crossed with her, and parting gave her from under his cloak two enormous sweet potatoes to plant at home for his grandchild's especial eating. But as she began to climb the precipice again, two pursuing infant spirits pulled her back, and she only escaped by flinging the roots at them, which they stopped to eat, while she scaled the rock by help of the akeake-stem, till she reached the earth and flew back to where she had left her body. On returning to life she found herself in darkness, and what had passed seemed as a dream, till she perceived that she was deserted and the door fast, and concluded that she had really died and come to life again. When morning dawned, a faint light entered by the crevices of the shut-up house, and she saw on the floor near her a calabash partly full of red ochre mixed with water; this she eagerly drained to the dregs, and then feeling a little stronger, succeeded in opening the door and crawling down to the beach, where her friends soon after found her. Those who listened to her tale firmly believed the reality of her adventures, but it was much regretted that she had not brought back at least one of the huge sweet-potatoes, as evidence of her visit to the land of spirits.[132] Races of North Asia[133] and West Africa[134] have in like manner their explorers of the world beyond the grave.

Classic literature continues the series. Lucian's graphic tales represent the belief of their age, if not of their author. His Eukrates looks down the chasm into Hades, and sees the dead reclining on the asphodel in companies of kinsfolk and friends; among them he recognizes Sokrates with his bald head and pot-belly, and also his own father, dressed in the clothes he was buried in. Then Kleodemos caps this story with his own, how when he was sick, on the seventh day when his fever was burning like a furnace, every one left him, and the doors were shut. Then there stood before him an all-beauteous youth in a white garment, who led him through a chasm into Hades, as he knew by seeing Tantalos and Tityos and Sisyphos; and bringing him to the court of judgement, where were Aiakos and the Fates and the Erinyes, the youth set him before Pluto the King, who sat reading the names of those whose day of life was over. But Pluto was angry, and said to the guide, 'This one's thread is not run out, that he should depart, but bring me Demylos the coppersmith, for he is living beyond the spindle.' So Kleodemos came back to himself free from his fever and announced that Demylos, who was a sick neighbour, would die; and accordingly a little while after there was heard the cry of the mourners wailing for him.[135] Plutarch's stories, told more seriously, are yet one in type with the mocking Lucian's. The wicked, pleasure-seeking Thespesios lies three days as dead, and revives to tell his vision of the world below. One Antyllos was sick, and seemed to the doctors to retain no trace of life; till, waking without sign of insanity, he declared that he had been indeed dead, but was ordered back to life, those who brought him being severely chidden by their lord, and sent to fetch Nikander instead, a well-known currier, who was accordingly taken with a fever, and died on the third day.[136] Such stories, old and new, are current

among the Hindus at this day. A certain man's soul, for instance, is carried to the realm of Yama by mistake for a namesake, and is sent back in haste to regain his body before it is burnt; but in the meanwhile he has a glimpse of the hideous punishments of the wicked, and of the glorious life of those who had mortified the flesh on earth, and of suttee-widows now sitting in happiness by their husbands.[137] Mutatis mutandis these tales reappear in Christian mythology, as when Gregory the Great records that a certain nobleman named Stephen died, who was taken to the region of Hades, and saw many things he had heard before but not believed; but when he was set before the ruler there presiding, he sent him back, saying that it was this Stephen's neighbour—Stephen the smith—whom he had commanded to be brought; and accordingly the one returned to life, and the other died.[138]

The thought of human visitors revealing the mysteries of the world beyond the grave, which indeed took no slight hold on Christian belief, attached itself in a remarkable way to the doctrine of Christ's descent into Hades. This dogma had so strongly established itself by the end of the 4th century, that Augustine could ask, 'Quis nisi infidelis negaverit fuisse apud inferos Christum?'[139] A distinct statement of the dogma was afterwards introduced into the symbol commonly called the 'Apostles' Creed:' 'Descendit ad inferos,' 'Descendit ad inferna,' 'He descended into hell.'[140] The Descent into Hades, which had the theological use of providing a theory of salvation applicable to the saints of the old covenant, imprisoned in the limbo of the fathers, is narrated in full in the apocryphal Gospel of Nicodemus, and is made there to rest upon a legend which belongs to the present group of human visits to the other world. It is related that two sons of Simeon, named Charinus and Leucius, rose from their tombs at the Resurrection, and went about silently and prayerfully among men, till Annas and Caiaphas brought them into the synagogue, and charged them to tell of their raising from the dead. Then, making the sign of the cross upon their tongues, the two asked for parchment and wrote their record. They had been set with all their fathers in the depths of Hades, when on a sudden there appeared the colour of the sun like gold, and a purple royal light shining on them; then the patriarchs and prophets, from Adam to Simeon and John the Baptist, rejoicing proclaimed the coming of the light and the fulfilment of the prophecies; Satan and Hades wrangled in strife together; in vain the brazen gates were shut with their iron bars, for the summons came to open the gates that the king of glory may come in, who hath broken the gates of brass and cut the bars of iron in sunder; then the mighty Lord broke the fetters and visited them who sat in darkness and the shadow of death; Adam and his righteous children were delivered from Hades, and led into the glorious grace of Paradise.[141]

Dante, elaborating in the 'Divina Commedia' the conceptions of paradise, purgatory, and hell familiar to the actual belief of his age, describes them once more in the guise of a living visitor to the land of the dead. Echoes in mediæval legend of such exploring expeditions to the world below still linger faintly in the popular belief of Europe. It has been thus with St. Patrick's Purgatory,[142] the cavern in the island of Lough Derg, in the county Donegal, which even in the seventeenth century O'Sullevan could describe first and foremost in his 'Catholic History' as 'the greatest of all memorable things of Ireland.' Mediæval visits to the other world were often made in the spirit. But like Ulysses, Wainamoinen, and Dante, men could here make the journey in body, as did Sir Owain and the monk Gilbert. When the pilgrim had spent fifteen days in prayer and fasting in the church, and had been led with litanies and sprinkling of holy water to the entrance of the purgatory, and the last warnings of the monks had failed to turn him from his venture, the door was closed upon him, and if found next morning, he could tell the events of his awful journey—how he crossed the narrow bridge that spans the river of death, how he saw the hideous torments of hell, and approached the joys of paradise. Sir Owain, one of King Stephen's knights, went thither in penance for his life of violence and rapine, and this was one of the scenes he beheld in purgatory:—

'There come develes other mony mo, And badde the knygth with hem to go, And ladde him into a fowle contreye, Where ever was nygth and never day, For hit was derke and wonther colde: Yette was there never man so bolde, Hadde he never so mony clothes on, But he wolde be colde as ony stone. Wynde herde he none blowe, But faste hit frese bothe hye and lowe. They browgte him to a felde full brode, Overe suche another never he yode, For of the lengthe none ende he knewe Thereover algate he moste nowe. As he wente he herde a crye, He wondered what hit was, and why, He syg ther men and wymmen also That lowde cryed, for hem was woo. They leyen thykke on every londe, Faste nayled bothe fote and honde With nayles glowyng alle of brasse: They ete the erthe so wo hem was; Here face was nayled to the grownde. "Spare," they cryde, "a lytylle stounde." The develes wolde hem not spare: To hem peyne they thowgte yare.'

When Owain had seen the other fields of punishment, with their fiery serpents and toads, and the fires where sinners were hung up by their offending members, and roasted on spits, and basted with molten metal, and turned about on a great wheel of fire, and when he had passed the Devil's Mouth over the awful bridge, he reached the fair white glassy wall of the Earthly Paradise, reaching upward and upward, and saw before him the beautiful gate, whence issued a ravishing perfume. Then he soon forgot his pains and sorrows.

‘As he stode, and was so fayne, Hym thowgth ther come hym agayne A swyde fayr processyoun Of alle manere menne of relygyoun, Fayre vestementes they hadde on, So ryche syg he never none. Myche joye hym thowgte to se Bysshopes yn here dygnité; Ilkone wente other be and be, Every man yn his degré. He syg ther monkes and chanones, And freres with newe shavene crownes; Ermytes he saw there amonge, And nonnes with fulle mery songe; Persones, prestes, and vycaryes; They made fulle mery melodyes. He syg ther kynges and emperoures, And dukes that had casteles and toures, Erles and barones fele, That some tyme hadde the worldes wele. Other folke he syg also, Never so mony as he dede thoo. Wymmen he syg ther that tyde: Myche was the joye ther on every syde: For alle was joye that with hem ferde, And myche solempnyté he herde.’

The procession welcomed Owain, and led him about, showing him the beauties of that country:—

‘Hyt was grene, and fulle of flowres Of mony dyvers colowres; Hyt was grene on every syde, As medewus are yn someres tyde. Ther were trees growyng fulle grene Fulle of fruyte ever more, y wene; For ther was frwyte of mony a kynde, Such yn the londe may no mon fynde. Ther they have the tree of lyfe, Theryn ys myrthe, and never stryfe; Frwyte of wysdom also ther ys, Of the whyche Adam and Eve dede amysse: Other manere frwytes ther were fele, And alle manere joye and wele. Moche folke he syg ther dwelle, There was no tongue that mygth hem telle; Alle were they cloded yn ryche wede, What cloth hit was he kowthe not rede.

There was no wronge, but ever rygth, Ever day and nevere nygth. They shone as brygth and more clere Than ony sonne yn the day doth here.’

The poem, in fifteenth-century English, from which these passages are taken, is a version of the original legend of earlier date, and as such contrasts with a story really dating from early in the fifteenth century—William Staunton’s descent into Purgatory, where the themes of the old sincerely-believed visionary lore are fading into moral allegory, and the traveller sees the gay gold and silver collars and girdles burning into the wearer’s flesh, and the jags that men were clothed in now become adders and dragons, sucking and stinging them, and the fiends drawing down the skin of women’s shoulders into pokes, and smiting into their heads with burning hammers their gay chaplets of gold and jewels turned to burning nails, and so forth. Late in this fifteenth century, St. Patrick’s Purgatory fell into discredit, but even the destruction of the entrance-building, in 1479, by Papal order, did not destroy the ideal road. About 1693, an excavation on the spot brought to light a window with iron stanchions; there was a cry for holy water to keep the spirits from breaking out from prison, and the priest smelt brimstone from the dark cavity below, which, however, unfortunately turned out to be a cellar. In still later times, the yearly pilgrimage of tens of thousands of votaries to the holy place has kept up this interesting survival from the lower culture, whereby a communication may still be traced, if not from Earth to Hades, at least from the belief of the New Zealander to that of the Irish peasant.

To study and compare the ideal regions where man has placed the abodes of departed souls is not an unprofitable task. True, geography has now mapped out into mere earth and water the space that lay beyond the narrower sea and land known to the older nations, and astronomy no longer recognizes the flat earth trodden by men as being the roof of subterranean halls, nor the sky as being a solid firmament, shutting out men’s gaze from strata or spheres of empyræan regions beyond. Yet if we carry our minds back to the state of knowledge among the lower races, we shall not find it hard to understand the early conceptions as to the locality of the regions beyond the grave. They are no secrets of high knowledge made known to sages of old; they are the natural fancies which childlike ignorance would frame in any age. The regularity with which such conceptions repeat themselves over the world bears testimony to the regularity of the processes by which opinion is formed among mankind. At the same time, the student who carefully compares them will find in them a perfect illustration of an important principle, widely applicable to the general theory of the formation of human opinion. When a problem has presented itself to mankind at large, susceptible of a number of solutions about equally plausible, the result is that the several opinions thus produced will be found lying scattered in country after country. The problem here is, given the existence of souls of the dead who from time to time visit the living, where is the home of these ghosts? Why men in one district should have preferred the earth, in another the under-world, in another the sky, as the abode of departed souls, is a question often difficult to answer. But we may at least see how again and again the question was taken in hand, and how out of the three or four available answers some peoples adopted one, some another, some several at once. Primitive theologians had all the world before them where to choose their place of rest for the departed, and they used to the full their speculative liberty.

Firstly, when the land of souls is located on the surface of the earth, there is choice of fit places among wild and cloudy precipices, in secluded valleys, in far-off plains and islands. In Borneo, Mr. St. John visited the heaven of the Idaan race, on the summit of Kina Balu, and the native guides, who feared to pass the night in this abode of spirits, showed the traveller the moss on which the souls

of their ancestors fed, and the footprints of the ghostly buffaloes that followed them. On Gunung Danka, a mountain in West Java, there is such another ‘Earthly Paradise.’ The Sajira who dwell in the district indeed profess themselves Mohammedans, but they secretly maintain their old belief, and at death or funeral they enjoin the soul in solemn form to set aside the Moslem Allah, and to take the way to the dwelling-place of his own forefathers’ souls:—

‘Step up the bed of the river, and cross the neck of land, Where the aren trees stand in a clump, and the pinangs in a row, Thither direct thy steps, Laillah being set aside.’

Mr. Jonathan Rigg had lived ten years among these people, and knew them well, yet had never found out that their paradise was on this mountain. When at last he heard of it, he made the ascent, finding on the top only a few river-stones, forming one of the balai, or sacred cairns, common in the district. But the popular belief, that a tiger would devour the chiefs who permitted a violation of the sacred place, soon received the sort of confirmation which such beliefs receive everywhere, for a tiger killed two children a few days later, and the disaster was of course ascribed to Mr. Rigg’s profanation.[143] The Chilians said that the soul goes westward over the sea to Gulcheman, the dwelling-place of the dead beyond the mountains; life, some said, was all pleasure there, but others thought that part would be happy and part miserable.[144] Hidden among the mountains of Mexico lay the joyous garden-land of Tlalocan, where maize, and pumpkins, and chilis, and tomatos never failed, and where abode the souls of children sacrificed to Tlaloc, its god, and the souls of such as died by drowning or thunderstroke, or by leprosy or dropsy, or other acute disease.[145] A survival of such thought may be traced into mediæval civilization, in the legends of the Earthly Paradise, the fire-girt abode of saints not yet raised to highest bliss, localized in the utmost East of Asia, where earth stretches up towards heaven.[146] When Columbus sailed west-ward across the Atlantic to seek ‘the new heaven and the new earth’ he had read of in Isaiah, he found them, though not as he sought. It is a quaint coincidence that he found there also, though not as he sought it, the Earthly Paradise which was another main object of his venturous quest. The Haitians described to the white men their Coaibai, the paradise of the dead, in the lovely Western valleys of their island, where the souls hidden by day among the cliffs came down at night to feed on the delicious fruit of the mamey-trees, of which the living ate but sparingly, lest the souls of their friends should want.[147]

Secondly, there are Australians who think that the spirit of the dead hovers awhile on earth and goes at last toward the setting sun, or westward over the sea to the island of souls, the home of his fathers. Thus these rudest savages have developed two thoughts which we meet with again and again far onward in the course of culture—the thought of an island of the dead, and the thought that the world of departed souls is in the West, whither the Sun descends at evening to his daily death.[148] Among the North American Indians, when once upon a time an Algonquin hunter left his body behind and visited the land of souls in the sunny south, he saw before him beautiful trees and plants, but found he could walk right through them. Then he paddled in the canoe of white shining stone across the lake where wicked souls perish in the storm, till he reached the beautiful and happy island where there is no cold, no war, no bloodshed, but the creatures run happily about, nourished by the air they breathe.[149] Tongan legend says that, long ago, a canoe returning from Fiji was driven by stress of weather to Bolotu, the island of gods and souls lying in the ocean north-west of Tonga. That island is larger than all theirs together, full of all finest fruits and loveliest flowers, that fill the air with fragrance, and come anew the moment they are plucked; birds of beauteous plumage are there, and hogs in plenty, all immortal save when killed for the gods to eat, and then new living ones appear immediately to fill their places. But when the hungry crew of the canoe landed, they tried in vain to pluck the shadowy bread-fruit, they walked through unresisting trees and houses, even as the souls of chiefs who met them walked unchecked through their solid bodies. Counselled to hasten home from this land of no earthly food, the men sailed to Tonga, but the deadly air of Bolotu had infected them, and they soon all died.[150]

Such ideas took strong hold on classic thought, in the belief in a paradise in the Fortunate Islands of the far Western Ocean. Hesiod in the ‘Works and Days’ tells of the half-gods of the Fourth Age, between the Age of Bronze and the Age of Iron. When death closed on this heroic race, Zeus granted them at the ends of Earth a life and home, apart from man and far from the immortals. There Kronos reigns over them, and they dwell careless in the Islands of the Happy, beside deep-eddying Ocean—blest heroes, for whom the grain-giving field bears, thrice blooming yearly, the honey-sweet fruit:—

‘■νθ’ ■τοι το■ς μ■ν θαν■του τ■λος ■μφεκ■λυψε· Τοῖς δ■ δ■χ’ ■νθρ■πον β■οτον κα■ ■θ■ ■π■σσας Ζε■ς Κρον■δες κατ■νασσε πατ■ρ ■ς πε■ρατα γα■ες, Τηλο■ ■π’ ■θαν■τον· το■σιν Κρ■νος ■μβασιλε■ει· Κα■ το■ μ■ν να■ουσιν ■κηδ■α θυμ■ν ■χοντες ■ν μακ■ρον ν■σοισι παρ’ ■κεαν■ν βαθυδ■νεν, ■λβιοι ■ροες, το■σιν μελιεδ■α καρπ■ν Τρ■ς ■τεος θ■λλοντα φ■ρει ζε■δωρος ■ρουρα.’[151]

These Islands of the Blest, assigned as the abode of blessed spirits of the dead, came indeed to be identified with the Elysian Fields. Thus Pindar sings of steadfast souls, who through three lives on either side have endured free from injustice; then they pass by the road of Zeus to the tower of Kronos, where the ocean breezes blow round the islands of the happy, blazing with golden flowers of land and water. Thus, also, in the famous hymn of Kallistratos in honour of Harmodios and Aristogeiton, who slew the tyrant Hipparchos:—

'Φ■λταθ' ■ρμ■δ■, ο■ τι πω τ■θνηκας Ν■σοις δ' ■ν μακ■ρων σε φασ■ν εἶναι, ■να περ ποδ■κες ■χιλλε■ς, Τυδε■δεν τε φασ■ τ■ν ■σθλ■ν Διομ■δεα.'[152]

This group of legends has especial interest to us Englishmen, who ourselves dwell, it seems, on such an island of the dead. It is not that we or our country are of a more ghostly nature than others, but the idea is geographical we are dwellers in the region of the setting sun, the land of death. The elaborate account by Procopius, the historian of the Gothic War, dates from the 6th century. The island of Brittia, according to him, lies opposite the mouths of the Rhine, some 200 stadia off, between Britannia and Thule, and on it dwell three populous nations, the Angles, Frisians, and Britons. (By Brittia, it appears, he means our Great Britain, his Britannia being the coast-land from modern Brittany to Holland, and his Thule being Scandinavia.) In the course of his history it seems to him needful to record a story, mythic and dreamlike as he thinks, yet which numberless men vouch for as having been themselves witnesses by eye and ear to its facts. This story is that the souls of the departed are conveyed across the sea to the island of Brittia. Along the mainland coast are many villages, inhabited by fishermen and tillers of the soil and traders to this island in their vessels. They are subject to the Franks, but pay no tribute, having from of old had to do by turns the burdensome service of transporting the souls. Those on duty for each night stay at home till they hear a knocking at the doors, and a voice of one unseen calling them to their work. Then without delay rising from their beds, compelled by some unknown power they go down to the beach, and there they see boats, not their own but others, lying ready but empty of men. Going on board and taking the oars, they find that by the burden of the multitude of souls embarked, the vessel lies low in the water, gunwale under within a finger's breadth. In an hour they are at the opposite shore, though in their own boats they would hardly make the voyage in a night and day. When they reach the island, the vessel becomes empty, till it is so light that only the keel touches the waves. They see no man on the voyage, no man at the landing, but a voice is heard that proclaims the name and rank and parentage of each newly arrived passenger, or if women, those of their husbands. Traces of this remarkable legend seem to have survived, thirteen centuries later, in that endmost district of the Britannia of Procopius which still keeps the name of Bretagne. Near Raz, where the narrow promontory stretches westward into the ocean, is the 'Bay of Souls' (boé ann anavo); in the commune of Plouguel the corpse is taken to the churchyard, not by the shorter road by land, but in a boat by the 'Passage de l'Enfer,' across a little arm of the sea; and Breton folk-lore holds fast to the legend of the Curé de Braspar, whose dog leads over to Great Britain the souls of the departed, when the wheels of the soul-car are heard creaking in the air. These are but mutilated fragments, but they seem to piece together with another Keltic myth, told by Macpherson in the last century, the voyage of the boat of heroes to Flath-Innis, Noble Island, the green island home of the departed, which lies calm amid the storms far in the Western Ocean. With full reason, also, Mr. Wright traces to the situation of Ireland in the extreme West its especial association with legends of descents to the land of shades. Claudian placed at the extremity of Gaul the entrance where Ulysses found a way to Hades—

'Est locus extremum qua pandit Gallia litus, Oceani prætentus aquis, ubi fertur Ulysses,' &c.

No wonder that this spot should have been since identified with St. Patrick's Purgatory, and that some ingenious etymologist should have found in the name of 'Ulster' a corruption of 'Ulyssisterra,' and a commemoration of the hero's visit.[153]

Thirdly, the belief in a subterranean Hades peopled by the ghosts of the dead is quite common among the lower races. The earth is flat, say the Italmen of Kamchatka, for if it were round, people would fall off; it is the wrong side of another heaven, which covers another earth below, whither the dead will go down to their new life, and so, as Steller says, their mundane system is like a tub with three bottoms.[154] In North America, the Tacullis held that the soul goes after death into the bowels of the earth, whence it can come back in human shape to visit friends.[155] In South America, Brazilian souls travel down to the world below in the West, and Patagonian souls will depart to enjoy eternal drunkenness in the caves of their ancestral deities.[156] The New Zealander who says 'The sun has returned to Hades' (kua hoki mai te Ra ki te Rua), simply means that it has set. When a Samoan Islander dies, the host of spirits that surround the house, waiting to convey his soul away, set out with him crossing the land and swimming the sea, to the entrance of the spirit-world. This is at the westernmost point of the westernmost island, Savaii, and there one may see the two circular holes or basins where souls descend, chiefs by the bigger and plebeians by the smaller, into the regions of the under-world. There below is a heaven, earth, and sea, and people with real bodies, planting, fishing, cooking, as in the present life; but at night their bodies become like a confused collection of fiery sparks, and in this state during the hours of darkness they come up to revisit

their former abodes, retiring at dawn to the bush or to the lower regions.[157] For the state of thought on this subject among rude African tribes, it is enough to cite the Zulus, who at death will descend to live in Hades among their ancestors, the 'Abapansi,' the 'people underground.'[158] Among rude Asiatic tribes, such an example may be taken from the Karens. They are not quite agreed where Plu, the land of the dead, is situate; it may be above the earth or beyond the horizon. But the dominant and seemingly indigenous opinion is that it is below the earth. When the sun sets on earth, it rises in the Karen Hades, and when it sets in Hades it rises in this world. Here, again, the familiar belief of the European peasant is found; the spirits of the dead may come up from the land of shades by night, but at daybreak must return.[159]

Such ideas, developed by uncultured races, may be followed up in various detail, through the stage of religion represented by the Mexican and Peruvian nations,[160] into higher ranges of culture. The Roman Orcus was in the bowels of the earth, and when the 'lapis manalis,' the stone that closed the mouth of the world below, was moved away on certain solemn days, the ghosts of the dead came up to the world above, and partook of the offerings of their friends.[161] Among the Greeks, the Land of Hades was in the world below, nor was the thought unknown that it was the sunset realm of the Western god (πρ■ς ■σπ■ρου θεο■). What Hades seemed like to the popular mind, Lucian thus describes:—'The great crowd, indeed, whom the wise call "idiots," believing Homer and Hesiod, and the other myth-makers about these things, and setting up their poetry as a law, have supposed a certain deep place under the earth, Hades, and that it is vast, and roomy, and gloomy, and sunless, and how thought to be lighted up so as to behold every one within, I know not.'[162] In the ancient Egyptian doctrine of the future life, modelled on solar myth, the region of the departed combines the under-world and the west, Amenti; the dead passes the gate of the setting sun to traverse the roads of darkness, and behold his father Osiris; and with this solar thought the Egyptian priests, representing in symbolic ceremony the scenes of the other world, carried the corpse in the sacred boat across to the burial-place, on the western side of the sacred lake.[163] So, too, the cavernous Sheol of the Israelites, the shadowy region of departed souls, lay deep below the earth. Through the great Aryan religious systems, Brahmanism, Zarathustrism, Buddhism, and onward into the range of Islam and of Christianity, subterranean hells of purgatory or punishment make the doleful contrast to heavens of light and glory.

It is, however, a point worthy of special notice that the conception of hell as a fiery abyss, so familiar to the religions of the higher civilization, is all but unknown to savage thought, so much so that if met with, its genuineness is doubtful. Captain John Smith's 'History of Virginia,' published in 1624, contains two different accounts of the Indians' doctrine of a future life. Smith's own description is of a land beyond the mountains, toward sunset, where chiefs and medicine-men in paint and feathers shall smoke, and sing, and dance with their forefathers, while the common people have no life after death, but rot in their graves. Heriot's description is of tabernacles of the gods to which the good are taken up to perpetual happiness, while the wicked are carried to 'Popogusso,' a great pit which they think to be at the furthest parts of the world where the sun sets, and there burn continually.[164] Now knowing so much as we do of the religion of the Algonquins, to whom these Virginians belonged, we may judge that while the first account is genuinely native, though perhaps not quite correctly understood, the second was borrowed by the Indians from the white men themselves. Yet even here the touch of solar myth is manifest, and the description of the fiery abyss in the region of sunset may be compared with one from our own country, in the Anglo-Saxon dialogue of Saturn and Solomon. 'Saga me forhwan byth seo sunne read on æfen? Ic the secge, forthon heo locath on helle.—Tell me, why is the sun red at even? I tell thee, because she looketh on hell.'[165] To the same belief belongs another striking mythic feature. The idea of volcanos being mouths of the under-world seems not unexampled among the lower races, for we hear of certain New Zealanders casting their dead down into a crater.[166] But in connexion with the thought of a gehenna of fire and brimstone, Vesuvius, Etna, and Hecla had spiritual as well as material terrors to the mind of Christendom, for they were believed to be places of purgatory or the very mouths of the pit where the souls of the damned were cast down.[167] The Indians of Nicaragua used in old times to offer human sacrifices to their volcano Masaya, flinging the corpses into the crater, and in later years, after the conversion of the country, we hear of Christian confessors sending their penitents to climb the mountain, and (as a glimpse of hell) to look down upon the molten lava.[168]

Fourthly, in old times and new, it has come into men's minds to fix upon the sun and moon as abodes of departed souls. When we have learnt from the rude Natchez of the Mississippi and the Apalaches of Florida that the sun is the bright dwelling of departed chiefs and braves, and have traced like thoughts on into the theologies of Mexico and Peru, then we may compare these savage doctrines with Isaac Taylor's ingenious supposition in his 'Physical Theory of Another Life,'—the sun of each planetary system is the house of the higher and ultimate spiritual corporeity, and the centre of assembly to those who have passed on the planets their preliminary era of corruptible organization. Or perhaps some may prefer the Rev. Tobias Swinden's book, published in the last century, and translated into French and German, which proved the sun to be hell, and its dark spots gatherings of damned souls.[169] And when in South America the Saliva Indians have pointed out the moon, their paradise where no mosquitos are, and the Guaycurus have shown it as the home of chiefs and medicine-men deceased, and the Polynesians of Tokelau in like manner

have claimed it as the abode of departed kings and chiefs, then these pleasant fancies may be compared with Plutarch's description of the virtuous souls who after purification in the middle space gain their footing on the moon, and there are crowned as victors.[170] The converse notion of the moon as the seat of hell, has been elaborated in profoundest bathos by Mr. M. F. Tupper:

'I know thee well, O Moon, thou cavern'd realm, Sad Satellite, thou giant ash of death, Blot on God's firmament, pale home of crime, Scarr'd prison-house of sin, where damned souls Feed upon punishment. Oh, thought sublime, That amid night's black deeds, when evil prowls Through the broad world, thou, watching sinners well, Glarest o'er all, the wakeful eye of—Hell!'

Skin for skin, the brown savage is not ill matched in such speculative lore with the white philosopher.

Fifthly, as Paradise on the face of the earth, and Hades beneath it where the sun goes down, are regions whose existence is asserted or not denied by savage and barbaric science, so it is with Heaven. Among the examples which display for us the real course of knowledge among mankind, and the real relation which primitive bears to later culture, the belief in the existence of a firmament is one of the most instructive. It arises naturally in the minds of children still, and in accordance with the simplest childlike thought, the cosmologies of the North American Indians[171] and the South Sea Islanders[172] describe their flat earth arched over by the solid vault of heaven. Like thoughts are to be traced on through such details as the Zulu idea that the blue heaven is a rock encircling the earth, inside which are the sun, moon, and stars, and outside which dwell the people of heaven; the modern negro's belief that there is a firmament stretched above like a cloth or web; the Finnish poem which tells how Ilmarinen forged the firmament of finest steel, and set in it the moon and stars.[173] The New Zealander, with his notion of a solid firmament, through which the waters can be let down on earth through a crack or hole from the reservoir of rain above, could well explain the passage in Herodotus concerning that place in North Africa where, as the Libyans said, the sky is pierced, as well as the ancient Jewish conception of a firmament of heaven, 'strong as a molten mirror,' with its windows through which the rain pours down in deluge from the reservoirs above, windows which late Rabbinical literature tells us were made by taking out two stars.[174] In nations where the theory of the firmament prevails, accounts of bodily journeys or spiritual ascents to heaven are in general meant not as figure, but as fact. Among the lower races, the tendency to localize the region of departed souls above the sky seems less strong than that which leads them to place their world of the dead on or below the earth's surface. Yet some well-marked descriptions of a savage Heaven are on record, the following, and others to be cited presently. Even some Australians seem to think of going up to the clouds at death, to eat and drink, and hunt and fish as here.[175] In North America, the Winnebagos placed their paradise in the sky, where souls travel along that 'Path of the Dead' which we call the Milky Way; and working out the ever-recurring solar idea, the modern Iroquois speak of the soul going upward and westward, till it comes out on the beauteous plains of heaven, with people and trees and things as on earth.[176] In South America the Guarayos, representatives in some sort of the past condition of the Guarani race, worship Tamoi the Grandfather, the Ancient of Heaven; he was their first ancestor, who lived among them in old days and taught them to till the ground; then rising to heaven in the East he disappeared, having promised to be the helper of his people on earth, and to transport them, when they died, from the top of a sacred tree into another life, where they shall find their kindred and have hunting in plenty, and possess all that they possessed on earth; therefore it is that the Guarayos adorn their dead, and burn their weapons for them, and bury them with their faces to the East, whither they are to go.[177] Among American peoples whose culture rose to a higher level than that of these savage tribes, we hear of the Peruvian Heaven, the glorious 'Upper World,' and of the temporary abode of Aztec warriors on heavenly wooded plains, where the sun shines when it is night on earth, wherefore it was a Mexican saying that the sun goes at evening to lighten the dead.[178] What thoughts of heaven were in the minds of the old Aryan poets, this hymn from the Rig-Veda may show:—

'Where there is eternal light, in the world where the sun is placed, in that immortal imperishable world place me, O Soma! Where king Vaivasvata reigns, where the secret place of heaven is, where these mighty waters are, there make me immortal! Where life is free, in the third heaven of heavens, where the worlds are radiant, there make me immortal! Where wishes and desires are, where the place of the bright sun is, where there is freedom and delight, there make me immortal! Where there is happiness and delight, where joy and pleasure reside, where the desires of our desire are attained, there make me immortal!'[179]

In such bright vague thoughts from the poet's religion of nature, or in cosmic schemes of ancient astronomy, with their artificial glories of barbaric architecture exaggerated in the skies, or in the raptures of mystic vision, or in the calmer teaching of the theologic doctrine of a future life, descriptions of realms of blessed souls in heaven are to be followed through the religions of the Brahman, the Buddhist, the Parsi, the later Jew, the Moslem, and the Christian.

For the object, not of writing a handbook of religions, but of tracing the relation which the religion of savages bears to the religion of cultured nations, these details are enough to show the general line of human thought regarding the local habitations of departed

souls. It seems plain from the most cursory inspection of these various localizations, however much we may consider them as inherited or transmitted from people to people in the complex movements of theological history, that they are at any rate not derived from any single religion accepted among ancient or primæval men. They bear evident traces of independent working out in the varied definition of the region of souls, as on earth among men, on earth in some distant country, below the earth, above or beyond the sky. Similar ideas of this kind are found in different lands, but this similarity seems in large measure due to independent recurrence of thoughts so obvious. Not less is independent fancy compatible with the ever-recurring solar myth in such ideas, placing the land of Death in the land of Evening or of Night, and its entrance at the gates of Sunset. Barbaric poets of many a distant land must have gazed into the West to read the tale of Life and Death, and tell it of Man. If, however, we look more closely into the stages of intellectual history to which these theories of the Future World belong, it will appear that the assignment of the realm of departed souls to the three great regions, Earth, Hades, Heaven, has not been uniform. Firstly, the doctrine of a land of souls on Earth belongs widely and deeply to savage culture, but dwindles in the barbaric stage, and survives but feebly into the mediæval. Secondly, the doctrine of a subterranean Hades holds as large a place as this in savage belief, and has held it firmly along the course of higher religions, where, however, this under-world is looked on less and less as the proper abode of the dead, but rather as the dismal place of purgatory and hell. Lastly, the doctrine of a Heaven, floored upon a firmament, or placed in the upper air, seems in early savage belief less common than the other two, but yields to neither of them in its vigorous retention by the thought of modern nations. These local theories appear to be taken, firstly and mostly, in the most absolute literal sense, and although, under the influence of physical science, much that was once distinctly-meant philosophy has now passed among theologians into imagery and metaphor, yet at low levels of knowledge the new canons of interpretation find little acceptance, and even in modern Europe the rude cosmology of the lower races in no small measure retains its place.

Turning now to consider the state of the departed in these their new homes, we have to examine the definitions of the Future Life which prevail through the religions of mankind. In these doctrines there is much similarity caused by the spreading of established beliefs into new countries, and also much similarity that is beyond what such transmission can account for. So there is much variety due to local colour and circumstance, and also much variety beyond the reach of such explanation. The main causes of both similarity and variety seem to lie far deeper, in the very origin and inmost meaning of the doctrines. The details of the future life, among the lower races and upwards, are no heterogeneous mass of arbitrary fancies. Classified, they range themselves naturally round central ideas, in groups whose correspondence seems to indicate the special course of their development. Amongst the pictures into which this world has shaped its expectations of the next, two great conceptions are especially to be discerned. The one is that the future life is, as it were, a reflexion of this; in a new world, perhaps of dreamy beauty, perhaps of ghostly gloom, men are to retain their earthly forms and their earthly conditions, to have around them their earthly friends, to possess their earthly property, to carry on their earthly occupations. The other is that the future life is a compensation for this, where men's conditions are re-allotted as the consequence, and especially as the reward or punishment, of their earthly life. The first of these two ideas we may call (with Captain Burton) the 'continuance-theory,' contrasting with it the second as the 'retribution-theory.' Separately or combined, these two doctrines are the keys of the subject, and by grouping typical examples under their two headings, it will be possible to survey systematically man's most characteristic schemes of his life beyond the grave.

To the doctrine of Continuance belongs especially the savage view of the spirit-land, that it is as the dream-land where the souls of the living so often go to visit the souls of the dead. There the soul of the dead Karen, with the souls of his axe and cleaver, builds his house and cuts his rice; the shade of the Algonquin hunter hunts souls of beaver and elk, walking on the souls of his snow-shoes over the soul of the snow; the fur-wrapped Kamchadal drives his dog-sledge; the Zulu milks his cows and drives his cattle to kraal; South American tribes live on, whole or mutilated, healthy or sick, as they left this world, leading their old lives, and having their wives with them again, though indeed, as the Araucanians said, they have no more children, for they are but souls.[180] Soul-land is dream-land in its shadowy unreal pictures, for which, nevertheless, material reality so plainly furnished the models, and it is dream-land also in its vivid idealization of the soberer thoughts and feelings of waking life.

'There was a time when meadow, grove, and stream, The earth, and every common sight, To me did seem Apparell'd in celestial light, The glory and the freshness of a dream.'

Well might the Mohawk Indian describe the good land of paradise, as he had seen it in a dream. The shade of the Ojibwa follows a wide and beaten path that leads toward the West, he crosses a deep and rapid water, and reaching a country full of game and all things the Indian covets, he joins his kindred in their long lodge.[181] So, on the southern continent, the Bolivian Yuracarés will go, all of them, to a future life where there will be plenty of hunting, and Brazilian forest-tribes will find a pleasant forest full of calabash-trees and game, where the souls of the dead will live happily in company.[182] The Greenlanders hoped that their

souls—pale, soft, disembodied forms which the living could not grasp—would lead a life better than that of earth, and never ceasing. It might be in heaven, reached by the rainbow, where the souls pitch their tents round the great lake rich in fish and fowl, the lake whose waters above the firmament overflowing make rain on earth, and if its banks broke, there would be another deluge. But gaining the most and best of their living from the depths of the sea, they were also apt to think the land of Torngarsuk to be below the sea or earth, and to be entered by the deep holes in the rocks. Perpetual summer is there, ever beauteous sunshine, and no night, good water and superfluity of birds and fish, seals and reindeer to be caught without difficulty, or found alive seething in a great kettle.[183] In the Kimbunda country of South-West Africa, souls live on in 'Kalunga,' the world where it is day when it is night here; and with plenty of food and drink, and women to serve them, and hunting and dancing for pastime, they lead a life which seems a corrected edition of this.[184] On comparison of these pictures of the future life with such as have expressed the longings of more cultured nations, there appear indeed different details, but the principle is ever the same—the idealization of earthly good. The Norseman's ideal is sketched in the few broad touches which show him in Walhalla, where he and the other warriors without number ride forth arrayed each morning and hew each other on Odin's plain, till the slain have been 'chosen' as in earthly battle, and meal-tide comes, and slayers and slain mount and ride home to feast on the everlasting boar, and drink mead and ale with the Æsir.[185] To understand the Moslem's mind, we must read the two chapters of the Koran where the Prophet describes the faithful in the garden of delights, reclining on their couches of gold and gems, served by children ever young, with bowls of liquor whose fumes will not rise into the drinkers' heads, living among the thornless lotus-trees and date-palms loaded to the ground, feasting on the fruits they love and the meat of the rarest birds, with the houris near them with beautiful black eyes, like pearls in the shell, where no idle or wicked speech is heard, but only the words 'Peace, Peace.'

'They who fear the judgment of God shall have two gardens. Which of the benefits of God will ye deny? Adorned with groves. Which of the benefits of God will ye deny? In each of them shall spring two fountains. Which of the benefits of God will ye deny? In each of them shall grow two kinds of fruits. Which of the benefits of God will ye deny? They shall lie on carpets brocaded with silk and embroidered with gold; the fruits of the two gardens shall be near, easy to pluck. Which of the benefits of God will ye deny? There shall be young virgins with modest looks, unprofaned by man or jinn. Which of the benefits of God will ye deny? They are like jacinth and coral. Which of the benefits of God will ye deny? What is the recompence of good, if not good? Which of the benefits of God will ye deny?' &c.[186]

With these descriptions of Paradise idealized on secular life, it is interesting to compare others which bear the impress of a priestly caste, devising a heaven after their manner. We can almost see the faces of the Jewish rabbis settling their opinions about the high schools in the firmament of heaven, where Rabbi Simeon ben Yochai and the great Rabbi Eliezer teach Law and Talmud as they taught when they were here below, and masters and learners go prosing on with the weary old disputations of cross question and crooked answer that pleased their souls on earth.[187] Nor less suggestively do the Buddhist heavens reflect the minds of the ascetics who devised them. As in their thoughts sensual pleasure seemed poor and despicable in comparison with mystic inward joy, rising and rising till consciousness fades in trance, so, above their heavens of millions of years of mere divine happiness, they raised other ranges of heavens where sensual pain and pleasure cease, and enjoyment becomes intellectual, till at a higher grade even bodily form is gone, and after the last heaven of 'Neither-consciousness-nor-unconsciousness' there follows Nirwâna, as ecstasy passes into swoon.[188]

But the doctrine of the continuance of the soul's life has another and a gloomier side. There are conceptions of an abode of the dead characterized not so much by dreaminess as by ghostliness. The realm of shades, especially if it be a cavern underground, has seemed a dim and melancholy place to the dwellers in this 'white world,' as the Russian calls the land of the living. One description of the Hurons tells how the other world, with its hunting and fishing, its much-prized hatchets and robes and necklaces, is like this world, yet day and night the souls groan and lament.[189] Thus the region of Mictlan, the subterranean land of Hades whither the general mass of the Mexican nation, high and low, expected to descend from the natural death-bed, was an abode looked forward to with resignation, but scarcely with cheerfulness. At the funeral the survivors were bidden not to mourn too much, the dead was reminded that he had passed and suffered the labours of this life, transitory as when one warms himself in the sun, and he was bidden to have no care or anxiety to return to his kinsfolk now that he has departed for ever and aye, for his consolation must be that they too will end their labours, and go whither he has gone before.[190] Among the Basutos, where the belief in a future life in Hades is general, some imagine in this underworld valleys ever green, and herds of hornless speckled cattle owned by the dead; but it seems more generally thought that the shades wander about in silent calm, experiencing neither joy nor sorrow. Moral retribution there is none.[191] The Hades of the West African seems no ecstatic paradise, to judge by Captain Burton's description: 'It was said of the old Egyptians that they lived rather in Hades than upon the banks of the Nile. The Dahomans declare that this world is man's plantation, the next is his home,—a home which, however, no one visits of his own accord. They of course

own no future state of rewards and punishment: there the King will be a King, and the slave a slave for ever. Ku-to-men, or Deadman's land, the Dahoman's other but not better world, is a country of ghosts, of umbræ, who, like the spirits of the nineteenth century in Europe, lead a quiet life, except when by means of mediums they are drawn into the drawing-rooms of the living.' With some such hopeless expectation the neighbours of the Dahomans, the Yorubas, judge the life to come in their simple proverb that 'A corner in this world is better than a corner in the world of spirits.'[192] The Finns, who feared the ghosts of the departed as unkind, harmful beings, fancied them dwelling with their bodies in the grave, or else, with what Castrén thinks a later philosophy, assigned them their dwelling in the subterranean Tuonela. Tuonela was like this upper earth, the sun shone there, there was no lack of land and water, wood and field, tilth and meadow, there were bears and wolves, snakes and pike, but all things were of a hurtful, dismal kind, the woods dark and swarming with wild beasts, the water black, the cornfields bearing seed of snakes' teeth, and there stern pitiless old Tuoni, and his grim wife and son with the hooked fingers with iron points, kept watch and ward over the dead lest they should escape.[193] Scarce less dismal was the classic ideal of the dark realm below, whither the shades of the dead must go to join the many gone before (■ς πλε■νων ■κ■σθαι; penetrare ad plures; andare tra i più). The Roman Orcus holds the pallid souls, rapacious Orcus, sparing neither good nor bad. Gloomy is the Greek land of Hades, dark dwelling of the images of departed mortals, where the shades carry at once their living features and their dying wounds, and glide and cluster and whisper, and lead the shadow of a life. Like the savage hunter on his ghostly prairie, the great Orion still bears his brazen mace, still chases over the meadows of asphodel the flying beasts he slew of yore in the lonely mountains. Like the rude African of to-day, the swift-footed Achilles scorns such poor, thin, shadowy life; rather would he serve a mean man upon earth than be lord of all the dead.

'Truly, oxen and goodly sheep may be taken for booty, Tripods, too, may be bought, and the yellow beauty of horses; But from the fence of the teeth when once the soul is departed, Never cometh it back, regained by plunder or purchase.'[194]

Where and what was Sheol, the dwelling of the ancient Jewish dead? Of late years the Biblical critic has no longer to depend on passages of the Old Testament for realizing its conception, so plainly is it connected with the seven-circled Irkalla of the Babylonian-Assyrian religion, the gloomy subterranean abode whence there is no return for man, though indeed the goddess Isthar passed through its seven gates, and came back to earth from her errand of saving all life from destruction. In the history of religions, few passages are more instructive than those in which the prophets of the Old Testament recognize the ancestral connexion of their own belief with the national religions of Babylon-Assyria, as united in the doctrine of a gloomy prison of ghosts, through whose gates Jew and Gentile alike must pass. Sheol (■■■■ from ■■■) is, as its name implies, a cavernous recess, yet it is no mere surface-grave or tomb, but an under-world of awful depth: 'High as Heaven, what doest thou? deeper than Sheol, what knowest thou?' Asshur and all her company, Elam and all her multitude, the mighty fallen of the uncircumcised, lie there. The great king of Babylon must go down:—

'Sheol from beneath is moved because of thee, to meet thee at thy coming: He rouseth for thee the mighty dead, all the great chiefs of the earth; He maketh to rise up from their thrones, all the kings of the nations. All of them shall accost thee, and shall say unto thee: Art thou, even thou too, became weak as we? Art thou made like unto us?'

To the Greek Septuagint, _Sheol_ was _Hades_, and for this the Coptic translators had their long-inherited Egyptian name of _Amenti_, while the Vulgate renders it as _Infernus_, the lower regions. The Gothic Ulfilas, translating the Hades of the New Testament, could use _Halja_ in its old German sense of the dim shadowy home of the dead below the earth; and the corresponding word _Hell_, if this its earlier sense be borne in mind, fairly translates Sheol and Hades in the English version of the Old and New Testament, though the word has become misleading to uneducated ears by being used also in the sense of Gehenna, the place of torment. The early Hebrew historians and prophets, holding out neither the hope of everlasting glory nor the fear of everlasting agony as guiding motives for man's present life, lay down little direct doctrine of a future state, yet their incidental mentions justify the translators who regard Sheol as Hades. Sheol is a special locality where dead men go to their dead ancestors: 'And Isaac gave up the ghost, and died, and was gathered unto his people ... and his sons Esau and Jacob buried him.' Abraham, though not even buried in the land of his forefathers, is thus 'gathered unto his people;' and Jacob has no thought of his body being laid with Joseph's body, torn by wild beasts in the wilderness, when he says, 'I shall go down to my son mourning to Sheol ('ε■ς ■δου' in the LXX., 'èpesët èàmenti' in the Coptic, 'in infernum' in the Vulgate). The rephaim, the 'shades' of the dead, who dwell in Sheol, love not to be disturbed from their rest by the necromancer; 'And Samuel said to Saul, why hast thou disquieted me to bring me up?' Yet their quiet is contrasted in a tone of sadness with the life on earth; 'Whatsoever thy hand findeth to do, do it with thy might; for there is no work, nor device, nor knowledge, nor wisdom, in Sheol, whither thou goest.'[195] Such thoughts of the life of the shades below did not disappear when, in the later years of the Jewish nation, the great change in the doctrine of the future life

passed in so large a measure over the Hebrew mind, their earlier thoughts of ghostly continuance giving place to the doctrines of resurrection and retribution. The ancient ideas have even held their place on into Christian thought, in pictures like that of the Limbus Patrum, the Hades where Christ descended to set free the patriarchs.

The Retribution-theory of the future life comprises in a general way the belief in different grades of future happiness, especially in different regions of the other world allotted to men according to their lives in this. This doctrine of retribution is, as we have already seen, far from universal among mankind, many races recognizing the idea of a spirit outliving the body, without considering the fate of this spirit to depend at all upon the conduct of the living man. The doctrine of retribution indeed hardly seems an original part of the doctrine of the future life. On the contrary, if we judge that men in a primitive state of culture arrived at the notion of a surviving spirit, and that some races, but by no means all, afterwards reached the further stage of recognizing a retribution for deeds done in the body, this theory will not, so far as I know, be discountenanced by facts.[196] Even among the higher savages, however, a connexion between man's life and his happiness or misery after death is often held as a definite article of theology, and thence it is to be traced onward through barbaric religions, and into the very heart of Christianity. Yet the grounds of good and evil in the future life are so far from uniform among the religions of the world, that they may differ widely within what is considered one and the same creed. The result is more definite than the cause, the end than the means. Men who alike look forward to a region of unearthly happiness beyond the grave, hope to reach that happy land by roads so strangely different, that the path of life which leads one nation to eternal bliss may seem to the next the very descent into the pit. In noticing among savage and barbaric peoples the qualifications which determine future happiness, we may with some distinctness define these as being excellence, valour, social rank, religious ordinance. On the whole, however, in the religions of the lower range of culture, unless where they may have been affected by contact with higher religions, the destiny of the man after death seems hardly to turn on judicial reward or punishment for his moral conduct in life. Such difference as is made between the future conditions of different classes of souls, seems more often to belong to a remarkable intermediate doctrine, standing between the earlier continuance-theory and the later retribution-theory. The idea of the next life being similar to this seems to have developed into the idea that what gives prosperity and renown here will give it also there, so that earthly conditions carry on their contrasts into the changed world after death. Thus a man's condition after death will be a result of, rather than a compensation or retribution for, his condition during life. A comparison of doctrines held at various stages of culture may justify a tentative speculation as to their actual sequence in history, favouring the opinion that through such an intermediate stage the doctrine of simple future existence was actually developed into the doctrine of future reward and punishment, a transition which for deep import to human life has scarcely its rival in the history of religion.

The effect of earthly rank on the future life, as looked at by the lower races, brings out this intermediate stage in bold relief. Mere transfer from one life to another makes chiefs and slaves here chiefs and slaves hereafter, and this natural doctrine is very usual. But there are cases in which earthly caste is exaggerated into utter difference in the life to come. The aerial paradise of Raiatea, with its fragrant ever-blooming flowers, its throngs of youths and girls all perfection, its luxurious feasts and merrymakings, were for the privileged orders of Areois and chiefs who could pay the priests their heavy charges, but hardly for the common populace. This idea reached its height in the Tonga islands, where aristocratic souls would pass to take their earthly rank and station in the island paradise of Bolotu, while plebeian souls, if indeed they existed, would die with the plebeian bodies they dwelt in.[197] In Vancouver's Island, the Ahts fancied Quawteaht's calm sunny plenteous land in the sky as the resting-place of high chiefs, who live in one great house as the Creator's guests, while the slain in battle have another to themselves. But otherwise all Indians of low degree go deep down under the earth to the land of Chay-her, with its poor houses and no salmon and small deer, and blankets so small and thin that when the dead are buried the friends often bury blankets with them, to send them to the world below with the departed soul.[198] The expectation of royal dignity in the life after death, distinct from the fate of ordinary mortals, comes well into view among the Natchez of Louisiana, where the sun-descended royal family would in some way return to the Sun; thus also in the mightier empire of Peru, where each sun-descended Inca, feeling the approach of death, announced to his assembled vassals that he was called to heaven to rest with his father the Sun.[199] But in the higher religions, the change in this respect from the doctrine of continuance to the doctrine of retribution is wonderful in its completeness. The story of that great lady who strengthened her hopes of future happiness by the assurance, 'They will think twice before they refuse a person of my condition,' is a mere jest to modern ears. Yet, like many other modern jest, it is only an archaism which in an older stage of culture had in it nothing ridiculous.

To the happy land of Torngarsuk the Great Spirit, says Cranz, only such Greenlanders came as have been valiant workers, for other ideas of virtue they have none; such as have done great deeds, taken many whales and seals, borne much hardship, been drowned at sea, or died in childbirth.[200] Thus Charlevoix says of the Indians further south, that their claim to hunt after death on the prairies of eternal spring is to have been good hunters and warriors here. Lescarbot, speaking of the belief among the Indians of Virginia that after death the good will be at rest and the wicked in pain, remarks that their enemies are the wicked and

themselves the good, so that in their opinion they are after death much at their ease, and principally when they have well defended their country and slain their enemies.[201] So Jean de Lery said of the rude Tubinambas of Brazil, that they think the souls of such as have lived virtuously, that is to say, who have well avenged themselves and eaten many of their enemies, will go behind the great mountains and dance in beautiful gardens with the souls of their fathers, but the souls of the effeminate and worthless, who have not striven to defend their country, will go to Aygnan the Evil Spirit, to incessant torments.[202] More characteristic and probably more genuinely native than most of these expectations, is that of the Caribs, that the braves of their nation should go after death to happy islands, where all good fruits grow wild, there to spend their time in dancing and feasting, and to have their enemies the Arawaks for slaves; but the cowards who feared to go to war should go to serve the Arawaks, dwelling in their waste and barren lands beyond the mountains.[203]

The fate of warriors slain in battle is the subject of two singularly contrasted theories. We have elsewhere examined the deep-lying belief that if a man's body be wounded or mutilated, his soul will arrive in the same state in the other world. Perhaps it is some such idea of the soul being injured with the body by a violent death, that leads the Mintira of the Malay Peninsula, though not believing in a future reward and punishment, to exclude from the happy paradise of 'Fruit Island' (Pulo Bua) the souls of such as die a bloody death, condemning them to dwell on 'Red Land' (Tana Mera), a desolate barren place, whence they must even go to the fortunate island to fetch their food.[204] In North America, the idea is mentioned among the Hurons that the souls of the slain in war live in a band apart, neither they nor suicides being admitted to the spirit-villages of their tribe. A belief ascribed to certain Indians of California may be cited here, though less as a sample of real native doctrine than to illustrate that borrowing of Christian ideas which so often spoils such evidence for ethnological purposes. They held, it is said, that Niparaya, the Great Spirit, hates war, and will have no warriors in his paradise, but that his adversary Wac, shut up for rebellion in a great cave, takes thither to himself the slain in battle.[205] On the other hand, the thought which shows out in such bold relief in the savage mind, that courage is virtue, and battle and bloodshed the hero's noblest pursuit, leads naturally to a hope of glory for his soul when his body has been slain in fight. Such expectation was not strange in North America, to that Indian tribe, for instance, who talked of the Great Spirit walking in the moonlight on his island in Lake Superior, whither slain warriors will go to him to take their pleasure in the chace.[206] The Nicaraguans declared that men who died in their houses went underground, but the slain in war went to serve the gods in the east, where the sun comes from. This corresponds in part with a remarkable threefold contrast of the future life among their Aztec kinsfolk. Mictlan, the Hades of the general dead, and Tlalocan, the Earthly Paradise, reached by certain special and acute ways of death, have been mentioned here already. But the souls of warriors slain in battle or sacrificed as captives, and of women who died in child-birth, were transported to the heavenly plains; there the heroes, peeping through the holes in their bucklers pierced by arrows in earthly fight, watched the Sun arise and saluted him with shout and clash of arms, and at noon the mothers received him with music and dance to escort him on his western way.[207] In such wise, to the old Norseman, to die the 'straw-death' of sickness or old age was to go down into the dismal loathly house of Hela the Death-goddess; if the warrior's fate on the field of battle were denied him, and death came to fetch him from a peaceful couch, yet at least he could have the scratch of the spear, Odin's mark, and so contrive to go with a blood-stained soul to the glorious Walhalla. Surely then if ever, says a modern writer, the kingdom of heaven suffered violence, and the violent took it by force.[208] Thence we follow the idea onward to the battle-fields of holy war, where the soldier earned with his blood the unfading crown of martyrdom, and Christian and Moslem were urged in mutual onset and upheld in agony by the glimpse of paradise opening to receive the slayer of the infidel.

Such ideas, current among the lower races as to the soul's future happiness or misery, do not seem, setting aside some exceptional points, to be thoughts adopted or degraded from doctrines of cultured nations. They rather belong to the intellectual stratum in which they are found. If so, we must neither ignore nor exaggerate their standing in the lower ethics. 'The good are good warriors and hunters,' said a Pawnee chief; whereupon the author who mentions the saying remarks that this would also be the opinion of a wolf, if he could express it.[209] Nevertheless, if experience has led societies of savage men to fix on certain qualities, such as courage, skill, and industry, as being virtues, then many moralists will say that such a theory is not only ethical, but lying at the very foundation of ethics. And if these savage societies further conclude that such virtues obtain their reward in another world as in this, then their theories of future happiness and misery, destined for what they call good and bad men, may be looked on in this sense as belonging to morality, though at no high stage of development. But many or most writers, when they mention morality, assume a narrower definition of it. This must be borne in mind in appreciating what is meant by the statements of several well-qualified ethnologists, who have, in more or less degree, denied a moral character to the future retribution as conceived in savage religion. Mr. Ellis, describing the Society Islanders, at least gives an explicit definition. When he tried to ascertain whether they connected a person's condition in a future state with his disposition and conduct in this, he never could learn that they expected in the world of spirits any difference in the treatment of a kind, generous, peaceful man, and that of a cruel, parsimonious,

quarrelsome one.[210] This remark, it seems to me, applies to savage religion far and wide. Dr. Brinton, commenting on the native religions of America, draws his line in a somewhat different place. Nowhere, he says, was any well-defined doctrine that moral turpitude was judged and punished in the next world. No contrast is discoverable between a place of torments and a realm of joy; at the worst but a negative castigation awaited the liar, the coward, or the niggard.[211] Professor J. G. Müller, in his 'American Religions,' yet more pointedly denies any 'ethical meaning' in the contrasts of the savage future life, and looks upon what he well calls its 'light-side' and 'shadow-side' not as recompensing earthly virtue and vice, but rather as carrying on earthly conditions in a new existence.[212]

The idea that admission to the happier region depends on the performance of religious rites and the giving of offerings, seems scarcely known to the lowest savages. It is worth while, however, to notice some statements which seem to mark its appearance at the level of high savagery or low barbarism. Thus in the Society Islands, though the destiny of man's spirit to the region of night or to elysium was irrespective of moral character, we hear of neglect of rites and offerings as being visited by the displeasure of deities.[213] In Florida, the belief of the Sun-worshipping people of Achalaque was thus described: those who had lived well, and well served the Sun, and given many gifts to the poor in his honour, would be happy after death and be changed into stars, whereas the wicked would be carried to a destitute and wretched existence among mountain precipices, where fierce wild beasts have their dens.[214] According to Bosman, the souls of Guinea negroes reaching the river of death must answer to the divine judge how they have lived; have they religiously observed the holy days dedicated to their god, have they abstained from all forbidden meats and kept their vows inviolate, they are wafted across to paradise; but if they have sinned against these laws they are plunged in the river and there drowned for ever.[215] Such statements among peoples at these stages of culture are not frequent, and perhaps not very valid as accounts of original native doctrine. It is in the elaborate religious systems of more organized nations, in modern Brahmanism and Buddhism, and degraded forms of Christianity, that the special adaptation of the doctrine of retribution to the purposes of priestcraft and ceremonialism has become a commonplace of missionary reports.

It is well not to speak too positively on a subject so difficult and doubtful as this of the history of the belief in future retribution. Careful criticism of the evidence is above all necessary. For instance, we have to deal with several statements recorded among low races, explicitly assigning reward or punishment to men after death, according as they were good or bad in life. Here the first thing to be done is to clear up, if possible, the question whether the doctrine of retribution may have been borrowed from some more cultured neighbouring religion, as the very details often show to have been the case. Examples of direct adoption of foreign dogmas on this subject are not uncommon in the world. When among the Dayaks of Borneo it is said that a dead man becomes a spirit and lives in the jungle, or haunts the place of burial or burning, or when some distant mountain-top is pointed to as the abode of spirits of departed friends, it is hardly needful to question the originality of ideas so characteristically savage. But one of these Dayak tribes, burning the dead, says that 'as the smoke of the funeral pile of a good man rises, the soul ascends with it to the sky, and that the smoke from the pile of a wicked man descends, and his soul with it is borne down to the earth, and through it to the regions below.'[216] Did not this exceptional idea come into the Dayak's mind by contact with Hinduism? In Orissa, again, Khond souls have to leap across the black unfathomable river to gain a footing on the slippery Leaping Rock, where Dinga Pennu, the judge of the dead, sits writing his register of all men's daily lives and actions, sending virtuous souls to become blessed spirits, keeping back wicked ones and sending them to suffer their penalties in new births on earth.[217] Here the striking myth of the leaping rock is perfectly savage, but the ideas of a judgment, moral retribution, and transmigration, may have come from the Hindus of the plains, as the accompanying notion of the written book unquestionably did. Dr. Mason is no doubt right in taking as the indigenous doctrine of the Karens their notion of an under-world where the ghosts of the dead live on as here, while he sets down to Hindu influence the idea of Tha-ma, the judge of the dead (the Hindu Yama), as allotting their fate according to their lives, sending those who have done deeds of merit to heaven, those who have done wickedness to hell, and keeping in Hades the neither good nor bad.[218] How the theory of moral retribution may be superposed on more primitive doctrines of the future life, comes remarkably into view in Turanian religion. Among the Lapps, Jabme-Aimo, the subterranean 'home of the dead' below the earth, where the departed have their cattle and follow their livelihood like Lapps above, though they are richer, wiser, stronger folk, and also Saivo-Aimo, a yet happier 'home of the gods,' are conceptions thoroughly in the spirit of the lower culture. But in one account the subterranean abode becomes a place of transition, where the dead stay awhile, and then with bodies renewed are taken up to the Heaven-god, or if misdoers, are flung into the abyss. Castrén is evidently right in rejecting this doctrine as not native, but due to Catholic influence. So, at the end of the 16th Rune of the Finnish Kalewala, which tells of Wainamoinen's visit to the dismal land of the dead, there is put into the hero's mouth a second speech, warning the children of men to harm not the innocent, for sad payment is in Tuoni's dwelling—the bed of evil-doers is there, with its glowing red-hot stones below and its canopy of snakes above. But the same critic condemns this moral 'tag,' as a later addition to the genuine heathen picture of Manala, the under-world of the dead.[219] Nor did

Christianity scorn to borrow details from the religions it abolished. The narrative of a mediæval visit to the other world would be incomplete without its description of the awful Bridge of Death; Acheron and Charon's bark were restored to their places in Tartarus by the visionary and the poet; the wailing of sinful souls might be heard as they were hammered white-hot in Vulcan's smithies; and the weighing of good and wicked souls, as we may see it figured on every Egyptian mummy-case, now passed into the charge of St. Paul and the Devil.[220]

The foregoing considerations having been duly weighed, it remains to call attention to the final problem, at what state of religious history the full theological doctrine of judicial retribution and moral compensation in a future life may have arisen. It is hard, however, to define where this development takes place even at a barbaric stage of culture. Thus among the barbaric nations of West Africa, there appear such beliefs as that in Nuffi, that criminals who escape their punishment here will receive it in the other world; the division of the Yoruba under-world into an upper and a lower region for the righteous and wicked; the Kru doctrine that only the good will rejoin their ancestors in heaven; the Oji doctrine that only the good will dwell after death in the heavenly house or city of the Deity whom they call the 'Highest.'[221] How far is all this to be taken as native conception, and how far as due to ages of Christian and Moslem intercourse, to which at any rate few will scruple to refer the last case?

In the lower ranges of civilization, some of the most remarkable doctrines of this class are recorded in North America. Thus they appear in connexion with the fancy of a river or gulf to be passed by the departing soul on its way to the land of the dead, one of the most remarkable traits of the mythology of the world. This seems in its origin a nature-myth, connected probably with the Sun's passage across the sea into Hades, and in many of its versions it appears as a mere episode of the soul's journey without any moral sense attached to it. Brebeuf, the same early Jesuit missionary who says explicitly of the Hurons that there is no difference in their future life between the fate of the virtuous and the vicious, mentions also among them the tree-trunk that bridges the river of death; here the dead must cross, the dog that guards it attacks some souls, and they fall. Yet in other versions this myth has a moral sense attached to it, and the passage of the heaven-gulf becomes an ordeal to separate good and wicked. To take but one instance, there is Catlin's account of the Choctaw souls journeying far westward, to whom the long slippery barkless pine-log, stretching from hill to hill, bridges over the deep and dreadful river; the good pass safely to a beauteous Indian paradise, the wicked fall into the abyss of waters, and go the dark hungry wretched land where they are henceforth to dwell.[222] This and many similar beliefs current in the religions of the world, which need not be particularised here, seem best explained as originally nature-myths, afterwards adapted to a religious purpose. A different conception was recorded so early as 1623, by Captain John Smith among the Massachusetts, whose name is still borne by the New England district they once inhabited: They say, at first there was no king but Kiehtan, that dwelleth far westerly above the heavens, whither all good men go when they die, and have plenty of all things. The bad men go thither also and knock at the door, but he bids them go wander in endless want and misery, for they shall not stay there.[223] Lastly, the Salish Indians of Oregon say that the good go to a happy hunting-ground of endless game, while the bad go to a place where there is eternal snow, hunger, and thirst, and are tantalised by the sight of game they cannot kill, and water they cannot drink.[224] If, now, in looking at these records, the doubts which beset them can be put aside, and the accounts of the different fates assigned to the good and wicked can be accepted as belonging to genuine native American religion and if, moreover, it be considered that the goodness and wickedness for which men are to be thus rewarded and punished are moral qualities, however undeveloped in definition, this will amount to an admission that the doctrine of moral retribution at any rate appears within the range of savage theology. Such a view, however, by no means invalidates the view here put forward as to the historical development of the doctrine, but only goes to prove at how early a stage it may have begun to take place. The general mass of evidence still remains to show the savage doctrine of the future state, as originally involving no moral retribution, or arriving at this through transitional and rudimentary stages.

In strong contrast with the schemes of savage future existence, I need but set before the reader's mind a salient point here and there in the doctrine of distinct and unquestionable moral retribution, as held in religions of the higher culture. The inner mystic doctrines of ancient Egypt may perhaps never be extracted now from the pictures and hieroglyphic formulas of the 'Book of the Dead.' But the ethnographer may satisfy himself of two important points as to the place which the Egyptian view of the future life occupies in the history of religion. On the one hand, the soul's quitting and revisiting the corpse, the placing of the image in the tomb, the offering of meat and drink, the fearful journey to the regions of the departed, the renewed life like that on earth, with its houses to dwell in and fields to cultivate—all these are conceptions which connect the Egyptian religion with the religions of the ruder races of mankind. But on the other hand, the mixed ethical and ceremonial standard by which the dead are to be judged adapts these primitive and even savage thoughts to a higher social development, such as may be shown by fragments from that remarkable 'negative confession' which the dead must make before Osiris and the forty-two judges in Amenti. 'O ye Lords of Truth! let me know you!... Rub ye away my faults. I have not privily done evil against mankind.... I have not told falsehoods in the tribunal

of Truth.... I have not done any wicked thing. I have not made the labouring man do more than his task daily.... I have not calumniated the slave to his master.... I have not murdered.... I have not done fraud to men. I have not changed measures of the country. I have not injured the images of the gods. I have not taken scraps of the bandages of the dead. I have not committed adultery. I have not withheld milk from the mouths of sucklings. I have not hunted wild animals in the pasturages. I have not netted sacred birds.... I am pure! I am pure! I am pure!'[225]

The Vedic hymns, again, tell of endless happiness for the good in heaven with the gods, and speak also of the deep pit where the liars, the lawless, they who give no sacrifice, will be cast.[226] The rival theories of continuance and retribution are seen in instructive coexistence in classic Greece and Rome. What seems the older belief holds its ground in the realm of Hades; that dim region of bodiless, smoke-like ghosts remains the home of the undistinguished crowd in the μ■σος β■ος, the 'middle life.' Yet at the same time the judgment-seat of Minos and Rhadamanthos, the joys of Elysium for the just and good, fiery Tartarus echoing with the wail of the wicked, represent the newer doctrine of a moral retribution. The idea of purgatorial suffering, which hardly seems to have entered the minds of the lower races, expands in immense vigour in the great Aryan religions of Asia. In Brahmanism and Buddhism, the working out of good and evil actions into their necessary consequence of happiness and misery is the very key to the philosophy of life, whether life's successive transmigrations be in animal, or human, or demon births on earth, or in luxurious heaven-palaces of gold and jewels, or in the agonizing hells where Oriental fancy riots in the hideous inventory of torture—caldrons of boiling oil and liquid fire; black dungeons and rivers of filth; vipers, and vultures, and cannibals; thorns, and spears, and red-hot pincers, and whips of flame. To the modern Hindu, it is true, ceremonial morality seems to take the upper hand, and the question of happiness or misery after death turns rather on ablutions and fasts, on sacrifices and gifts to brahmans, than on purity and beneficence of life. Buddhism in South East Asia, sadly degenerate from its once high estate, is apt to work out the doctrine of merit and demerit into debtor and creditor accounts kept in good and bad marks from day to day; to serve out so much tea in hot weather counts 1 to the merit-side, and putting a stop to one's women scolding for a month counts 1 likewise, but this may be balanced by the offence of letting them keep the bowls and plates dirty for a day, which counts 1 the wrong way; and it appears that giving wood for two coffins, which count 30 marks each, and burying four bones, at 10 marks a-piece, would just be balanced by murdering a child, which counts 100 to the bad.[227] It need hardly be said here that these two great religions of Asia must be judged rather in their records of long past ages, than in the lingering degeneration of their modern reality.

In the Khordah-Avesta, a document of the old Persian religion, the fate of good and wicked souls at death is pictured in a dialogue between Zarathustra (Zoroaster), and Ahura-Mazda and Anra-Mainyu (Ormuzd and Ahriman). Zarathustra asks,'Ahura-Mazda, Heavenly, Holiest, Creator of the corporeal world, Pure! When a pure man dies, where does his soul dwell during this night?' Then answers Ahura-Mazda: 'Near his head it sits down, reciting the Gâthâ Ustavaiti, praying happiness for itself; "Happiness be to the man who conduces to the happiness of each. May Ahura-Mazda create, ruling after his wish."' On this night the soul sees as much joyfulness as the whole living world possesses; and so the second and the third night. When the lapse of the third night turns itself to light, then the soul of the pure man goes forward, recollecting itself by the perfume of plants. A wind blows to meet it from the mid-day regions, a sweet-scented one, more sweet-scented than the other winds, and the soul of the pure man receives it—'Whence blows this wind, the sweetest-scented which I ever have smelt with the nose?' Then comes to meet him his own law (his rule of life) in the figure of a maiden beautiful, shining, with shining arms, powerful, well-grown, slender, large-bosomed, with praiseworthy body, noble, with brilliant face, one of fifteen years, as fair in her growth as the fairest creatures. Then to her speaks the soul of the pure man, asking, 'What maiden art thou whom I have seen here as the fairest of maidens in body?' She answers, 'I am, O youth, thy good thoughts, words, and works, thy good law, the own law of thine own body. Thou hast made the pleasant yet pleasanter to me, the fair yet fairer, the desirable yet more desirable, the sitting in a high place sitting in a yet higher place.' Then the soul of the pure man takes the first step and comes to the first paradise, the second and third step to the second and third paradise, the fourth step and arrives at the Eternal Lights. To the soul speaks a pure one deceased before, asking it, 'How art thou, O pure deceased, come away from the fleshly dwellings, from the corporeal world hither to the invisible, from the perishable world hither to the imperishable. Hail! has it happened to thee long?' 'Then speaks Ahura-Mazda: "Ask not him whom thou askest, for he is come on the fearful way of trembling, the separation of body and soul. Bring him hither of the food, of the full fatness, that is the food for a youth who thinks, speaks, and does good, who is devoted to the good law after death—that is the food for a woman who especially thinks good, speaks good, does good, the following, obedient, pure after death."' And now Zarathustra asks, when a wicked one dies, where his soul dwells? He is told how, running about near the head, it utters the prayer, Ke maúm:—'Which land shall I praise, whither shall I go praying, O Ahura-Mazda?' In this night it sees as much unjoyfulness as the whole living world; and so the second and the third night, and it goes at dawn to the impure place, recollecting itself by the stench. An evil-smelling wind comes towards the dead from the north, and with it the ugly hateful maiden who is his own wicked deeds, and the soul takes the

fourth step into the darkness without beginning, and a wicked soul asks how long—woe to thee!—art thou come? and the mocking Anra-Mainyu, answering in words like the words of Ahura-Mazda to the good, bids food to be brought—poison, and mixed with poison, for them who think and speak and do evil, and follow the wicked law. The Parsi of our own time, following in obscure tradition the ancient Zoroastrian faith, before he prays for forgiveness for all that he ought to have thought, and said, and done, and has not, for all that he ought not to have thought, and said, and done, and has, confesses thus his faith of the future life:—'I am wholly without doubt in the existence of the good Mazadayaçnian faith, in the coming of the resurrection and the later body, in the stepping over the bridge Chinvat, in an invariable recompense of good deeds and their reward, and of bad deeds and their punishment.'[228]

In Jewish theology, the doctrine of future retribution appears after the Babylonish captivity, not in ambiguous terms, but as the strongly-expressed and intensely-felt religious conviction it has since remained among the children of Israel. Not long afterward, it received the sanction of Christianity.

A broad survey of the doctrine of the Future Life among the various nations of the world shows at once how difficult and how important is a systematic theory of its development. Looked at ethnographically, the general relations of the lower to the higher culture as to the belief in future existence may be defined somewhat as follows:—If we draw a line dividing civilization at the junction of savagery and barbarism—about where the Carib and New Zealander ends and the Aztec or Tatar begins, we may see clearly the difference of prevalent doctrine on either side. On the savage side, the theory of hovering ghosts is strong, rebirth in human or animal bodies is often thought of, but above all there prevails the expectation of a new life, most often located in some distant earthly region, or less commonly in the under-world or on the sky. On the cultured side, the theory of hovering ghosts continues, but tends to subside from philosophy into folklore, the theory of re-birth is elaborated into great philosophic systems, but eventually dies out under the opposition of scientific biology, while the doctrine of a new life after death maintains its place with immense power in the human mind, although the dead have been ousted by geography from any earthly district, and the regions of heaven and hell are more and more spiritualized out of definite locality into vague expressions of future happiness and misery. Again, on the savage side we find the dominant idea to be a continuance of the soul in a new existence, like the present life, or idealized and exaggerated on its model; while on the cultured side the doctrine of judgment and moral retribution prevails with paramount, though not indeed absolute sway. What, then, has been the historical course of theological opinion, to have produced in different stages of culture these contrasted phases of doctrine?

In some respects, theories deriving savage from more civilized ideas are tenable. In certain cases, to consider a particular savage doctrine of the future state as a fragmentary, or changed, or corrupted outcome of the religion of higher races, seems as easy as to reverse this view by taking savagery as representing the starting-point. It is open to anyone to suppose that the doctrine of transmigration among American savages and African barbarians may have been degraded from elaborate systems of metempsychosis established among philosophic nations like the Hindus; that the North American and South African doctrine of continued existence in a subterranean world may be derived from similar beliefs held by races at the level of the ancient Greeks; that when rude tribes in the Old or New World assign among the dead a life of happiness to some, and of misery to others, this idea may have been inherited or adopted from cultured nations holding more strongly and systematically the doctrine of retribution. In such cases the argument is to a great extent the same, whether the lower race be considered degenerate descendants of a higher nation, or whether the simpler supposition be put forward that they have adopted the ideas of some more cultured people. These views ought to have full attention, for degenerate and borrowed beliefs form no small item in the opinions of uncivilized races. Yet this kind of explanation is more adapted to meet special cases than general conditions; it is rather suited to piecemeal treatment, than to comprehensive study, of the religions of mankind. Worked out on a large scale, it would endeavour to account for the doctrines of the savage world, as being a patchwork of fragments from various religions of high nations, transported by not easily-conceived means from their distant homes and set down in remote regions of the earth. It may be safely said that no hypothesis can account for the varied doctrines current among the lower tribes, without the admission that religious ideas have been in no small measure developed and modified in the districts where they are current.

Now this theory of development, in its fullest scope, combined with an accessory theory of degeneration and adoption, seems best to meet the general facts of the case. A hypothesis which finds the origin of the doctrine of the future life in the primitive animism of the lower races, and thence traces it along the course of religious thought, in varied developments fitted to exacter knowledge and forming part of loftier creeds, may well be maintained as in reasonable accordance with the evidence. Such a theory, as has been sufficiently shown in the foregoing chapters, affords a satisfactory explanation of the occurrence, in the midst of cultured religions, of intellectually low superstitions, such as that of offerings to the dead, and various others. These, which the development theory

treats naturally as survivals from a low stage of education lingering on in a higher, are by no means so readily accounted for by the degeneration theory. There are more special arguments which favour the priority of the savage to the civilized phases of the doctrine of a future life. If savages did in general receive their views of another existence from the religious systems of cultured nations, these systems can hardly have been such as recognize the dominant doctrines of heaven and hell. For, as to the locality of the future world, savage races especially favour a view little represented in civilized belief, namely, that the life to come is in some distant earthly country. Moreover, the belief in a fiery abyss or Gehenna, which excites so intensely and lays hold so firmly of the imagination of the most ignorant men, would have been especially adapted to the minds of savages, had it come down to them by tradition from an ancestral faith. Yet, in fact, the lower races so seldom recognize such an idea, that even the few cases in which it occurs lie open to suspicion of not being purely native. The proposition that the savage doctrines descend from the more civilized seems thus to involve the improbable supposition, that tribes capable of keeping up traditions of Paradise, Heaven, or Hades, should nevertheless have forgotten or discarded a tradition of Hell. Still more important is the contrast between the continuance-theory and the retribution-theory of the future existence, in the sections of culture where they respectively predominate. On the one hand, the continuance-theory, with its ideas of a ghostly life like this, is directly vouched for by the evidence of the senses in dreams and visions of the dead, and may be claimed as part of the ‘Natural Religion,’ properly so called, of the lower races. On the other hand, the retribution-theory is a dogma which this evidence of apparitions could hardly set on foot, though capable of afterwards supporting it. Throughout the present study of animistic religion, it constantly comes into view that doctrines which in the lower culture are philosophical, tend in the higher to become ethical; that what among savages is a science of nature, passes among civilized nations into a moral engine. Herein lies the distinction of deepest import between the two great theories of the soul’s existence after bodily death. According to a development theory of culture, the savage, unethical doctrine of continuance would be taken as the more primitive, succeeded in higher civilization by the ethical doctrine of retribution. Now this theory of the course of religion in the distant and obscure past is conformable with experience of its actual history, so far as this lies within our knowledge. Whether we compare the early Greek with the later Greek, the early Jew with the later Jew, the ruder races of the world in their older condition with the same races as affected by the three missionary religions of Buddhism, Mohammedanism, Christianity, the testimony of history vouches for the like transition towards ethical dogma.

In conclusion, though theological argument on the actual validity of doctrines relating to the future life can have no place here, it will be well not to pass by without further remark one great practical question which lies fairly within the province of Ethnography. How, in the various stages of culture, has the character and conduct of the living been affected by the thought of a life to come? If we take the savage beliefs as a starting-point, it will appear that these belong rather to speculative philosophy than to practical rule of life. The lower races hold opinions as to a future state because they think them true, but it is not surprising that men who take so little thought of a contingency three days off, should receive little practical impulse from vague anticipations of a life beyond the grave. Setting aside the consideration of possible races devoid of all thought of a future existence, there unquestionably has been and is a great mass of mankind whose lives are scarcely affected by such expectations of another life as they do hold. The doctrine of continuance, making death as it were a mere journey into a new country, can have little direct action on men’s conduct, though indirectly it has indeed an enormous and disastrous influence on society, leading as it does to the slaughter of wives and slaves, and the destruction of property, for the use of the dead in the next world. If this world to come be thought a happier region, the looking forward to it makes men more willing to risk their lives in battle, promotes the habit of despatching the sick and aged into a better life, and encourages suicide when life is very hateful here. When the half-way house between continuance and retribution is reached, and the idea prevails that the manly virtues which give rank and wealth and honour here will lead hereafter to yet brighter glory, then this belief must add new force to the earthly motives which make bold warriors and mighty chiefs. But among men who expect to become hovering ghosts at death, or to depart to some gloomy land of shades, such expectation strengthens the natural horror and hatred of dissolution. They tend toward the state of mind frequent among modern Africans, whose thought of death is that he shall drink no more rum, wear no more fine clothes, have no more wives. The negro of our own day would feel to the utmost the sense of those lines in the beginning of the Iliad, which describe the heroes’ ‘souls’ being cast down to Hades, but ‘themselves’ left a prey to dogs and carrion birds.

Rising to the level of the higher races, we mark the thought of future existence taking a larger and larger place in the convictions of religion, the expectation of a judgment after death gaining in intensity and becoming, what it scarcely seems to the savage, a real motive in life. Yet this change is not to be measured as proceeding throughout in any direct proportion with the development of culture. The doctrine of the future life has hardly taken deeper and stronger root in the higher than in the middle levels of civilization. In the language of ancient Egypt, it is the dead who are emphatically called the ‘living,’ for their life is everlasting, whether in the world of the departed, or nearer home in the tomb, the ‘eternal dwelling.’ The Moslem says that men sleep in life and wake in death;

the Hindu likens the body which a soul has quitted to the bed he rises from in the morning. The story of the ancient Getæ, who wept at births and laughed at funerals, embodies an idea of the relation of this life to the next which comes to the surface again and again in the history of religion, nowhere perhaps touched in with a lighter hand than in the Arabian Nights' tale where Abdallah of the Sea indignantly breaks off his friendship with Abdallah of the Land, when he hears that the dwellers on the land do not feast and sing when one of them dies, like the dwellers in the sea, but mourn and weep and tear their garments. Such thoughts lead on into the morbid asceticism that culminates in the life of the Buddhist saint, eating his food with loathing from the alms-bowl that he carries as though it held medicine, wrapping himself in grave-clothes from the cemetery, or putting on his disfigured robe as though it were a bandage to cover a sore, whose looking forward is to death for deliverance from the misery of life, whose dreamiest hope is that after an inconceivable series of successive existences he may find in utter dissolution and not-being a refuge even from heaven.

The belief in future retribution has been indeed a powerful engine in shaping the life of nations. Powerful both for good and evil, it has been made the servant-of-all-work of many faiths. Priesthoods have used it unscrupulously for their professional ends, to gain wealth and power for their own caste, to stop intellectual and social progress beyond the barriers of their consecrated systems. On the banks of the river of death, a band of priests has stood for ages to bar the passage against all poor souls who cannot satisfy their demands for ceremonies, and formulas, and fees. This is the dark side of the picture. On the bright side, as we study the moral standards of the higher nations, and see how the hopes and fears of the life to come have been brought to enforce their teachings, it is plain that through most widely differing religions the doctrine of future judgment has been made to further goodness and to check wickedness, according to the shifting rules by which men have divided right from wrong. The philosophic schools which from classic times onward have rejected the belief in a future existence, appear to have come back by a new road to the very starting-point which perhaps the rudest races of men never quitted. At least this seems true as regards the doctrine of future retribution, which is alike absent from the belief of classes of men at the two extremes of culture. How far the moral standard of life may have been adjusted throughout the higher races with reference to a life hereafter, is a problem difficult of solution, so largely do unbelievers in this second life share ethical principles which have been more or less shaped under its influence. Men who live for one world or for two, have high motives of virtue in common; the noble self-respect which impels them to the life they feel worthy of them; the love of goodness for its own sake and for its immediate results; and beyond this, the desire to do good that shall survive the doer, who will not indeed be in the land of the living to see his work, but who can yet discount his expectations into some measure of present satisfaction. Yet he who believes that his thread of life will be severed once and for ever by the fatal shears, well knows that he wants a purpose and a joy in life, which belong to him who looks for a life to come. Few men feel real contentment in the expectation of vanishing out of conscious existence, henceforth, like the great Buddha, to exist only in their works. To remain incarnate in the memory of friends is something. A few great spirits may enjoy in the reverence of future ages a thousand years or so of 'subjective immortality;' though as for mankind at large, the individual's personal interest hardly extends beyond those who have lived in his time, while his own memory scarce outlives the third and fourth generation. But over and above these secular motives, the belief in immortality extends its powerful influence through life, and culminates at the last hour, when, setting aside the very evidence of their senses, the mourners smile through their tears, and say it is not death but life.

The idea, of which the classic representative belongs to the myth of Persephone, that the living who tastes the food of the dead may not return, and which is so clearly stated in this Maori story, appears again among the Sioux of North America. Ahak-tah (‘Male Elk’) seems to die, but after two days comes down from the funeral-scaffold where his body had been laid, and tells his tale. His soul had travelled by the path of braves through the beautiful land of great trees and gay loud-singing birds, till he reached the river, and saw the homes of the spirits of his forefathers on the shore beyond. Swimming across, he entered the nearest house, where he found his uncle sitting in a corner. Very hungry, he noticed some wild rice in a bark dish. ‘I asked my uncle for some rice to eat, but he did not give it to me. Had I eaten of the food for spirits, I never should have returned to earth.’ Eastman, ‘Dacotah,’ p. 177.

CHAPTER XIV. ANIMISM (_continued_).

Animism, expanding from the Doctrine of Souls to the wider Doctrine of Spirits, becomes a complete Philosophy of Natural Religion—Definition of Spirits similar to and apparently modelled on that of Souls—Transition stage: classes of Souls passing into good and evil Demons—Manes-Worship—Doctrine of Embodiment of Spirits in human, animal, vegetable, and inert bodies—Demoniacal Possession and Obsession as causes of Disease and Oracle-inspiration—Fetishism—Disease-spirits embodied—Ghost attached to remains of Corpse—Fetish produced by a Spirit embodied in, attached to, or operating through, an Object—Analogues of Fetish-doctrine in Modern Science—Stock-and-Stone Worship—Idolatry—Survival of Animistic Phraseology

in modern Language—Decline of Animistic theory of Nature.

The general scheme of Animism, of which the doctrine of souls hitherto discussed forms part, thence expands to complete the full general philosophy of Natural Religion among mankind. Conformably with that early childlike philosophy in which human life seems the direct key to the understanding of nature at large, the savage theory of the universe refers its phenomena in general to the wilful action of pervading personal spirits. It was no spontaneous fancy, but the reasonable inference that effects are due to causes, which led the rude men of old days to people with such ethereal phantoms their own homes and haunts, and the vast earth and sky beyond. Spirits are simply personified causes. As men's ordinary life and actions were held to be caused by souls, so the happy or disastrous events which affect mankind, as well as the manifold physical operations of the outer-world, were accounted for as caused by soul-like beings, spirits whose essential similarity of origin is evident through all their wondrous variety of power and function. Much that the primitive animistic view thus explains, has been indeed given over by more advanced education to the 'metaphysical' and 'positive' stages of thought. Yet animism is still plainly to be traced onward from the intellectual state of the lower races, along the course of the higher culture, whether its doctrines have been continued and modified into the accepted philosophy of religion, or whether they have dwindled into mere survivals in popular superstition. Though all I here undertake is to sketch in outline such features of this spiritualistic philosophy as I can see plainly enough to draw at all, scarcely attempting to clear away the haze that covers great parts of the subject, yet even so much as I venture on is a hard task, made yet harder by the responsibility attaching to it. For it appears that to follow the course of animism on from its more primitive stages, is to account for much of mediæval and modern opinion whose meaning and reason could hardly be comprehended without the aid of a development-theory of culture, taking in the various processes of new formation, abolition, survival, and revival. Thus even the despised ideas of savage races become a practically important topic to the modern world, for here, as usual, whatever bears on the origin of philosophic opinion, bears also on its validity.

At this point of the investigation, we come fully into sight of the principle which has been all along implied in the use of the word Animism, in a sense beyond its narrower meaning of the doctrine of souls. By using it to express the doctrine of spirits generally, it is practically asserted that the idea of souls, demons, deities, and any other classes of spiritual beings, are conceptions of similar nature throughout, the conceptions of souls being the original ones of the series. It was best, from this point of view, to begin with a careful study of souls, which are the spirits proper to men, animals, and things, before extending the survey of the spirit-world to its fullest range. If it be admitted that souls and other spiritual beings are conceived of as essentially similar in their nature, it may be reasonably argued that the class of conceptions based on evidence most direct and accessible to ancient men, is the earlier and fundamental class. To grant this, is in effect to agree that the doctrine of souls, founded on the natural perceptions of primitive man, gave rise to the doctrine of spirits, which extends and modifies its general theory for new purposes, but in developments less authenticated and consistent, more fanciful and far-fetched. It seems as though the conception of a human soul, when once attained to by man, served as a type or model on which he framed not only his ideas of other souls of lower grade, but also his ideas of spiritual beings in general, from the tiniest elf that sports in the long grass up to the heavenly Creator and Ruler of the world, the Great Spirit.

The doctrines of the lower races fully justify us in classing their spiritual beings in general as similar in nature to the souls of men. It will be incidentally shown here, again and again, that souls have the same qualities attributed to them as other spirits, are treated in like fashion, and pass without distinct breaks into every part of the general spiritual definition. The similar nature of soul and other spirit is, in fact, one of the commonplaces of animism, from its rudest to its most cultured stages. It ranges from the native New Zealanders' and West Indians' conceptions of the 'atua' and the 'cemi,' beings which require special definition to show whether they are human souls or demons or deities of some other class,[229] and so onward to the declaration of Philo Judæus, that souls, demons, and angels differ indeed in name, but are in reality one,[230] and to the state of mind of the modern Roman Catholic priest, who is cautioned in the rubric concerning the examination of a possessed patient, not to believe the demon if he pretends to be the soul of some saint or deceased person, or a good angel (neque ei credatur, si dæmon simularet se esse animam alicujus Sancti, vel defuncti, vel Angelum bonum).[231] Nothing can bring more broadly into view the similar nature of souls and other spiritual beings than the existence of a full transitional series of ideas. Souls of dead men are in fact considered as actually forming one of the most important classes of demons and deities.

It is quite usual for savage tribes to live in terror of the souls of the dead as harmful spirits. Thus Australians have been known to consider the ghosts of the unburied dead as becoming malignant demons.[232] New Zealanders have supposed the souls of their dead to become so changed in nature as to be malignant to their nearest and dearest friends in life;[233] the Caribs said that, of man's various souls, some go to the seashore and capsize boats, others to the forest to be evil spirits;[234] among the Sioux

Indians the fear of a ghost's vengeance has been found to act as a check on murder;[235] of some tribes in Central Africa it may be said that their main religious doctrine is the belief in ghosts, and that the main characteristic of these ghosts is to do harm to the living.[236] The Patagonians lived in terror of the souls of their wizards, which become evil demons after death;[237] Turanian tribes of North Asia fear their shamans even more when dead than when alive, for they become a special class of spirits who are the hurtfullest in all nature, and who among the Mongols plague the living on purpose to make them bring offerings.[238] In China it is held that the multitudes of wretched destitute spirits in the world below, such as souls of lepers and beggars, can sorely annoy the living; therefore at certain times they are to be appeased with offerings of food, scant and beggarly; and a man who feels unwell, or fears a mishap in business, will prudently have some mock-clothing and mock-money burnt for these 'gentlemen of the lower regions.'[239] Notions of this sort are widely prevalent in Indo-China and India; whole orders of demons there were formerly human souls, especially of people left unburied or slain by plague or violence, of bachelors or of women who died in childbirth, and who henceforth wreak their vengeance on the living. They may, however, be propitiated by temples and offerings, and thus have become in fact a regular class of local deities.[240] Among them may be counted the diabolic soul of a certain wicked British officer, whom native worshippers in the Tinnevelly district still propitiate by offering at his grave the brandy and cheroots he loved in life.[241] India even carried theory into practice by an actual manufacture of demons, as witness the two following accounts. A certain brahman, on whose lands a kshatriya raja had built a house, ripped himself up in revenge, and became a demon of the kind called brahmadasyu, who has been ever since the terror of the whole country, and is the most common village deity in Kharakpur.[242] Toward the close of the last century there were two brahmans, out of whose house a man had wrongfully, as they thought, taken forty rupees; whereupon one of the brahmans proceeded to cut off his own mother's head, with the professed view, entertained by both mother and son, that her spirit, excited by the beating of a large drum during forty days, might haunt, torment, and pursue to death the taker of their money and those concerned with him. Declaring with her last words that she would blast the thief, the spiteful hag deliberately gave up her life to take ghostly vengeance for those forty rupees.[243] By instances like these it appears that we may trace up from the psychology of the lower races the familiar ancient and modern European tales of baleful ghost-demons. The old fear even now continues to vouch for the old belief.

Happily for man's anticipation of death, and for the treatment of the sick and aged, thoughts of horror and hatred do not preponderate in ideas of deified ancestors, who are regarded on the whole as kindly patron spirits, at least to their own kinsfolk and worshippers. Manes-worship is one of the great branches of the religion of mankind. Its principles are not difficult to understand, for they plainly keep up the social relations of the living world. The dead ancestor, now passed into a deity, simply goes on protecting his own family and receiving suit and service from them as of old; the dead chief still watches over his own tribe, still holds his authority by helping friends and harming enemies, still rewards the right and sharply punishes the wrong. It will be enough to show by a few characteristic examples the general position of manes-worship among mankind, from the lower culture upward.[244] In the two Americas it appears not unfrequently, from the low savage level of the Brazilian Camacans, to the somewhat higher stage of northern Indian tribes whom we hear of as praying to the spirits of their forefathers for good weather or luck in hunting, and fancying when an Indian falls into the fire that the ancestral spirits pushed him in to punish neglect of the customary gifts, while the Natchez of Louisiana are said to have even gone so far as to build temples for dead men.[245] Turning to the dark races of the Pacific, we find the Tasmanians laying their sick round a corpse on the funeral pile, that the dead might come in the night and take out the devils that caused the diseases; it is asserted in a general way of the natives, that they believed most implicitly in the return of the spirits of their departed friends or relations to bless or injure them as the case might be.[246] In Tanna, the gods are spirits of departed ancestors, aged chiefs becoming deities after death, presiding over the growth of yams and fruit trees, and receiving from the islanders prayer and offerings of first fruits.[247] Nor are the fairer Polynesians behind in this respect. Below the great mythological gods of Tonga and New Zealand, the souls of chiefs and warriors form a lower but active and powerful order of deities, who in the Tongan paradise intercede for man's benefit with the higher deities, who direct the Maori war parties on the march, hover over them and give them courage in the fight, and, watching jealously their own tribes and families, punish any violation of the sacred laws of tapu.[248] Thence we trace the doctrine into the Malay islands, where the souls of deceased ancestors are looked to for prosperity in life and help in distress.[249] In Madagascar, the worship of the spirits of the dead is remarkably associated with the Vazimbas, the aborigines of the island, who are said still to survive as a distinct race in the interior, and whose peculiar graves testify to their former occupancy of other districts. These graves, small in size, and distinguished by a cairn and an upright stone slab or altar, are places which the Malagasy regard with equal fear and veneration, and their faces become sad and serious when they even pass near. To take a stone or pluck a twig from one of these graves, to stumble against one in the dark, would be resented by the angry Vazimba inflicting disease, or coming in the night to carry off the offender to the region of ghosts. The Malagasy is thus enabled to account for every otherwise unaccountable ailment by his having knowingly or unknowingly given offence to some Vazimba. They are not indeed always malevolent, they may be placable or implacable, or

partake of both characters. Thus it comes to pass, that at the altar-slab which long ago some rude native family set up for commemoration or dutiful offering of food to a dead kinsman, a barbaric supplanting race now comes to smear the burnt fat of sacrifice, and set up the heads of poultry and sheep and the horns of bullocks, that the mysterious tenant may be kind, not cruel, with his superhuman powers.[250]

On the continent of Africa, manes-worship appears with extremest definiteness and strength. Thus Zulu warriors, aided by the 'amatongo,' the spirits of their ancestors, conquer in the battle; but if the dead turn their backs on the living, the living fall in the fight, to become ancestral spirits in their turn. In anger the 'itongo' seizes a living man's body and inflicts disease and death; in beneficence he gives health, and cattle, and corn, and all men wish. Even the little children and old women, of small account in life, become at death spirits having much power, the infants for kindness, the crones for malice. But it is especially the head of each family who receives the worship of his kin. Why it is naturally and reasonably so, a Zulu thus explains. 'Although they worship the many Amatongo of their tribe, making a great fence around them for their protection; yet their father is far before all others when they worship the Amatongo. Their father is a great treasure to them even when he is dead. And those of his children who are already grown up know him thoroughly, his gentleness, and his bravery.' 'Black people do not worship all Amatongo indifferently, that is, all the dead of their tribe. Speaking generally, the head of each house is worshipped by the children of that house; for they do not know the ancients who are dead, nor their laud-giving names, nor their names. But their father whom they knew is the head by whom they begin and end in their prayer, for they know him best, and his love for his children; they remember his kindness to them whilst he was living; they compare his treatment of them whilst he was living, support themselves by it, and say, "He will still treat us in the same way now he is dead. We do not know why he should regard others besides us; he will regard us only."'[251] It will be seen in another place how the Zulu follows up the doctrine of divine ancestors till he reaches a first ancestor of man and creator of the world, the primæval Unkulunkulu. In West Africa, manes-worship displays in contrast its two special types. On the one hand, we see the North Guinea negroes transferring the souls of the dead, according to their lives, to the rank of good and evil spirits, and if evil worshipping them the more zealously, as fear is to their minds a stronger impulse than love. On the other hand, in Southern Guinea, we see the deep respect paid to the aged during life, passing into worship when death has raised them to yet higher influence. There the living bring to the images of the dead food and drink, and even a small portion of their profits gained in trade; they look especially to dead relatives for help in the trials of life, and 'it is no uncommon thing to see large groups of men and women, in times of peril or distress, assembled along the brow of some commanding eminence, or along the skirts of some dense forest, calling in the most piteous and touching tones upon the spirits of their ancestors.'[252]

In Asia, manes-worship comes to the surface in all directions. The rude Veddas of Ceylon believe in the guardianship of the spirits of the dead; these, they say, are 'ever watchful, coming to them in sickness, visiting them in dreams, giving them flesh when hunting;' and in every calamity and want they call for aid on the 'kindred spirits,' and especially the shades of departed children, the 'infant spirits.'[253] Among non-Hindu tribes of India, whose religions more or less represent præ-Brahmanic and præ-Buddhistic conditions, wide and deep traces appear of an ancient and surviving cultus of ancestors.[254] Among Turanian tribes spread over the northern regions of the Old World, a similar state of things may be instanced from the Mongols, worshipping as good deities the princely souls of Genghis Khan's family, at whose head stands the divine Genghis himself.[255] Nor have nations of the higher Asiatic culture generally rejected the time-honoured rite. In Japan the 'Way of the Kami,' better known to foreigners as the Sin-tu religion, is one of the officially recognized faiths, and in it there is still kept up in hut and palace the religion of the rude old mountain-tribes of the land, who worshipped their divine ancestors, the Kami, and prayed to them for help and blessing. To the time of these ancient Kami, say the modern Japanese, the rude stone implements belong which are found in the ground in Japan as elsewhere: to modern ethnologists, however, these bear witness not of divine but savage parentage.[256] In Siam the lower orders scruple to worship the great gods, lest through ignorance they should blunder in the complex ritual; they prefer to pray to the 'theparak,' a lower class of deities among whom the souls of great men take their places at death.[257] In China, as every one knows, ancestor-worship is the dominant religion of the land, and interesting problems are opened out to the Western mind by the spectacle of a great people who for thousands of years have been thus seeking the living among the dead. Nowhere is the connexion between parental authority and conservatism more graphically shown. The worship of ancestors, begun during their life, is not interrupted but intensified when death makes them deities. The Chinese, prostrate bodily and mentally before the memorial tablets that contain the souls of his ancestors, little thinks that he is all the while proving to mankind how vast a power unlimited filial obedience, prohibiting change from ancestral institutions, may exert in stopping the advance of civilization. The thought of the souls of the dead as sharing the happiness and glory of their descendants is one which widely pervades the world, but most such ideas would seem vague and weak to the Chinese, who will try hard for honour in his competitive examination with the special motive of glorifying his dead ancestors, and whose titles of rank will raise his deceased father and grandfather a grade above himself, as

though, with us, Zachary Macaulay and Copley the painter should now have viscounts' coronets officially placed on their tombstones. As so often happens, what is jest to one people is sober sense to another. There are 300 millions of Chinese who would hardly see a joke in Charles Lamb reviling the stupid age that would not read him, and declaring that he would write for antiquity. Had he been a Chinese himself, he might have written his book in all seriousness for the benefit of his great-great-grandfather. Among the Chinese, manes-worship is no rite of mere affection. The living want the help of the ancestral spirits, who reward virtue and punish vice: 'The exalted ancestor will bring thee, O Prince, much good!'—'Ancestors and fathers will abandon you and give you up, and come not to help, and ye will die.' If no help comes in time of need, the Chinese will reproach his ancestor, or even come to doubt his existence. Thus in a Chinese ode the sufferers in a dreadful drought cry, 'Heu-tsi cannot or will not help.... Our ancestors have surely perished.... Father, mother, ancestors, how could you calmly bear this?' Nor does manes-worship stop short with direct family ties; it is naturally developed to produce, by deification of the heroic dead, a series of superior gods to whom worship is given by the public at large. Thus, according to legend, the War-god or Military Sage was once in human life a distinguished soldier, the Mechanics' god was a skilful workman and inventor of tools, the Swine-god was a hog-breeder who lost his pigs and died of sorrow, and the Gamblers' god, a desperate gamester who lost his all and died of want, is represented by a hideous image called a 'devil gambling for cash,' and in this shape receives the prayers and offerings of confirmed gamblers, his votaries. The spirits of San-kea Ta-te, and Chang-yuen-sze go to partake of the offerings set out in their temples, returning flushed and florid from their meal; and the spirit of Confucius is present in the temple, where twice a year the Emperor does sacrifice to him.[258]

The Hindu unites in some degree with the Chinese as to ancestor-worship, and especially as to the necessity of having a son by blood or adoption, who shall offer the proper sacrifices to him after death. 'May there be born in our lineage,' the manes are supposed to say, 'a man to offer to us, on the thirteenth day of the moon, rice boiled in milk, honey and ghee.' Offerings made to the divine manes, the 'pitaras' (patres, fathers) as they are called, preceded and followed by offerings to the greater deities, give to the worshipper merit and happiness.[259] In classic Europe, apotheosis lies part within the limits of myth, where it was applied to fabled ancestors, and part within the limits of actual history, as where Julius and Augustus shared its honours with the vile Domitian and Commodus. The most special representatives of ancestor-worship in Europe were perhaps the ancient Romans, whose word 'manes' has become the recognized name for ancestral deities in modern civilized language; they embodied them as images, set them up as household patrons, gratified them with offerings and solemn homage, and counting them as or among the infernal gods, inscribed on tombs D. M., 'Diis Manibus.'[260] The occurrence of this D. M. in Christian epitaphs is an often-noticed case of religious survival.

Although full ancestor-worship is not practised in modern Christendom, there remains even now within its limits a well-marked worship of the dead. A crowd of saints, who were once men and women, now form an order of inferior deities, active in the affairs of men and receiving from them reverence and prayer, thus coming strictly under the definition of manes. This Christian cultus of the dead, belonging in principle to the older manes-worship, was adapted to answer another purpose in the course of religious transition in Europe. The local gods, the patron gods of particular ranks and crafts, the gods from whom men sought special help in special needs, were too near and dear to the inmost heart of præ-Christian Europe to be done away with without substitutes. It proved easier to replace them by saints who could undertake their particular professions, and even succeed them in their sacred dwellings. The system of spiritual division of labour was in time worked out with wonderful minuteness in the vast array of professional saints, among whom the most familiar to modern English ears are St. Cecilia, patroness of musicians; St. Luke, patron of painters; St. Peter, of fishmongers; St. Valentine, of lovers; St. Sebastian, of archers; St. Crispin, of cobblers; St. Hubert, who cures the bite of mad dogs; St. Vitus, who delivers madmen and sufferers from the disease which bears his name; St. Fiacre, whose name is now less known by his shrine than by the hackney-coaches called after him in the seventeenth century. Not to dwell here minutely on an often-treated topic, it will be enough to touch on two particular points. First, as to the direct historical succession of the Christian saint to the heathen deity, the following are two very perfect illustrations. It is well known that Romulus, mindful of his own adventurous infancy, became after death a Roman deity propitious to the health and safety of young children, so that nurses and mothers would carry sickly infants to present them in his little round temple at the foot of the Palatine. In after ages the temple was replaced by the church of St. Theodorus, and there Dr. Conyers Middleton, who drew public attention to its curious history, used to look in and see ten or a dozen women, each with a sick child in her lap, sitting in silent reverence before the altar of the saint. The ceremony of blessing children, especially after vaccination, may still be seen there on Thursday mornings.[261] Again, Sts. Cosmas and Damianus, according to Maury, owe their recognized office to a similar curious train of events. They were martyrs who suffered under Diocletian, at Ægææ in Cilicia. Now this place was celebrated for the worship of Æsculapius, in whose temple incubation, i.e. sleeping for oracular dreams, was practised. It seems as though the idea was transferred on the spot to the

two local saints, for we next hear of them as appearing in a dream to the Emperor Justinian, when he was ill at Byzantium. They cured him, he built them a temple, their cultus spread far and wide, and they frequently appeared to the sick to show them what they should do. Legend settled that Cosmas and Damianus were physicians while they lived on earth, and at any rate they are patron-saints of the profession of medicine to this day.[262] Second, as to the actual state of hagiolatry in modern Europe, it is obvious on a broad view that it is declining among the educated classes. Yet modern examples may be brought forward to show ideas as extreme as those which prevailed more widely a thousand years ago. In the Church of the Jesuit College at Rome lies buried St. Aloysius Gonzaga, on whose festival it is customary especially for the college students to write letters to him, which are placed on his gaily decorated and illuminated altar, and afterwards burnt unopened. The miraculous answering of these letters is vouched for in an English book of 1870. To the same year belongs an English tract commemorating a late miraculous cure. An Italian lady afflicted with a tumour and incipient cancer of the breast was exhorted by a Jesuit priest to recommend herself to the Blessed John Berchmans, a pious Jesuit novice from Belgium, who died in 1621, and was beatified in 1865. Her adviser procured for her 'three small packets of dust gathered from the coffin of this saintly innocent, a little cross made of the boards of the room the blessed youth occupied, as well as some portion of the wadding in which his venerable head was wrapped.' During nine days' devotion the patient accordingly invoked the Blessed John, swallowed small portions of his dust in water, and at last pressed the cross to her breast so vehemently that she was seized with sickness, went to sleep, and awoke without a symptom of the complaint. And when Dr. Panegrossi the physician beheld the incredible cure, and heard that the patient had addressed herself to the Blessed Berchmans, he bowed his head, saying, 'When such physicians interfere, we have nothing more to say!'[263] To sum up the whole history of manes-worship, it is plain that in our time the dead still receive worship from far the larger half of mankind, and it may have been much the same ever since the remote periods of primitive culture in which the religion of the manes probably took its rise.

It has now been seen that the theory of souls recognizes them as capable either of independent existence, or of inhabiting human, animal, or other bodies. On the principle here maintained, that the general theory of spirits is modelled on the theory of souls, we shall be able to account for several important branches of the lower philosophy of religion, which without such explanation may appear in great measure obscure or absurd. Like souls, other spirits are supposed able either to exist and act flitting free about the world, or to become incorporate for more or less time in solid bodies. It will be well at once to get a secure grasp of this theory of Embodiment, for without it we shall be stopped every moment by a difficulty in understanding the nature of spirits, as defined in the lower animism. The theory of embodiment serves several highly important purposes in savage and barbarian philosophy. On the one hand it provides an explanation of the phenomena of morbid exaltation and derangement, especially as connected with abnormal utterance, and this view is so far extended as to produce an almost general doctrine of disease. On the other hand, it enables the savage either to 'lay' a hurtful spirit in some foreign body, and so get rid of it, or to carry about a useful spirit for his service in a material object, to set it up as a deity for worship in the body of an animal, or in a block or stone or image or other thing, which contains the spirit as a vessel contains a fluid: this is the key to strict fetishism, and in no small measure to idolatry. In briefly considering these various branches of the Embodiment-theory, there may be conveniently included certain groups of cases often impossible to distinguish apart. These cases belong theoretically rather to obsession than possession, the spirits not actually inhabiting the bodies, but hanging or hovering about them and affecting them from the outside.

As in normal conditions the man's soul, inhabiting his body, is held to give it life, to think, speak, and act through it, so an adaptation of the self-same principle explains abnormal conditions of body or mind, by considering the new symptoms as due to the operation of a second soul-like being, a strange spirit. The possessed man, tossed and shaken in fever, pained and wrenched as though some live creature were tearing or twisting him within, pining as though it were devouring his vitals day by day, rationally finds a personal spiritual cause for his sufferings. In hideous dreams he may even sometimes see the very ghost or nightmare-fiend that plagues him. Especially when the mysterious unseen power throws him helpless on the ground, jerks and writhes him in convulsions, makes him leap upon the bystanders with a giant's strength and a wild beast's ferocity, impels him, with distorted face and frantic gesture, and voice not his own nor seemingly even human, to pour forth wild incoherent raving, or with thought and eloquence beyond his sober faculties to command, to counsel, to foretell—such a one seems to those who watch him, and even to himself, to have become the mere instrument of a spirit which has seized him or entered into him, a possessing demon in whose personality the patient believes so implicitly that he often imagines a personal name for it, which it can declare when it speaks in its own voice and character through his organs of speech; at last, quitting the medium's spent and jaded body, the intruding spirit departs as it came. This is the savage theory of dæmoniacal possession and obsession, which has been for ages, and still remains, the dominant theory of disease and inspiration among the lower races. It is obviously based on an animistic interpretation, most genuine and rational in its proper place in man's intellectual history, of the actual symptoms of the cases. The general doctrine of

disease-spirits and oracle-spirits appears to have its earliest, broadest, and most consistent position within the limits of savagery. When we have gained a clear idea of it in this its original home, we shall be able to trace it along from grade to grade of civilization, breaking away piecemeal under the influence of new medical theories, yet sometimes expanding in revival, and at least in lingering survival holding its place into the midst of our modern life. The possession-theory is not merely known to us by the statements of those who describe diseases in accordance with it. Disease being accounted for by attack of spirits, it naturally follows that to get rid of these spirits is the proper means of cure. Thus the practices of the exorcist appear side by side with the doctrine of possession, from its first appearance in savagery to its survival in modern civilization; and nothing could display more vividly the conception of a disease or a mental affection as caused by a personal spiritual being than the proceedings of the exorcist who talks to it, coaxes or threatens it, makes offerings to it, entices or drives it out of the patient's body, and induces it to take up its abode in some other. That the two great effects ascribed to such spiritual influence in obsession and possession, namely, the infliction of ailments and the inspiration of oracles, are not only mixed up together but often run into absolute coincidence, accords with the view that both results are referred to one common cause. Also that the intruding or invading spirit may be either a human soul or may belong to some other class in the spiritual hierarchy, countenances the opinion that the possession-theory is derived from, and indeed modelled on, the ordinary theory of the soul acting on the body. In illustrating the doctrine by typical examples from the enormous mass of available details, it will hardly be possible to discriminate among the operating spirits, between those which are souls and those which are demons, nor to draw an exact line between obsession by a demon outside and possession by a demon inside, nor between the condition of the demon-tormented patient and the demon-actuated doctor, seer, or priest. In a word, the confusion of these conceptions in the savage mind only fairly represents their intimate connexion in the Possession-theory itself.

In the Australian-Tasmanian district, disease and death are ascribed to more or less defined spiritual influences; descriptions of a demon working a sorcerer's wicked will by coming slyly behind his victim and hitting him with his club on the back of his neck, and of a dead man's ghost angered by having his name uttered, and creeping up into the utterer's body to consume his liver, are indeed peculiarly graphic details of savage animism.[264] The theory of disease-spirits is well stated in its extreme form among the Mintira, a low race of the Malay peninsula. Their 'hantu' or spirits have among their functions that of causing ailments; thus the 'hantu kalumbahan' causes small-pox; the 'hantu kamang' brings on inflammation and swellings in the hands and feet; when a person is wounded, the 'hantu pari' fastens on the wound and sucks, and this is the cause of the blood flowing. And thus, as the describer says, 'To enumerate the remainder of the hantus would be merely to convert the name of every species of disease known to the Mintira into a proper one. If any new disease appeared, it would be ascribed to a hantu bearing the same name.'[265] It will help us to an idea of the distinct personality which the disease-demon has in the minds of the lower races, to notice the Orang Laut of this district placing thorns and brush in the paths leading to a part where small-pox had broken out, to keep the demons off; just as the Khonds of Orissa try with thorns, and ditches, and stinking oil poured on the ground, to barricade the paths to their hamlets against the goddess of small-pox, Jugah Pennu.[266] Among the Dayaks of Borneo, 'to have been smitten by a spirit' is to be ill; sickness may be caused by invisible spirits inflicting invisible wounds with invisible spears, or entering men's bodies and driving out their souls, or lodging in their hearts and making them raving mad. In the Indian Archipelago, the personal semi-human nature of the disease-spirits is clearly acknowledged by appeasing them with feasts and dances and offerings of food set out for them away in the woods, to induce them to quit their victims, or by sending tiny proas to sea with offerings, that spirits which have taken up their abode in sick men's bowels may embark and not come back.[267] The animistic theory of disease is strongly marked in Polynesia, where every sickness is ascribed to spiritual action of deities, brought on by the offerings of enemies, or by the victim's violation of the laws of tapu. Thus in New Zealand each ailment is caused by a spirit, particularly an infant or undeveloped human spirit, which sent into the patient's body gnaws and feeds inside; and the exorcist, finding the path by which such a disease-spirit came from below to feed on the vitals of a sick relative, will persuade it by a charm to get upon a flax-stalk and set off home. We hear, too, of an idea of the parts of the body—forehead, breast, stomach, feet, &c.—being apportioned each to a deity who inflicts aches and pains and ailments there.[268] So in the Samoan group, when a man was near death, people were anxious to part on good terms with him, feeling assured that if he died with angry feelings towards any one, he would certainly return and bring calamity on that person or some one closely allied to him. This was considered a frequent source of disease and death, the spirit of a departed member of the family returning and taking up his abode in the head, chest, or stomach of a living man, and so causing sickness and death. If a man died suddenly, it was thought that he was eaten by the spirit that took him; and though the soul of one thus devoured would go to the common spirit-land of the departed, yet it would have no power of speech there, and if questioned could but beat its breast. It completes this account to notice that the disease-inflicting souls of the departed were the same which possessed the living under more favourable circumstances, coming to talk through a certain member of the family, prophesying future events, and giving directions as to family affairs.[269] Farther east, in the Georgian and Society Islands, evil demons are sent to scratch and tear people into convulsions and hysterics, to torment poor wretches as with barbed hooks, or to twist and knot

inside them till they die writhing in agony. But madmen are to be treated with great respect, as entered by a god, and idiots owe the kindness with which they are appeased and coaxed to the belief in their superhuman inspiration.[270] Here, and elsewhere in the lower culture, the old real belief has survived which has passed into a jest of civilized men in the famous phrase of the 'inspired idiot.'

American ethnography carries on the record of rude races ascribing disease to the action of evil spirits. Thus the Dacotas believe that the spirits punish them for misconduct, especially for neglecting to make feasts for the dead; these spirits have the power to send the spirit of something, as of a bear, deer, turtle, fish, tree, stone, worm, or deceased person, which entering the patient causes disease; the medicine-man's cure consists in reciting charms over him, singing 'He-le-li-lah, &c.,' to the accompaniment of a gourd-rattle with beads inside, ceremonially shooting a symbolic bark representation of the intruding creature, sucking over the seat of pain to get the spirit out, and firing guns at it as it is supposed to be escaping.[271] Such processes were in full vogue in the West Indies in the time of Columbus, when Friar Roman Pane put on record his quaint account of the native sorcerer pulling the disease off the patient's legs (as one pulls off a pair of trousers), going out of doors to blow it away, and bidding it begone to the mountain or the sea; the performance concluding with the regular sucking-cure and the pretended extraction of some stone or bit of flesh, or such thing, which the patient is assured that his patron-spirit or deity (cemi) put into him to cause the disease, in punishment for neglect to build him a temple or honour him with prayer or offerings of goods.[272] Patagonians considered sickness as caused by a spirit entering the patient's body; 'they believe every sick person to be possessed of an evil demon; hence their physicians always carry a drum with figures of devils painted on it, which they strike at the beds of sick persons to drive out from the body the evil demon which causes the disorder.'[273] In Africa, according to the philosophy of the Basutos and the Zulus, the causes of disease are the ghosts of the dead, come to draw the living to themselves, or to compel them to sacrifice meat-offerings. They are recognized by the diviners, or by the patient himself, who sees in dreams the departed spirit come to torment him. Congo tribes in like manner consider the souls of the dead, passed into the ranks of powerful spirits, to cause disease and death among mankind. Thus, in both these districts, medicine becomes an almost entirely religious matter of propitiatory sacrifice and prayer addressed to the disease-inflicting manes. The Barolong give a kind of worship to deranged persons, as being under the direct influence of a deity; while in East Africa the explanation of madness and idiocy is simple and typical—'he has fiends.'[274] Negroes of West Africa, on the supposition that an attack of illness has been caused by some spiritual being, can ascertain to their satisfaction what manner of spirit has done it, and why. The patient may have neglected his 'wong' or fetish-spirit, who has therefore made him ill; or it may be his own 'kla' or personal guardian-spirit, who on being summoned explains that he has not been treated respectfully enough, &c.; or it may be a 'sisa' or ghost of some dead man, who has taken this means of making known that he wants perhaps a gold ornament that was left behind when he died.[275] Of course, the means of cure will then be to satisfy the demands of the spirit. Another aspect of the negro doctrine of disease-spirits is displayed in the following description from Guinea, by the Rev. J. L. Wilson, the missionary:—'Demoniacal possessions are common, and the feats performed by those who are supposed to be under such influence are certainly not unlike those described in the New Testament. Frantic gestures, convulsions, foaming at the mouth, feats of supernatural strength, furious ravings, bodily lacerations, gnashing of teeth, and other things of a similar character, may be witnessed in most of the cases which are supposed to be under diabolical influence.'[276] The remark several times made by travellers is no doubt true, that the spiritualistic theory of disease has tended strongly to prevent progress in the medical art among the lower races. Thus among the Bodo and Dhimal of North-East India, who ascribe all diseases to a deity tormenting the patient for some impiety or neglect, the exorcists divine the offended god and appease him with the promised sacrifice of a hog; these exorcists are a class of priests, and the people have no other doctors.[277] Where the world-wide doctrine of disease-demons has held sway, men's minds, full of spells and ceremonies, have scarce had room for thought of drugs and regimen.

The cases in which disease-possession passes into oracle-possession are especially connected with hysterical, convulsive, and epileptic affections. Mr. Backhouse describes a Tasmanian native sorcerer, 'affected with fits of spasmodic contraction of the muscles of one breast, which he attributes, as they do all other diseases, to the devil'; this malady served to prove his inspiration to his people.[278] When Dr. Mason was preaching near a village of heathen Pwo, a man fell down in an epileptic fit, his familiar spirit having come over him to forbid the people to listen to the missionary, and he sang out his denunciations like one frantic. This man was afterwards converted, and told the missionary that 'he could not account for his former exercises, but that it certainly appeared to him as though a spirit spoke, and he must tell what was communicated.' In this Karen district flourishes the native 'wee' or prophet, whose business is to work himself into the state in which he can see departed spirits, visit their distant home, and even recall them to the body, thus raising the dead; these wees are nervous excitable men, such as would become mediums, and in giving oracles they go into actual convulsions.[279] Dr. Callaway's details of the state of the Zulu diviners are singularly instructive. Their symptoms are ascribed to possession by 'amatongo' or ancestral spirits; the disease is common, from some it departs of its

own accord, others have the ghost laid which causes it, and others let the affection take its course and become professional diviners, whose powers of finding hidden things and giving apparently inaccessible information are vouched for by native witnesses, who at the same time are not blind to their tricks and their failures. The most perfect description is that of a hysterical visionary, who had ‘the disease which precedes the power to divine.’ This man describes that well-known symptom of hysteria, the heavy weight creeping up within him to his shoulders, his vivid dreams, his waking visions of objects that are not there when he approaches, the songs that come to him without learning, the sensation of flying in the air. This man was ‘of a family who are very sensitive, and become doctors.’[280] Persons whose constitutional unsoundness induces morbid manifestations are indeed marked out by nature to become seers and sorcerers. Among the Patagonians, patients seized with falling sickness or St. Vitus’s dance were at once selected for magicians, as chosen by the demons themselves who possessed, distorted, and convulsed them.[281] Among Siberian tribes, the shamans select children liable to convulsions as suitable to be brought up to the profession, which is apt to become hereditary with the epileptic tendencies it belongs to.[282] Thus, even in the lower culture, a class of sickly brooding enthusiasts begin to have that power over the minds of their lustier fellows, which they have kept in so remarkable a way through the course of history.

Morbid oracular manifestations are habitually excited on purpose, and moreover the professional sorcerer commonly exaggerates or wholly feigns them. In the more genuine manifestations the medium may be so intensely wrought upon by the idea that a possessing spirit is speaking from within him, that he may not only give this spirit’s name and speak in its character, but possibly may in good faith alter his voice to suit the spiritual utterance. This gift of spirit-utterance, which belongs to ‘ventriloquism’ in the ancient and proper sense of the term, of course lapses into sheer trickery. But that the phenomena should be thus artificially excited or dishonestly counterfeited, rather confirms than alters the present argument. Real or simulated, the details of oracle-possession alike illustrate popular belief. The Patagonian wizard begins his performance with drumming and rattling till the real or pretended epileptic fit comes on by the demon entering him, who then answers questions from within him with a faint and mournful voice.[283] In Southern India and Ceylon the so-called ‘devil-dancers’ have to work themselves into paroxysms, to gain the inspiration whereby they profess to cure their patients.[284] So, with furious dancing to the music and chanting of the attendants, the Bodo priest brings on the fit of maniacal inspiration in which the deity fills him and gives oracles through him.[285] In Kamchatka the female shamans, when Billukai came down into them in a thunderstorm, would prophesy; or, receiving spirits with a cry of ‘hush!’ their teeth chattered as in fever, and they were ready to divine.[286] Among the Singpho of South-East Asia, when the ‘natzo’ or conjurer is sent for to a sick patient, he calls on his ‘nat’ or demon, the soul of a deceased foreign prince, who descends into him and gives the required answers.[287] In the Pacific Islands, spirits of the dead would enter for a time the body of a living man, inspiring him to declare future events, or to execute some commission from the higher deities. The symptoms of oracular poss

March, 1901.

CONTENTS

Editorial Note. Author's Preface. The Fundamental Principles Of Old And New World Civilizations. Appendix I. Comparative Table of some Quechua, Nahuatl and Maya Words. Appendix II. A Prayer-meeting of the Star-worshippers. Appendix III. Comparative Lists of Words. Index. Note. Footnotes

EDITORIAL NOTE.

The author of this volume explains in her preface how she came to be led beyond her special field of research into a comparative study of the early civilizations of the Old World; and how she traced the origin of the swastika, in Mexico, to an astronomical source and, in all countries alike, found its use as a sacred symbol accompanied by evidences of a certain phase of culture based on pole-star worship, and the recognition of the fixed laws of nature, which found expression in the ideal of celestial kingdoms or states organized on a set numerical plan and regulated by the apparent revolutions of circumpolar constellations.

The results of the author's researches seem to justify her summary of conclusions; but she distinctly states that she does not wish to propound any theory. She invites further study and discussion by Orientalists and Americanists before drawing final conclusions from the facts she has gathered. The publication of this paper will open anew the consideration of pre-Columbian visits to the New World, shown, as many have believed, by identities too many and too close to be considered as mere resemblances or as the natural results of independent intellectual development.

The illustrations are nearly all from drawings by the author. The analytical Index has been prepared by Miss Mead. It will be seen, by the numbering at the bottom of each page, that it was at first intended to include this paper in Volume I of the Archaeological and Ethnological Papers of the Museum; but the addition of the text relating to the Old World made too bulky a volume, and it is therefore issued as Volume II of the series.

To Mrs. Nuttall for the gift of her work, the results of years of research, and to the several generous friends who have provided the means for publishing this volume, the editor expresses his gratitude in behalf of the Museum.

F. W. PUTNAM, Curator of the Peabody Museum. Harvard University, March 1, 1901.

AUTHOR'S PREFACE.

In February, 1898, while engaged upon the translation and commentary of the anonymous Hispano Mexican MS. of the Biblioteca Nazionale Centrale Library, of Florence, my interest was suddenly and unexpectedly diverted from my self-imposed task by the circumstances described in the opening pages of the present publication.

Laying my work aside, as I then supposed, for a few days only, I seized the new thread of investigation with a keen and enthusiastic interest, little knowing that it, in turn, was not only to hold me fast for nearly three years, but was to lead me out of my original field of research, into distant, and to me, hitherto untrodden realms, in close pursuit of facts relating to the oldest forms of religion, social organization, and symbolism.

The first portion of the present publication was planned as a short monograph of forty-one pages, treating of the origin of the native swastika or cross symbols, and was written in July, 1898, its outcome being the unforeseen conclusion that the cosmical conceptions of the ancient Mexicans were identical with those of the Zuñis. I next traced the same fundamental set of ideas in Yucatan, Central America and Peru and formed the wish to add this investigation to the preceding. The result has been the portion of the work extending from page 41, paragraph 2, to page 284, which was printed in 1899.

Having once launched into a course of comparative research, the deep interest I have always taken in the question of Asiatic contact led me to carry my investigation of the same subject into China. It then seemed impossible not to extend researches from Eastern to Western Asia, and from Asia Minor to Egypt, Greece, Rome and Western Europe. It is in this unpremeditated way that the scope of the present investigation enlarged itself of its own accord, for the simple reason that the most interesting and precious facts fell into my way as I advanced and all I had to do was to pick them up and add them to my collection of evidence.

One serious disadvantage, arising from the circumstance that the present investigation has been in press for nearly three years, is my inability to make any alteration, amendment, or addition, in the earlier portions, which stand as written at different times. It is a matter of regret to me that I was not acquainted with O'Neil's "Night of the Gods" and Hewitt's "Ruling Races of Prehistoric Times," at an earlier stage of my investigation, as through them my publication would have been enriched by many valuable additions which I could have incorporated in the body of my work without unduly sacrificing its unity of form.

In the line of Maya investigation notable advances have been made since I wrote (on page 221), about the "septenary set of signs" described by Mr. A. P. Maudslay in 1886, and about the inscription on the tablet of the Temple of the Cross at Palenque (pp. 237-39). Since that time an important publication on the Tablet of the Cross, to which I should have liked to refer, has been issued by the much esteemed Nestor of Maya investigations, Herr Geheimrath Dr. Förstemann. My attention has also been drawn by the best versed of American students of the Maya Codices, Mr. Charles P. Bowditch, to the fact that Mr. Maudslay now recognizes the general recurrence of an eighth sign in combination with the septenary group, causing this to consist of an initial glyph, followed by seven instead of six signs. Referring the reader to pp. 221 and 222, I point out that the employment of an initial glyph, representing the synopsis of a whole, followed by seven signs, appears even more strongly to corroborate my view that the inhabitants of Copan were acquainted with the septenary, cosmical division I have traced.

My fellow archaeologists will understand the disadvantage of issuing an investigation partly written a few years previously, and will realize that, had I, at the outset, been in possession of all the facts I have since learned, the present work would have been very differently planned and executed. On the other hand, as it partakes somewhat of the nature of a log-book, the reader is able to follow closely my blundering course, and will recognize and appreciate some of its perils and difficulties. It being, unfortunately, impossible to re-write the book. I shall have to be resigned to incur some criticism and blame for omissions, which could have been averted. I shall, however, be content if my prolonged study of ancient Mexican archaeology and the present research open out new lines of investigation, and conclusively prove that primitive cross-symbols and the swastika are universally accompanied by vestiges of a certain set of cosmical conceptions and schemes of organization, which can be traced back to an original pole-star worship. I can but think that the material I have collected will also lead to a recognition that the rôle of the Phœnicians, as intermediaries of ancient civilization, was greater than has been supposed, and that it is imperative that future research be devoted to a fresh study and examination of those indications which appear to show that America must have been intermittently colonized by the intermediation of Mediterranean seafarers.

To me the most interesting result of the present investigation is the fact that, having once started on an unpremeditated course of study, I found an unsuspected wealth of material and finally attained one main, totally undreamed-of conclusion, concerning the law

governing the evolution of religion and civilization. This leads me to think that, as I groped in darkness, searching for light, I unwittingly struck the true key-note of that great universal theme which humanity, with a growing perception of existing, universal harmony, has ever been striving to seize and incorporate into their lives. The fact that many of the transcriptions of the original harmony have been and are discordant, and that they temporarily obscure, instead of rendering, its sublime grandeur, unity and noble simplicity, appears as the inevitable result of the mental activity, ingenuity and creative imagination to which mankind also owes its intellectual and spiritual progress.

In conclusion I regret my inability to express adequately my grateful appreciation of the unfailing loyalty of those true friends, in particular Prof. F. W. Putnam, who, trusting in the earnestness of my purpose and endeavor, have constantly encouraged and cheered me as they patiently awaited the long-delayed completion of my work.

Z. N. CAMBRIDGE, MASS., DECEMBER 31, 1900.

THE FUNDAMENTAL PRINCIPLES OF OLD AND NEW WORLD CIVILIZATIONS.

One evening, in February, 1898, I left my desk and, stepping to the window, looked out at Polaris and the circumpolar region of the sky, with a newly awakened and eager interest.

For thirteen years I had been studying and collecting material with the hope of obtaining some understanding of the calendar, religion and cosmogony of the ancient Mexicans, but had hitherto purposely refrained from formulating or expressing any conclusions on the latter subjects having felt unable to extract a clear and satisfactory understanding of the native beliefs from the chaotic mass of accumulated data under which they lay like the ruin of an ancient temple. Though frequently discouraged, I had, however, never ceased to pursue my research and to note carefully the slightest indication or suggestion which might prove of ultimate value. Becoming utterly absorbed in the collection of such notes, I found no time to publish anything during the past four years, though realizing, with regret, that those interested in my work might be disappointed at my delay in issuing the papers announced, in 1894, as speedily forthcoming. Slowly but steadily, however, I was gaining ground. Various excursions along new lines of research increased my experience and, in crossing and re-crossing the field of ancient Mexico, I frequently had occasion to observe certain familiar landmarks, from a new point of view, and illuminated by rays of fresh light proceeding from recently acquired sources. It was remarkable how often facts, which had seemed so hopelessly complicated, finally appeared to be quite simple and comprehensible. This was noticeably the case with the Aztec deities which, for years, had seemed to me as numberless. After closely studying their respective symbols, attributes and names, during several consecutive months, and subjecting them to a final minute analysis, I found that their number dwindled in a remarkable way and also verified the truth of the statement made by the anonymous author of the Biblioteca Nazionale manuscript which I was editing, that the Mexicans painted one and the same god under a different aspect “with different colours,” according to the various names they gave him in each instance.

It was particularly interesting to find that, in assuming that certain names designated different native deities, the early Spanish writers had committed a mistake as great as though someone, reading the litany of the Virgin in a Catholic prayer-book, for the first time, inferred that it was a series of invocations addressed to distinct divinities, amongst whom figured the “morning star,” a “mirror of justice,” and a “mystical rose,” etc. An examination of the texts of several native prayers preserved, established that the Mexicans addressed their prayers to a supreme Creator and ruler, whom they termed “invisible, incomprehensible and impalpable,” and revered as “the father and mother of all.” Some of their so-called idols were, after all, either attempts to represent in objective form, the attributes of the divine power, the forces of nature, the elements, etc., or rebus figures. As these “gods” or “idols” are enumerated farther on and are exhaustively treated in my commentary of the Biblioteca Nazionale manuscript, now in press, it suffices for my present purpose merely to mention here that the most mysterious figure of Mexican cosmogony, Tezcatlipoca, whose symbolical name literally means “shining mirror,” proved to be identical with Mictlantecuhtli, the lord of the underworld, whose title may also be interpreted as “the ruler or regent of the North,” since Mictlampa is the name of this cardinal point.

The Codex Fuenleal (Anales del Museo Nacional, Mexico, tomo II, p. 88) preserves an important myth relating how Tezcatlipoca, after having been the sun, was cast down from this supreme position by Huitzilopochtli, “descended to the water,” but had arisen again in the shape of an ocelot, and transformed himself into the constellation of Ursa Major.

According to Sahagun the native name of this star-group was Citlal-Colotl or “star scorpion.” Reference to Nahuatl dictionaries revealed that this insect had doubtlessly been named colotl on account of its habit of recurving its tail when enraged.

The Nahuatl verb coloa means, to bend over or twist something, the adjective coltic is applied to something bent over or recurved. The noun colotli, which is almost identical with colotl, means “the cross-beams, the mounting, branch or handle of a cross” (“armadura de manga de cruz.” See Molina’s dictionary).

The above facts show that the idea underlying the name for Ursa Major is primarily that of “something bent over or recurved.” It is obvious that the form of the constellation answers to this description. It is, moreover, extremely significant to find, in the Maya language also, a certain resemblance between the words for scorpion and for a cross. This, in Maya, is zin-che and that for a scorpion is zin-au. The above data justify the induction that the native conception of a cross was connected with the idea of its arms being bent over or recurved, as in the Mexican calendar-swastika.

It is important to find the scorpion figured as one of several symbols of Mictlantecuhtli, the lord of the North, in his sculptured effigy preserved at the National Museum of Mexico (fig. 19).

It is more significant that the verb coloa, besides meaning “to bend over or twist something,” also expressed the action “of describing or performing a circle by walking around something.” Now this is precisely what Tezcatlipoca (the Ursa Major) is represented as doing on page 77 of the B.N. manuscript, since he figures there, surrounded by a circle of footsteps. I could but note that this fact showed that the name of Colotl, applied to the constellation, was not incompatible with its identification with Tezcatlipoca. Once my attention had been drawn to the action of walking, performed by this god, I naturally considered, with fresh interest, the peculiar fact that he is usually represented with one foot only. The circumstances under which he had been deprived of this member are set forth in several of the Codices wherein we see that, after he “descended to the water,” he had an encounter with an alligator, who had viciously bitten off his foot and carried it away. (See Féjérvary Codex, pp. 3 and 74. Vatican, II, p. 74.) Pictures representing Tezcatlipoca, after this event, display the broken end of the tibia exposed and the transverse section of the bone forming a ring, usually painted either white or red. Special pains seem to have been taken to accentuate the hollowness of the bone ring, since its centre is usually painted blue, the symbolical color of air, and conventionalized puffs of breath or air are shown as issuing from it (fig. 1). In some cases, as on the sculptured monolith called “the Stone of Tizoc,” these symbols of breath, issuing from the broken tibia, are figured in such a way that modern writers, ignoring what they were meant to represent, were led to identify them as some animal’s tail attached to the foot of the deity. The hollow circle and puffs of air, constantly associated with the god, frequently figure as his ear ornament when his broken tibia is concealed (fig. 2, no. 3). Besides certain fanciful interpretations which have been given to this symbol, it has been explained as being a hieroglyph conveying the name Tezcatlipoca, and consisting of an obsidian mirror=tezcatl, and smoke=poctli. A possible objection to this assertion might be that in Mexican pictography, the mirror is invariably represented as jet-black, in a white or red frame. In the Codex Telleriano Remensis, a combination of symbols (of water, fire and a serpent) are figured as issuing from the base of the bone (fig. 1, nos. 5, 6). Having taken particular pains to collect all representations of the footless god, I was specially interested in one (Féjérvary, p. 1) in which he is figured as standing on the cross-shaped symbol ollin, the accepted meaning of which is Four Movements. The most remarkable and puzzling picture I found, however, is that (fig. 1, no. 2) in which the jaws of a tecpatl, the symbol of the North, are represented as holding one of Tezcatlipoca’s ankles in a tight grip and practically fastening him thus to the centre of a diagonal cross. In this and other pictures (Codex Féjérvary, 41, 43 and 96) it is obvious that the artists had endeavored to convey the idea of a person permanently attached to one spot by one foot. The only form of locomotion possible to him would be to describe a circle by hobbling on one foot around the other, which would serve as an axis or pivot. The association of this peculiarity with the symbols of the North impressed me deeply and involuntarily caused me to think of a title bestowed in the Codex Fuenleal upon the supreme divinity, namely, “The Wheel of the Winds;” as well as of an expression employed by Tezozomoc (Cronica, p. 574). Referring to the constellations revered by the natives, he mentions “the North and its wheel.”

[Illustration.]

Figure 1

Realizing that some definite and important meaning must underlie the remarkable representations of Tezcatlipoca, I resorted to all possible means to gain an understanding of them. Referring to Nahuatl dictionaries, I found a variety of synonymous names for a person who limped or was lame or maimed. Amongst them was Popoztequi from poztequi, the verb, “to break a leg.” Other names were xopuztequi, xotemol and Icxipuztequi (icxitl=foot). The latter name happened to be familiar to me, for the commentator of the Vatican Codex, Padre Rios, gives it as the name of a god and translates it as “the lame devil.” He records it immediately after Mictlantecuhtli, the lord of the North, and designates it as the name of one of the four principal and primitive gods of the Mexicans.

The commentator of the Telleriano-Remensis Codex, moreover, records that these four gods were “said to have been stars and had fallen from the heavens. At the present time there are stars in the firmament named after them” (Kingsborough, vol. v, pp. 132 and 162).

Other synonymous terms for lame persons were icxinecuiltic and xonecuiltic. Tzimpuztequi, on the other hand, besides meaning lame, also signified something crooked, bent or incurvated. The second name furnished me with an important clue, for Sahagun distinctly records that the native name for the constellation Ursa Minor was Xonecuilli and that it was figured as an S (Historia, l. VII, cap. 3). Besides, the Academia MS. of his monumental work contains the native drawing of this star-group reproduced as fig. 16, no. 1. He also states that S-shaped loaves of bread named xonecuilli were made at a certain festival in honor of this constellation, while the B.N. MS. records that a peculiar recurved weapon, figured in the hands of deities, was named xonequitl (fig. 16, nos. 2 and 3).

The above data furnished me with indisputable evidence of the existence, in ancient Mexico, of a species of star cult connected with the circumpolar constellations and with Tezcatlipoca, the lord of the North, the central figure of the native cosmogony. It was puzzling to find this god connected not only with the Ursa Major but also with Ursa Minor, but an indication suggesting a possible explanation or reconciliation of these apparent inconsistencies is furnished by the descriptions of the strange ritual performance, which was annually repeated at the festival Tlacaxipehualiztli and was evidently the dramatization of a sacred myth.

As an illustration and a description of this rite are contained in the B.N. MS. and the subject is fully treated in my commentary, I shall but allude here to its salient features. It represented a mortal combat between a prisoner, attached by a short piece of cord to the centre of a large circular stone, and five warriors, who fought him singly. The fifth, who was masked as an ocelot and always obtained victory in the unequal contest, fought with his left hand, being “left-handed,” a peculiarity ascribed to Huitzilopochtli. It was he who subsequently wore the skin of the flayed victim, an action which obviously symbolized a metamorphosis. One point is obvious: this drama exhibits the victor as a warrior who was able to circumscribe the stone freely and was masked as an ocelot—Tezcatlipoca—the Ursa Major, but was endowed, at the same time, with the left-handedness identified with Huitzilopochtli. This mythical personage vanquishes and actually wears the skin of the man attached to the stone; becomes his embodiment, in point of fact, and obtains the supremacy for which he had fought so desperately. In the light shed by the Codex Fuenleal, before cited, it was easy to see that the entire performance dramatized the mythical combat between Tezcatlipoca and Huitzilopochtli for the position of the ruling power, in the heavens—the sun. At the same time it was decidedly puzzling to find celestial supremacy personified by a man, firmly fastened to one spot, the centre of a stone circle. It was impossible not to perceive the identity of thought underlying the representation of this prisoner and the pictures of Tezcatlipoca, the one-footed or lame god—Xonecuilli the Ursa Minor. It was moreover of extreme interest to note the existence of traditional records, preserved in the native myths, of changes in the relative positions of celestial bodies and of the Ursa Major in particular.

Whilst dwelling upon the striking analogy existing between the representations of Tezcatlipoca held fast by the symbol of the North and the prisoner attached to what is described either as “a temalacatl, stone whorl” or “an image of the sun,” my gaze fell on a small model of the calendar-stone of Mexico, hanging above my desk, and rested on the symbol Ollin in its centre. The learned director of the National Museum of Mexico, Señor Troncoso (Anales del Museo Nacional, vol. II), had expressed his view that this symbol was an actual figurative representation of the annual apparent movements of the sun, and recorded its positions at the solstitial and equinoctial periods. I had, moreover, submitted a drawing of this same figure to the eminent English astronomer, Prof. Norman Lockyer, and he had corroborated this view and established its correctness. On the other hand, I had long noted that the _Ollin_ was usually figured with an eye, the symbol for star, in its centre (fig. 2, nos. 1, 3), and had also paid particular attention to the fact that the Mexicans had conceived the ideas of two suns, a young day sun and an ancient night or black sun. In the B. N. MS., on the mantas worn at their respective festivals, the day sun is depicted in a somewhat fanciful manner, in blue and red on a white field. The black sun is, however, represented in classical style, so to speak, as on the sculptured calendar-stone, with four larger and four smaller V-shaped rays issuing from it. In this connection it is well to recall here that the Mexicans had no specific name for the sun, beyond _Tonatiuh_, which merely means “that which sheds light” and could equally apply to the stars. In the picture-writings the image of the sun was employed to convey the word _Teotl_. But we find that this word, assumed to be equivalent to their “Dios” by the Spaniards, was also a reverential title bestowed upon chieftains and superiors and was constantly employed in the composition of words to signify something divine, supremely beautiful, etc. Whilst I was pondering on the possibility that the symbol _Ollin_ might have represented the movements of the luminaries of night as well as the orb of day, my attention became fixed upon the four numerals in each of the ends of the symbol and I was struck by a certain resemblance between their positions and those of the four stars which form the body of the bear in the constellation of Ursa Major. It was then that it occurred to me, as mentioned in the

opening sentence of this introduction, to look at the familiar constellations, with a view to verifying the resemblance noted above. As my gaze sought “the pointers” in Ursa Major, and then mechanically turned to Polaris, I thought of some passages I had recently re-read, in Professor Lockyer’s Dawn of Astronomy, realizing that his observations, dealing with the latitude 26° (taking Thebes as representing Egypt), could equally apply to Mexico as this country stretches from latitude 15° to 31°.

[Illustration.]

Figure 2

“The moment primitive man began to observe anything, he must have taken note of the stars, and as soon as he began to talk about them he must have started by defining, in some way or other, the particular star he meant.... Observers would first consider the brightest stars and separate them from the dimmer ones; they would then discuss the stars which never set (the circumpolar constellations) and separate them from those which did rise and set. Then they would naturally, in a northern clime, choose out the constellation of the Great Bear or Orion, and for small groups, the Pleiades (_op. cit._ p. 132).... A few years’ observation would have appeared to demonstrate the absolute changelessness of the places of the rising and setting of the same stars. It is true that this result would have been found to be erroneous when a long period of time had elapsed and when observation became more accurate, but for hundreds of years the stars would certainly appear to represent fixity, while the movements of the sun, moon and planets would seem to be bound by no law ... would appear erratic, so long as the order of their movements was not known.”

The reflection that Ursa Major was probably the first constellation which made any deep impression upon the mind of prehistoric man in America, as elsewhere, lent an additional interest to the star-group, as I concentrated my mind upon its form and endeavored to imagine it in four equidistant positions, corresponding to the numerals in the symbol _Ollin_ of the calendar-stone of Mexico (fig. 2, no. 2).

I succeeded in obtaining, in succession, mental images of the constellation in four opposite positions. This effort led to an unforeseen result which surprised me. In a flash of mental vision I perceived a quadrupled image of the entire constellation, standing out in scintillating brilliancy from the intense darkness of the wintry sky (fig. 3, no. 3). At the same moment I saw that it bore the semblance of a symmetrical swastika of giant proportions. This fact, so unexpectedly realized, gave rise to such an absorbing train of new ideas and interpretations of the data I had accumulated, that I left my window, on that memorable night, with a growing perception of the deep and powerful influence the prolonged observation of Polaris and the circumpolar constellations would naturally have exerted upon the mind of primitive man. Deeply impressed with the striking resemblance between the composite image of Polaris, Ursa Major, and certain forms of the swastika, I started on a fresh line of investigation, and devoted myself to the study of primitive astronomy and its influence upon the intellectual development of mankind in general and the American races in particular. After having worked, during thirteen years, without any preconceived ideas about the ancient Mexican civilization and without formulating any general conclusion concerning it, I saw all the knowledge I had slowly acquired fall into rank and file and organize itself into a simple and harmonious whole.

[Illustration.]

Figure 3

Realizing this I perceived how, with the origin of the swastika, I had found the origin of the set of primeval ideas which had governed the human race from its infancy and which, in Mexican and Central American civilizations, ultimately developed into their ingenious system of government and social organization.

Plate II. Various Forms of the Swastika.

[Illustration.]

Figure 4

The sequel to the above episode was that, with the aid of my movable star-chart, I made the following notes of the apparent positions of the circumpolar constellations at the times of sunrise, midnight and sunset, choosing the periods of the solstices and equinoxes in order to obtain an exact division of the year (pl. I). Whilst studying these I realized that the midnight position was the only stable one, since the actual visibility of the constellations before dawn and after dusk would be subject to considerable variation, according to seasons, latitudes and atmospherical conditions. Having noted these positions, I next combined them separately, obtaining the remarkable results given in fig. 4. The combined midnight positions of the Ursa Major or Minor, at the four divisions of the year, yielded symmetrical swastikas, the forms of which were identical with the different types of swastika or cross-symbols (the normal, ogee and volute, etc.), which have come down to us from remote antiquity and are reproduced here for comparison (pl. II, _a-f_). Reflection showed me that such composite pictures of the Ursa constellations constituted an exact record of their annual rotation, and afforded a perfect sign for the period of a year. I moreover perceived how the association of rotatory motion with the advance of time, and its division into fixed periods or cycles, would be the natural outcome of the recognition of the annual rotation of the star-groups.

The Calendar-Swastika, or cross of ancient Mexico (pl. II, _g_) constitutes an absolute proof of the native association of the cross-symbol with the ideas of rotatory motion and the progress of time, and furnishes an indication that, in an analogous manner, the swastika may have been primarily and generally employed by primitive races, as a sign for a year or cycle. A close scrutiny of the respective forms of the crosses yielded by Ursæ Major and Minor shows that the normal swastika and suavastika may be explained as the separate representations of the two constellations—the angular break in the outline of Ursa Major suggesting the direction of the bend to the right of the arms of the normal swastika, whilst the form of Ursa Minor obviously suggests the bend to the left which is characteristic of the suavastika.

[Illustration.]

Figure 5

My growing conviction that the Bear constellations had furnished the archetype of the different forms of swastika and cross-symbols, found subsequent support when I referred to the map showing the geographical distribution of the ancient symbol published by Prof. Thomas Wilson in his valuable and comprehensive monograph on the subject,(1) to which I am indebted for much information and several illustrations (pl. II, _a-f_, etc.). The map, reproduced here (fig. 5), proves that, with two exceptions, which can be attributed to a migration southward, the employment of the swastika has been confined to the northern hemisphere, _i. e._, precisely to that portion of our globe from which the circumpolar constellations are visible.

[Illustration.]

Figure 6. Star-Map, Representing The Precessional Movement Of The Celestial Pole From The Year 4000 B.C. To The Year 2000 A.D. (_From Piazzi Smyth_.)

The interesting possibility of being able to determine, approximately, the date in the world’s history when the swastika began to be employed as a symbol, next occurred to me. Piazzi Smyth’s star-map, discussed and reproduced in Professor Lockyer’s work already cited (fig. 6), illustrates the changes of direction of the earth’s axis in space, which gives rise to what is called the precession of the equinoxes and has a cycle of something like 25,000 or 26,000 years. Reference to this star-map (fig. 6) proved that the observations, leading to the adoption of the swastika as a symbol, could not possibly have been made until after Ursa Major had become circumpolar, about 4,000 B.C. At that period, when Draconis was the pole-star, the circle described about it by Ursa Major was considerably closer than it is at present. The accompanying illustrations (fig. 7), subject to correction, demonstrate the relative distance of the constellation about 2,770 B.C., 1,800 B.C., and 2,000 A.D., and show how much more strikingly impressive the polar region of the heavens was in remote antiquity.

[Illustration.]

Figure 7.

Let us now briefly review some of the ideas which would naturally suggest themselves to the mind of the primitive observer, after he had recognized the apparent immovability of the polar-star, concentrated his attention upon this feature, and contrasted it with the varying motions of all other celestial bodies in general and with the rotation of the circumpolar star-groups in particular.

This recognition would lead to his gradually learning to utilize Polaris as a means of ascertaining direction. His appreciation of valuable guidance rendered in perilous wanderings would develop feelings of trust, dependence and gratitude towards the one changeless star which permanently rendered valuable services and under whose guidance difficult and essential nocturnal expeditions could be safely undertaken. Superiority and, eventually, extensive supernatural power would more and more be attributed to it, as knowledge was gained of the laws of motion from which it alone seemed to be exempt. This exemption would cause it to be viewed as superior to all other heavenly bodies and even to the sun, and it is easy to see how this idea, becoming predominant, might cause the cult of the pole-star to disestablish an organized sun-cult amongst some tribes. Historical evidence, to which I shall revert more fully proves, indeed, that a native American ruler and reformer actually employed the following reasoning in order to convert his council and people from the worship of the sun to that of a superior divinity which could have been no other but Polaris: “It is not possible that the sun should be the God who created all things, for if so he would sometimes rest and light up the whole world from one spot. Thus it cannot be otherwise but that there is someone who directs him and this truly is the true Creator.”

These words shed a whole flood of light upon primitive religious ideas at an early stage of development. They prove that the association of repose and immovability with the supreme power signified a radical change of thought, based upon prolonged astronomical observation, and indicated intellectual advancement. Attempts to render the new idea objective, to express it and impress it upon the multitude, would naturally end in the production of images of the supernatural power, representing or typifying immovability, changelessness, strength combined with absolute repose.

It is thus rendered evident what a deep significance may be embodied in the rudest images of supernatural beings in attitudes of repose, since a prolonged course of astronomical observation and reasoning may have preceded their production.

Simultaneously with the recognition of Polaris as an immutable centre of axial energy, the rotatory movement of Ursa Major must have excited interest and observation. It was inevitable that star-gazers should gradually recognize a constant agreement between certain positions of Ursa Major and Cassiopeia after dusk for instance, and the annual recurrence of rain, verdure and bountiful food-supplies.

The members of a tribe who, more observant than others, had learned to associate certain positions of these constellations with the seasons and, as a consequence, were able to decide when expeditions to distant localities, in quest of game or fruit, might be successfully undertaken, would naturally assume leadership and command obedience and respect.

The sense of responsibility, superiority and, possibly, rivalry would act upon such individuals as a powerful incentive to further observation and thought and it is evident that, as their mental faculties expanded and one generation transmitted its store of accumulated knowledge to the next, a regular caste of astronomer-leaders would develop, with a tendency to conceal the secrets of their power from the ignorant majority. A broken line, carved on a rock by one of these primitive observers, would have constituted a valuable secret note of the position of Ursa Major on a memorable occasion and would be looked upon as a mystic or magical sign by the uninitiated. A series of such inscriptions might represent the store of astronomical knowledge accumulated by several generations of observers, and it is interesting to recognize that such astronomical records as these were probably the first which men were impelled to perpetuate in a lasting form; since it was absolutely necessary that they should be permanently available for reference at prolonged intervals of time. What is more, the mere fact of being obliged to refer to these inscriptions would cause the astronomers to reside permanently in one locality. The habit of consulting the prophet or oracle before undertaking important steps, involving the welfare of the tribe, would gradually cause the rocks or cavern in which he resided to be invested with a certain sacredness.

It is thus evident that the first men, who rudely scratched the outline of Ursa Major or Minor on a rock, took what was probably one of the most momentous steps in the history of the human race, and it is easy to see how a variety of combinations of circumstances would have led many men, in widely-separated localities and at different periods of the world’s history, to perform precisely the same action. In some cases, under favorable surroundings, the rudimentary attempt would mark the starting point for a long line of patient observation and study, which would inevitably lead to the creation of centres of intellectual growth, to the association of the different positions of the constellation with the seasons and culminate in the habitual employment of a swastika as the sign for a year, or cycle of time.(2)

The idea of rotation, associated with calendar signs and periods, finds its most striking and convincing exemplification in the following description of the ancient Mexican game “of those who fly,” translated from Clavigero (op. et ed. cit. p. 236). This

performance, which furnished a diversion to the Spaniards after the Conquest, had evidently been, originally, connected with religious ideas. “The Indians selected a tall, stout and straight tree, and, lopping off its branches, planted it firmly in the centre of the great square” (which was always situated in the centre of the city and had four roads leading to it from the four quarters). “On the summit they placed a large cylinder of wood, the shape of which was compared by the Spaniards to that of a mortar. Four strong ropes hung from this and supported a square frame composed of four wooden beams. Four other ropes were fastened by one end to the pole itself and wound around it thirteen times. Their loose ends were passed through holes in the middle of each beam and hung from these. Four Indians, masked as eagles or other birds, ascended the pole singly, by means of certain loops of cord, and mounting on the cylinder they performed in this perilous position a few dance-like movements. Each man then attached himself to the loose end of one of the hanging ropes, and then, with a violent jerk and at the same moment, the four men cast themselves into space from their positions on the beams. This simultaneous movement caused the frame and cylinder to revolve and uncoil the ropes to which the men were fastened and these descended to the ground after performing a series of widening circles in the air. Meanwhile a fifth individual, who had mounted the wooden cylinder after the others, stood on this as it revolved, beating a small drum with one hand, whilst he held a banner aloft with the other.” Whilst it is obvious that this peculiar and dangerous performance clearly symbolized axial rotation, typified by the revolving pivot and the four men in aërial motion, its full meaning and intention are only made clear by the following explanation recorded by Clavigero. “The essential point in this game was to calculate so exactly the height of the pole and the length of the ropes, that the men should describe precisely thirteen circles each before reaching the ground, so as to represent the cycle (of 4×13=)52 years.”

This passage constitutes absolute proof that the Mexican Calendar system was intimately associated with axial rotation and ideas such as could only have been derived from observation of Polaris and of the circumpolar constellations. The game itself was a beautiful and well-conceived illustration of the flight of time, typified by the aërial circles performed by the men masked as birds, and of its methodical division into fixed periods.

Leaving the subject of the calendar for the present we must revert to my tables recording the apparent annual and nocturnal axial rotation of the circumpolar constellations.

Whilst studying these the reflection naturally arose, that the people who observed Ursa Major must have paid equal attention to Cassiopeia and noticed that these constellations ever occupied opposite positions to each other as they circled around the pole. Dwelling on the fact that in ancient Mexico Ursa Major was associated with an ocelot, I remembered the many representations in which an ocelot is represented as confronting an eagle, usually in mortal combat. Mexican war-chiefs were classed into two equally honorable grades, designated as the “ocelots and the quauhtlis, _i. e._, eagles.” The constellation of Cassiopeia presents to me, a marked resemblance to the image of a bird with outspread wings, whose head is turned toward Polaris. The fact that when this star-group seems to be above, Ursa Major seems to be below, and _vice versa_, would obviously suggest the idea of an eternal combat between two adversaries who alternately succumbed and resuscitated. It was interesting on reasoning further, to note that once the above idea had taken root it must have been impossible not to associate in course of time, the quadruped and the bird with the elements to which they seemed to pertain, and gradually to conceive the idea of an everlasting antagonism between the powers of the sky and of the earth, or light and darkness, and other opposites which suggested themselves naturally, or were artificially created, by the fertile mind of man. In this connection it should be observed that the mythical adversary of Tezcatlipoca, the ocelot, designated as Ursa Major, is Huitzilopochtli, whose idol, in the Great Temple of Mexico, represented him masked as a hummingbird (see Atlas Duran). The special reason why this bird became associated with the god is explained by the following passage in Gomara (Histoire générale des Indes. Paris, 1584, chap. 96, p. 190): “This bird died, or rather fell asleep in the month of October and remained attached by its feet to a twig. It awakened again in April when the flowers blossomed. For this reason, in the language of the country it is named Huitzitzilin, the resuscitated.” We therefore see that whilst it is stated in the myth that the ocelot arose again after having been cast down from the sky by Huitzilopochtli, the very name of the latter betokened that the bird-god had also only just “resuscitated” from a presumably similar defeat.

[Illustration.]

Figure 8.

As one and the same object may suggest several resemblances at the same time or consecutively, and thus give rise to a group of associations around a single figure, I venture to point out that the zigzag form of Cassiopeia may well have been compared to forked lightning and caused the idea of lightning and thunder to become indissolubly connected with the conception of a great celestial bird. Again there is the possibility that the same star-group may have more strikingly suggested, to other people, the idea

of the winding body of a serpent describing a perpetual circle around a central star. In Mexico, as elsewhere, we find the serpent closely associated with the idea of time. It is represented as encircling the calendar wheel published by Clavigero (fig. 8). Four loops, formed of its body, mark the four divisions of the year. Twin serpents, whose heads and tails almost meet, are sculptured around the famous calendar-stone of Mexico. Four serpents whose bent bodies form a large swastika and whose heads are directed towards a central figure, are represented in the Codex Borgia in association with calendar-signs (fig. 9, _cf._ Féjérvary, p. 24). I shall have occasion to refer in detail to Mexican serpent-symbolism further on.

Meanwhile I would submit the interesting results obtained on combining the positions apparently assumed by the circumpolar constellations during a single night. The tables exhibit four composite groups representing the positions at the solstitial and equinoctial periods (fig. 10).

[Illustration.]

Figure 9.

[Illustration.]

Figure 10.

The night of the winter solstice, the longest of the year, yielded alone a symmetrical figure. It resembled the well-known triskelion, the companion-symbol of the swastika (figs. 10 and 11). Just as this had proved to be the most natural of year symbols, so the triskelion revealed itself as a natural sign of the winter solstice, the period recognized and celebrated by most inhabitants of the northern hemisphere as the turning-point of the year. In a climate like that of Mexico and Central America, however, where the year divided itself naturally into a dry and a rainy season, it is evident that the winter solstice would be less observed and that the ardently-desired recurrence of the rainy season, after a long and trying period of drought, should be regarded as the annual event of utmost importance. Indeed, if carefully looked into, the entire religious cult of these people seems to express but one great struggling cry to the God of Nature for life-giving rain, and a hymn of thanksgiving for the annual, precious, but uncertain gift of water.

[Illustration.]

Figure 11.

To these supplicants the winter solstice betokened little or nothing and it is not surprising to find no proofs of the employment of the triskelion as a sacred symbol in ancient Mexico. On the other hand, it has been traced by Mr. Willoughby on pottery from Arkansas, and in Scandinavia, where the circumpolar constellations have doubtlessly been observed from remote times, and the winter solstice has ever been hailed as the herald of coming spring, the triskelion is often found associated with the swastika.

[Illustration.]

Figure 12.

I am indebted to Prof. Thomas Wilson’s work already cited for the two following illustrations of objects exhibiting this association. The first is a spearhead found in Brandenburg, Germany (fig. 12). The second is a bronze brooch from Scandinavia, to which I shall presently revert (fig. 13). It exhibits, besides the triskelion, swastika and circle, the S-shaped figure which was, as I shall show further on, the sign actually employed by the ancient Mexicans and Mayas as the image of the constellation Ursa Minor, whose outline it indeed effectually reproduces.

Before referring to the Mexican and Maya representations of the star-group, I would next demonstrate that the sacred numbers of Mexico, and of other countries situated in the northern hemisphere, coincide exactly with the number of stars in the circumpolar constellations themselves and in simple combinations of the same.

Ursa Major and Ursa Minor each contains seven stars, and the number seven is the most widely-spread sacred number. Ancient traditions record that the race inhabiting Mexico consisted of seven tribes who traced their separate origins to seven caves, situated in the north. In memory of these, at the time of the Conquest, there were seven places of sacrifice in the city of Mexico. I shall recur to the number seven further on, in discussing the native social organization, and now direct attention to the five stars of Cassiopeia and to the fact that the combination of the stars in this constellation with Polaris and Ursa Major yields the number thirteen. This

result is specially interesting since the entire Calendar-system of Mexico and Yucatan is based on the combination of the numerals 13+7=20, the latter again being 4×5.

[Illustration.]

Figure 13.

On the other hand the same number, 13, is also obtained by the combination of the Ursæ star-groups with Polaris. The number 5 is constantly yielded by Cassiopeia and the four-fold repetitions of the groups supply the suggestion of the number 4. The combination of Ursa Minor and Cassiopeia yields 12. The accompanying figure exhibits swastikas composed of Ursa Minor accompanied by Ursa Major and Cassiopeia separated and combined (fig. 14). I next direct attention to the peculiar difference in the numerical values of the Ursæ swastikas.

In the first, the central star, surrounded by four repetitions of the seven-star constellation, yielded a total of twenty-nine stars—4x5+9. Further combinations will be seen by a glance at the Ursa Major swastika (fig. 4). The analysis of the Ursa Minor swastika is not so simple and occasions a certain perplexity.

When I had first combined the four positions of this constellation, I had, naturally, and without further thought, figured Polaris but once, as the fixed centre, whereas I had repeated the other stars of the compact group four times. It was not until I began to count the stars in the swastika that I realized how I had, unconsciously, made one central star stand for four, and thus deprived the composite group of the numerical value of three stars. On the other hand, if I repeated the entire constellation four times, I obtained a swastika with four repetitions of Polaris in the middle. In this way, however, Polaris became displaced, and the idea of a fixed centre was entirely lost. A third possible method of composing the swastika was to allow one central star for each cross-arm. But this gave two central stars, each of which would represent two stars. Unless enclosed in a circle and considered as a central group by themselves, the four and the two repetitions of Polaris could not convey the idea of a pivot or fixed centre. The three respective numerical values obtained from these experimental combinations were 4×6+1=25, 4×7=28, and finally 2×13 or 4×6+2=26. In each swastika the central star forcibly stood for and represented two or four (fig. 15).

[Illustration.]

Figure 14.

In the triskelions the same perplexity arose: if Polaris was repeated, the idea of a fixed centre was lost (fig. 15); if figured singly, it nevertheless necessarily and inevitably stood as an embodiment of three stars. Reasoning from my own experience, I could but perceive, in the foregoing facts, a fruitful and constant source of mental suggestions, the natural outcome of which would be the association of the central star with an enhanced numerical value, and a familiarity with the idea of one star being an embodiment of two, three or four.

[Illustration.]

Figure 15.

As the evolution of religious thought and symbolism progressed, this idea would obviously lead to the conception of a single being uniting several natures in his person. In this connection it is certainly extremely interesting to find the serpent associated with the Calendar in Mexico and Yucatan, its Nahuatl name being homonymous for twin, _i. e._ two, and the Maya for serpent, _can_ or _cam_, being homonymous for the number four. The serpent was, therefore, in both countries the most suggestive and appropriate symbol which could possibly have been employed in pictography, to convey the idea of dual or quadruple natures embodied in a single figure.(3) Added to this the circumstance that, to the native mind, the serpent, upon merely shedding its skin, lived again, we can understand why the ancient Mexicans not only employed it as a symbol of an eternal renewal or continuation of time and of life, but also combined it with the idea of fecundity and reproductiveness. In Yucatan where the Maya for serpent, _can_, is almost homonymous with _caan_=sky or heaven and the adjective _caanlil_=celestial, divine, the idea of a divine or celestial serpent would naturally suggest itself. It is therefore not surprising to find, in both countries, the name of _serpent_ bestowed as a title upon a supreme, celestial embodiment of the forces of nature and its image employed to express this association in objective form. In Yucatan one of the surnames of Itzamná, the supreme divinity, was Canil, a name clearly related to _caanlil_=divine and _can_=serpent.

In Mexico the duality and generative force implied by the word “coatl” are clearly recognizable in the native invocations addressed to “Our lord Quetzalcoatl the Creator and Maker or Former, who dwells in heaven and is the lord of the earth [Tlaltecuhtli]; who is our celestial father and mother, great lord and great lady, whose title is Ome-Tecuhtli [literally, two-lord=twin lord] and Ome-Cihuatl [literally, two-lady=twin lady”] (Sahagun, book VI, chaps. 25, 32 and 34).

The following data will suffice to render it quite clear that the Mexicans and Mayas employed the serpent as an expressive symbol merely, signifying the generative force of the Creator to whom alone they rendered homage. It is no less an authority than Friar Bartholomew de las Casas who maintained that “in many parts of the [American] Continent, the natives had a particular knowledge of the true God; they believed that He created the Universe and was its Lord and governed it. And it was to Him they addressed their sacrifices, their cult and homage, in their necessities...” (Historia Apologetica, chap. 121).

Friar Bartholomew specially adds that this was the case in Mexico according to the authority of Spanish missionaries and no one can doubt that this was the case when they read that in the native invocations, preserved by Sahagun, the supreme divinity is described as “invisible and intangible, like the air, like the darkness of night,” or as the “lord who is always present in all places, who is [as impenetrable as] an abyss, who is named the wind [air or breath] and the night.” “All things obey him, the order of the universe depends upon his will—he is the creator, sustainer, the omnipotent and omniscient.” He is termed “the father and mother of all,” “the great god and the great goddess,” “our lord and protector who is most powerful and most humane,”—“our lord in whose power it is to bestow all contentment, sweetness, happiness, wealth and prosperity, because thou alone art the lord of all things.” One prayer concludes thus: “Live and reign forever in all peace and repose thou who art our lord, our shelter, our comfort, who art most kind, most bountiful, invisible and impalpable!” (Sahagun, book VI, on the rhetoric, moral philosophy and theology of the Mexicans, chaps. 1-40). It is related that, in gratitude for the birth of a son, the ruler of Texcoco, Nezahual-coyotl erected a temple to the Unknown God.... It consisted of nine stories, to symbolize the nine heavens. The exterior of the tenth, which formed the top of the nine other stories, was painted black with stars. Its interior was encrusted with gold, precious stones and feathers and held “the said god, who was unknown, unseen, shapeless and formless” (Ixtlilxochitl, Historia Chichimeca ed. Chavero, p. 227; see also p. 244). A passage in Sahagun (book VI, chap. VII) states that “the invisible and imageless god of the Chichimecs was named Yoalli-ehecatl [literally, night-air or wind], which means the invisible and impalpable god ... by whose virtue all live, who directs by merely exerting his wisdom and will.” In the Codex Fuenleal (chap. 1) the remarkable title of “wheel of the winds=Yahualliehecatl,” is recorded as “another name for Quetzalcoatl.” This undeniably proves that the Mexicans not only figured the Deity by the image of a serpent but also thought of him as a wheel which obviously symbolized centrical force, rotation, lordship over the four quarters, _i. e._, universal rulership.

[Illustration.]

Figure 16.

Returning from these ideas of later development to the primitive source of their suggestion, let us now examine the native picture of Xonecuilli, Ursa Minor, preserved in the unpublished Academia MS. of Sahagun’s Historia, in Madrid (fig. 16, no. 1). It is an exact representation of the star-group. The fact that the seven stars are figured of the same size in accurate relation to each other, either proves that the eyesight of the native astronomers was extremely keen and their atmosphere remarkably clear, or that possibly, the minor stars of the group were more brilliant in ancient times, than they are now. Astronomers tell us, for instance, that as late as the seventeenth century the star in the body of Ursa Major nearest to the tail, was as bright as the others, while it is now of the fourth magnitude only.

It must be admitted that the shape of the constellation resembles an S. An SS sign is mentioned by Sahagun (Historia, book VIII, chap. 8) as occurring frequently, as a symbolical design on native textile fabrics. It figures as such, in the black garments of the female consort of Mictlantecuhtli in the Vienna Codex, pp. 23 and 33. He denounces it as suspect and hints that it was intimately connected with the ancient religion.

S-shaped sacred cakes, called Xonecuilli, were made during the feast of Macuilxochitl=five flowers, and are figured (fig. 16, no. 2) in the B. N. MS. (p. 69) with a four-cornered cross-shaped cake of a peculiar form (fig. 20, III), which is found associated with five dots or circles in the Codices and also with the Tecpatl-symbol of the North (fig. 20, I and II).

A recurved staff, which is held in the hand of a deity in the B. N. MS. is designated in the text as a _xonoquitl_ (fig. 16, no. 3). Amongst the insignia of the “gods,” sent as presents by Montezuma to Cortés upon his landing at Vera Cruz, were three such recurved “sceptres,” the descriptions of which I have collated and translated in my paper on the Atlatl or Spear-thrower of the

Ancient Mexicans (Peabody Museum Papers, vol. 1, no. 3, Cambridge, 1891, p. 22). In this work I presented my reasons for concluding that these recurved sceptres were ceremonial forms of the atlatl. I now perceive that they were endowed with deeper significance and meaning. The Nahuatl text of Sahagun's Laurentian MS. of the Historia de la Conquista (lib. XII, chap. IV) records the name of one of these staffs as "hecaxonecuilli," literally "the curved or bent over, air or wind," and describes it as made of "bent or curved wood, inlaid with stars formed of white jade=chalchihuite." This passage authorizes the conclusion that four representations in the B. N. MS. of black recurved sceptres, exhibiting a series of white dots, are also heca-xonoquitl, inlaid with stars, and that all of these are none other but conventional representations of the constellation Xonecuilli, the Ursa Minor. In each case the deity, carrying the star-image, also displays the ecacozcatl the "jewel of the wind," the well-known symbol of the wind-god. In one of these pictures (p. 50) he not only bears in his hand the star-image, but also exhibits a star-group on his head-dress, consisting of a central-star, on a dark ground, surrounded by a blue ring. Attached to this against a dark ground, six other stars are depicted, making seven in all. In connection with this star-group it is interesting to note that the hieroglyph, designated by Fra Diego de Landa as "the character with which the Mayas began their count of days or calendar and named Hun-Imix," furnishes a case of an identical though inverted group (Relacion de las Cosas de Yucatan, ed. B. de Bourbourg, p. 237). Enclosed in a black ring, the glyph displays, above, a large black dot with six smaller ones grouped in a semicircle about it, and below, four perpendicular bars.

Subject to correction, I am inclined to interpret this glyph as a hieratic sign for the constellation Ursa Minor and its four movements, and to consider it as furnishing a valuable proof of the origin of the Maya Calendar.

The seemingly inappropriate procedure of figuring shining stars by black dots actually furnishes the strongest proof that a star group is thus represented; for, in the Maya language, "ek" is a homonym for star and black, and a black spot was, in consequence, the most expressive sign for a star. This fact affords a valuable explanation of the reason why the ocelot, whose skin is spotted with black, was employed as the figure of the nocturnal sky, and clearly proves that the Mexicans adopted this symbol and its meaning from the Mayas.

[Illustration.]

Figure 17.

We will now revert to the S-shaped sign. Its association with images of star is further exemplified in Mexican Codices. It occurs on the wall of a temple, in combination with symbols for stars and the North-Mictlan, which consist in this case, of skulls and cross-bones (fig. 17, II).

In the Dresden Codex, of Maya origin, there is an extremely important page on which the S-sign occurs in connection with twin deities, besides rain and cross symbols (fig. 17, I). A careful examination of the group shows that one of the seated figures is accompanied by a downpour of water (painted blue in the original), besides the S-symbol which is also repeated above the head of his companion. Higher up, on the same page, the S occurs again in a group of glyphs alongside of twin-seated figures. These, as well as the single-seated form beneath them, have an eye or a large black spot surmounted by dots instead of a head (Vocabulaire de l'écriture hiératique de Yucatan, p. 38). Monsieur Léon de Rosny has identified this figure, which also occurs in the Codex Troano, as the image of the supreme divinity of the Mayas, of whom more anon, one of whose titles was Kin-ich-ahau, literally Sun-eye lord.

A similar sign consisting of the lower half of a human body seated, with a large eye on its knees is repeated several times in the Borgian Codex. This form is also figured as seated in a temple, without the eye-star, but three stars are on the roof and the S-sign is on the lower wall of the building (Borgian Codex, p. 16).

The above facts demonstrate that, in both MSS. derived from different sources, the same association of ideas is expressed.(4) The S sign appears in connection with twin- or single-seated forms, surmounted by a symbol for star. It is unnecessary for me to lay further stress upon the obvious facts: that the only celestial body which could possibly have been associated with a seated form, suggesting repose, was Polaris. It is, moreover, only by assuming that the sign of the seated star represents the stationary pole-star that its combination in the Codices with the S-sign—Xonecuilli—Ursa Minor, can be understood. I likewise draw attention to the possibility that the S, or single representation of the constellation, may well have been employed as a sign for the summer solstice, since, in some localities, during the shortest night of the year, Ursa Minor may have been visible in one position only. Assuming that the triskelion was the sign for the winter solstice we should thus have natural signs for the two nights marking the turning-points of light and darkness in the year.

Reverting to fig. 17, I, from the Codex Dresdenis, I draw attention that it furnishes definite proof that the Mayas associated the idea of the immovable seated star with twin deities and that they connected the S-symbol with cross and rain symbols. A striking combination of the latter symbols is represented under the principal seated figures. It consists of a diagonal cross traversed perpendicularly by a band of blue water.

[Illustration.]

Figure 18.

Further Maya cross-symbols should be cursorily examined here, viz: fig. 18, I, II, III, VI, VII and VIII. They will be found to consist of variations of two fundamental types, often figured alongside of each other and enclosed in a square, or circle. One type consists of two diagonally crossed bars, plain or representing cross bones (I). A rectilinear cross with interlaced circle (II) is also found. The other type exhibits a small cross, square, circle or dot in the centre of the square with a circle in each corner. In some cases these are united by a series of dots to the central circle and thus form a diagonal cross (VI and VIII) which is sometimes figured as contained in a flower with four petals, such as is also found in Mexican symbolism. The diagonal, dotted cross is frequently combined with four pairs of black bars, placed in the middle of each side of the square, pointing towards the centre. Similar pairs of black bars are figured in the B. N. MS. (p. 3) on the manta of Mictlantecuhtli, with stars, around one of his symbols, a spider. They likewise recur on two of several sacrificial papers on p. 69, amongst which one exhibits a diagonal cross, another the S-sign, while others display realistic drawings of stars with six or eight points.

The pairs of bars figure in the hieroglyph designated by Maya scholars as the sign for _Kin_, the sun, which may be seen in the centre of large diagonal cross-symbols in fig. 18, VII, VIII, from the Dresden Codex: The cross, of fig. 18, VII, is composed of two bones and two arrowpoints, a particularly interesting combination considering that in the Maya a bone is _bak_, an arrow is _kab-cheil_ and the name given to the gods of the four quarters “the sustainers of the world,” is _Bakab_. It cannot be denied that the phonetic elements of this name occur in the words for bones and arrows which form the cross, symbolic of the four quarters. In fig. 18, VIII, the cross may be composed of four bones, but of this I am not certain. In both cases, however, the crosses rest on a curious double and parti-colored symbol and are associated with serpent signs, in which the open jaws and teeth are prominent features. It is noteworthy that while “can” or “cam” is the Maya for serpent, the word “camach” means jaw. The figure consisting of the upper jaw only of a serpent, in the left hand corner of the band above, fig. 18, VIII, proves, therefore, to be a cursive phonetic sign for serpent.

The parti-colored symbol combined with the cross obviously signifies a duality, such as light and darkness, the Above and the Below and a series of dualities—possibly the two divisions of the year, the dry and rainy seasons. In Mexico we are authorized by documentary evidence, to give a wider and deeper interpretation to the symbol of duality, for it can be absolutely proven that the Mexican philosophers divided the heavens into two imaginary portions, and respectively identified these with the male and female principles.

In Nahuatl the West was designated as Cihuatlampa, “the place or part of the women.” The souls of the women who had earned immortality were supposed to dwell there, whilst the souls of the men resided in the East. In the appendix to book III of Sahagun’s Historia, it is described how, according to the native belief, the souls of the male warriors hailed the daily appearance of the sun above the eastern horizon, and escorted it to Nepantla, the zenith. Here the souls of the women awaited it and assumed the duty of escorting the sun to the western horizon, the symbol for which was calli=the house. The above passage indicates that the native philosophers imagined across the middle of the sky a line of demarcation, separating the portions of the heaven respectively allotted to the male and female souls. For four years after death these souls retained their human form, and then, after passing through nine successive heavens, entered into the celestial paradise where they assumed the forms of different kinds of butterflies and humming-birds. The names of these are enumerated in the Nahuatl text of Sahagun’s Laurentian MS. (book III).(5) The symbolism of the humming-bird has already been explained by a passage cited from Gomara’s Historia. In this connection it is extremely interesting to find the humming-bird represented in the B. N. MS., as sucking honey from a flower, which is attached by a cord, covered with bird’s down, to a bone, the symbol of death.

This peculiar but expressive group of symbols figures only on the head-dresses of deities wearing certain other symbols, amongst which we find the Eca-cozcatl and Eca-xonequilli the image of Ursa Minor, already described.

The merest indication of the association of a circumpolar constellation with the idea of death (disappearance) and resurrection (re-appearance) is of special interest, since the ancient Mexicans located the Underworld, the “place of the dead,” in the North.

Reflection showed, however, that such an association could only have suggested itself to the minds of star-observers living in southern latitudes, approximate to the equator, or in localities where the northern horizon was more or less shut off from view by intervening mountains. In such places Polaris would appear comparatively close to the boundary-line of the northern sky so that the Ursa constellations and Cassiopeia would be invisible to the local astronomers at midnight during that period of the year when one or the other of the star-groups seemingly stretched between Polaris and the northern horizon. A glance at plate I shows that, at the present time, it is about the period of the autumnal equinox that Ursa Minor would be invisible at midnight, in such localities, while Ursa Major would gradually disappear from view towards midnight, during a certain number of nights, according to latitude and locality, between the autumnal equinox and the winter solstice whilst Cassiopeia would seem to hover above the horizon. The total or partial alternate periodical disappearance of the two most familiar star-groups in the extreme North and their re-appearance after sometimes regular intervals of time could but have made a profound impression upon primitive astronomers and thinkers. Whilst the mere periodical reversal of the positions of Cassiopeia and Ursa Major suggested alternate victory and defeat, the actual though brief and partial disappearance of either star-group must have appeared to be a descent into an under-ground space, associated with darkness and death, followed by a resurrection. In his Cronica, Tezozomoc records, besides Mictlan (the land of the dead), another name for the underworld, Opochcal-ocan, literally, the place of the house to the left. This appellation can only be understood when it is realized that, in a sufficiently southern latitude, an observer, watching the setting of a circumpolar constellation below the horizon, would always see it disappear to his left and subsequently rise to his right. It is evident that in time this fact would give rise to the association of the left with the underworld, the lower region, and the right with the region above. The native idea of a dwelling in the underworld is further demonstrated by the bestowal of the symbol _calli_=house, upon the western horizon below which all heavenly bodies were seen to disappear. A definite connection between the West and one half of the North being thus established, it would naturally result that a corresponding union of the South and East would be thought of in time, and that these quarters would become associated with the rising of celestial bodies, _i. e._, with light, the Above, while the opposite quarters became identified with their setting, _i. e._, with darkness, the Below.

Pausing to review the foregoing conclusions, which I have shown to be the natural and inevitable result of simple but prolonged astronomical studies, observation and plain reasoning, we see that they led to a conception of the Cosmos as divided into seven parts, _i. e._, the fixed Centre, the pivot, primarily suggested by Polaris who was regarded as the creative, generative and ruling power of the universe; the Four Quarters, seemingly ruled by the central force and associated with the elements; the Above and the Below, suggested by the rising and setting of celestial bodies and associated with light and darkness, sky and earth, etc., etc.

Many of my readers will doubtless recognize at once that the above organization of the Cosmos into the Centre or Middle, the Above and the Below, and the Four Quarters, is precisely that which the Zuñi priests taught Mr. Frank Cushing, when they initiated him into their secret beliefs. Other explorers have recorded the same conception amongst different native American tribes and with these proofs that this set of ideas is still held on our Continent at the present time, I point out the fact that the Maya figures (fig. 18, VII and VIII, from the Dresden Codex) become perfectly intelligible only when interpreted as representing the Centre, the Four Quarters, the Above and the Below, the latter figured by the dark and light halves of the dual sign. Furthermore, I can demonstrate that this fundamental set of elementary, abstract ideas, furnishing the first principles of organization, is plainly visible under the surface of the ancient Mexican civilization and can be traced not only in Yucatan and Central America, but also in Peru. In these countries, as I shall show, it assumed an absolute dominion over the minds of the native sages, directly suggesting the forms of government and social organization existing at the time of the Conquest and faintly surviving to the present day. It entirely controlled the development of aboriginal religious cult and philosophical speculations and pervaded not only the native architecture and decorative art, but also all superstitious rites and ceremonies, and entered into the very games and pastimes of the people.

The following table presents the bare outline of the scheme of organization exposed in the preceding text. In making it I have, after due consideration, definitely adopted the assignment of the Mexican symbols and colors to the cardinal points given by Friar Duran in the Calendar-swastika contained in his atlas and reproduced (pl. II, _g_).

Each of these is North; West; South; then East. Symbols: Tecpatl, Flint; Calli, House; Acatl, Cane; Tochtli, Rabbit. Colors: Red; Yellow; Blue; Green. Elements: Fire; Earth; Air; Water. Warmth; Darkness; Breath; Rain.

Together, North and West are The Below, the “female” region. TEZCATLIPOCA=MICTLANTECUHTLI.

South and East are The Above, the “male” region, HUITZILOPOCHTLI.

Combined, they are The Centre. The dual, generative, ruling and directive Force. QUETZALCOATL. The Divine Twin.

Before proceeding to examine more closely the great edifice of human thought which was reared, in the course of centuries, on the ground plan designated above, we must retrace our steps and consider what a deep impression the gradual realization of the changes in the relative positions of Polaris and certain familiar star-groups must have produced upon those who were the first to realize them. Transporting ourselves back to the gray dawn of civilization, let us endeavor to understand the position of the native priest astronomers who, having received and transmitted a set of religious and cosmical ideas, based on the assumption of the absolute and eternal immutability of the centre of the heaven, Polaris, gradually became aware that it also was subject to change, evidently obeyed an unseen higher power and that the ancient order of things, recorded by their predecessors, had actually passed away.

It is obvious that, in all centres of astronomical observation and intellectual culture, a complete revolution of fundamental doctrine or thought must have taken place. A period of painful misgivings and doubt must have been passed through, during which an earnest and anxious observation of all celestial bodies must have seemed imperative and obligatory. Under such circumstances astronomy must have made great strides and astronomical observation become the foremost and highest duty of the intellectual leaders of the native races. Pyramids and temples would be built for the purpose of verifying and recording the positions of sun, moon, planets and stars, and the orientation of these buildings would be carefully planned accordingly. Before obtaining glimpses of the great evolution of religious thought which progressed on our Continent in olden times, it is well to realize, by means of Piazzi Smyth's map (fig. 6) that the world ceased to possess a brilliantly conspicuous, absolutely immovable pole-star for a prolonged period of time, stretching somewhere between 500 B.C. and 1200 A.D.

The ancient native chronicles record that under "divine" leadership great migrations of tribes took place within this period, the purpose of which was to find a locality which fulfilled certain ardently-desired conditions connected with religious cult.

From various centres of civilization in Mexico and Central America we also hear different accounts of how, at different times, small bands of earnest men, under a leader of superior intelligence, bent on a peaceable but unexplained errand, arrived from distant regions and departed for an unknown goal, after delaying just long enough to teach social organization and impart a higher civilization to the tribes encountered on their passage.

These preserved the memory of the _title_ of the leader, in their different languages and he became the culture-hero of their tribe. The fact that, in each case, these sages taught the ignorant tribes the division of time and instituted the calendar, proves that they were skilled in astronomy.

From a sentence uttered by Montezuma to the native astronomers whom he termed "the Sons of the Night," we learn that it was their custom "to climb mountains" so as "to study the stars." When one considers the full import of the problems which had to be faced by these ancient sages, who earnestly endeavored to account for the great changes which had taken place in the heavens, within the memory of man, it seems natural to suppose that many an expedition was undertaken for the purpose of acquiring further astronomical knowledge, of finding, perhaps, the immovable star which had been revered in past ages by the ancestors of the native race.

The cult of Polaris may well have made such expeditions assume the aspect of an imperative religious duty and sacred pilgrimage. As all expeditions across Mexico and Central America would necessarily be limited by the oceans and be fruitless as far as Polaris was concerned, it is obvious that the line of exploration which would be ultimately adopted, would run from south to north and _vice versa_. A small band of enthusiasts, setting forth under the leadership of some of the most advanced thinkers of the time, would undoubtedly have been prepared to devote their entire lives to the object in view. As long as a single member of such an expedition existed, he would be a powerful and active agent in spreading the fundamental set of ideas derived from the observation of Polaris. In lapse of time, by transmission, its influence might travel to a region too remote perhaps for direct contact to have taken place.

If I have indulged in the foregoing line of conjecture and surmise, it is because it is my purpose also to demonstrate, by absolute proof, that the dominion of the above set of ideas extended over Yucatan, Honduras, Guatemala and even reached Peru, where its influence is distinctly visible.

It also extended far to the north in prehistoric times, for certain carved shell-gorgets which have been found in prehistoric graves in Illinois, Missouri and Tennessee exhibit emblems which have definite meanings in the Maya language, spoken in Yucatan.

In order to maintain this assertion I must make a slight digression from the main subject and revert to the myth already cited, recording the casting down from heaven of Tezcatlipoca who arose and ascended again in the form of an ocelot. There are

interesting native pictures of this combat and the fall of the ocelot in the Vatican Codex II, p. 34, the Féjérvary Codex, p. 56, and others equally important, representing the fall or descent of an eagle from the sky, to which I shall revert.

It is moreover recorded by Mendieta (p. 82) that Tezcatlipoca likewise descended or let himself down from the sky by a spider's thread, and in the Bodleian MS. (p. 12) there are two curious pictures one of an ocelot and a cobweb, the other of an ocelot, descending head foremost from stars. The same incident is also pictured in the Vienna Codex (p. 9) where the ocelot, attached by the tail, is connected by a cord with star-emblems.

There are two facts of special interest in regard to the above descent of Tezcatlipoca by a spider's thread. The first is that the title Tzontemoc="he who descends head foremost" is recorded in the Codex Fuenleal immediately after the name Mictlantecuhtli. The second is that the spider is figured on the manta of Mictlantecuhtli in the B. N. MS. and is sculptured in the centre, above his forehead, in his sculptured image, identified as such by Señor Sanchez (Anales del Museo Nacional III, p. 299) and reproduced here (fig. 19). It represents "the lord of the North or Underworld" descending, head foremost, with a tecpatl or flint knife issuing from his mouth and with outspread limbs, the outlines of which are almost lost under the multitude of symbols which are grouped around him. These symbols are carefully analyzed in my commentary on the B. N. MS. in which I also describe other known carved representations of the same conception and point out analogous pictures in the Maya Codices. The position of the limbs of the descending figure is best understood by a glance at fig. 20, II, from the Dresden Codex. It represents a bar with cross symbols from which a human body is descending. The feet rest on dual symbols, about which more could be written than the scope of the present paper allows. A tecpatl or flint knife, attached to the body by a double bow with ends, may be seen between the dual symbols, and its presence is of utmost importance since it proves that the Mayas also associated the flint with the same figure. Instead of a head the body exhibits a sort of equidistant cross with four circles. Strange to say, the only analogous cross-figures I have been able to find in all the Codices are those reproduced in fig. 20, I, III, and IV. The latter exhibits a curious, conventionalized flower growing on the top of a pyramid. Its stem and leaves are painted brown and are spotted, resembling the skin of an ocelot. As there is a Mexican flower, the Tigridia, of which the native name was ocelo-xochitl, it may be that it is this which is thus represented. Fig. 20, III, from the B. N. MS., figures as a sacred cake, alongside of the S-shaped xonecuilli breads which were made in honor of Ursa Minor at a certain feast. Finally, fig. 20, I, represents a certain kind of ceremonial staff which is inserted between the two peaks of a mountain—a favorite method employed by the native scribes, to convey the idea that the object figured was in the exact centre. This kind of staff occurs frequently in certain Codices, sometimes being carried by a high priest. It invariably exhibits a flower-like figure with five circles and is surmounted by a tecpatl or flint knife. Without pausing to discuss the subject fully I merely point out here that, collectively, these symbols explain each other and convey the idea of the Centre and the Four Quarters evidently associated with the tecpatl, the symbol of the north, and the ocelot and xonecuilli=Ursa Minor. It is particularly interesting to note that the outspread human body is made to serve as a sort of cross-symbol. A careful study of the conventional representation of the face of "the lord of the North," in fig. 19, gives the impression that it was also used to convey the idea of duality, or the union of two in one. The upper half of the face exhibits a numeral on either cheek under the eyes, seeming to convey the idea of dualities. The two circular ear ornaments, united by a band above the head, and the two nostrils united in one nose, seem to convey the idea of the union of the dualities, whilst the lower half of the face, which is rendered strikingly different to the upper, by being in higher relief and marked with perpendicular lines, exhibits a mouth from which a flint knife, with symbolical eye and fangs carved on it, is hanging like a tongue. I have already shown that the flint knife was regarded as the sacred producer of the "vital spark." I may add here that I have also found, in the Codices, tecpatl-symbols on which the curved symbol of air or breath was figured. To my idea the sculptured face is meant to symbolize the dual creator, the dispenser of the spark and breath of life, whilst the human skull on his back betokens that he is also the giver of death. Though unable to enter fully into the subject here, I would nevertheless state that I can produce further data to prove that the human face was frequently employed for a symbolical purpose by the native American races who were evidently entirely under the dominion of the idea of duality, of the Above and Below and the life-producing union of both.

Figure 20.

The question why the spider, named “tocatl” in Nahuatl, should have been adopted as the chief symbol of Mictlantecuhtli, occupied me much until I found the clue to its significance in the Maya language. In this the word for North is _Aman_ and the name for “the spider whose bite is mortal,” is _Am_. This striking fact may be interpreted as a positive proof that the spider-symbol, employed by the Mexicans, must have originated in Yucatan, from the mere homonymy of two Maya words.

On the other hand shell-gorgets exhibiting the effigy of a spider, and obviously intended to be worn with its head turned downwards, have not only been found in Illinois but also in Tennessee and Missouri. On the gorgets from the latter States a cross is carved on the body of the spider (fig. 22, _a_). As certain spiders exhibit cross-markings, it is, of course, possible that it was chosen as a cross-symbol for this reason only, in some localities, just as the butterfly was evidently adopted in Mexico, as an apt image of the Centre and the Four Quarters on account of its shape and its possession of four wings. The conventionalized figure of a butterfly, with a star on its body and four balls, painted with the colors of the quarters, was a sacred symbol which is minutely described by Sahagun and is figured on a manta in the B. N. MS. A glance at its reproduction (fig. 21, no. 13) shows how the form of the insect has been conventionalized so as to resemble the ollin (no. 12) and other Mexican cross-symbols (nos. 2, 4, 11, 14 etc.). The eye or star in its centre, like that in the ollin, and circle (no. 4), signify Polaris; the conventionalized head and antennæ are obviously made to convey the idea of “two in one,” of the Above and Below united in the Centre.

[Illustration.]

Figure 21.

I venture to suggest that the dragon-fly was employed as a cross-symbol in an analogous manner, on the Algonquin garment preserved at the Riksmuseum, Stockholm, and described by Dr. Hjalmar Stolpe in his admirable study on American art (Amerikansk Ornamentik, Stockholm, 1896, p. 30). As I shall revert to it later on, I now draw special attention to the circumstance that instead of the cross, on a spider-gorget from Tennessee, there is a round hole which, when the shell-disc is held aloft, lets a ray of light shine through and furnishes an apt presentation of a star. This and the cross furnish analogies to the Mexican and Maya symbols of Polaris which are too obvious to need to be emphasized. Nor do these gorgets alone furnish an undeniable indication that an identical symbolism extended from Yucatan to Illinois. Other gorgets, also figured in Mr. Wm. H. Holmes’ monograph “Art in Shell,” several of which are in the Peabody Museum, from the stone graves in Tennessee, exhibit variously carved representations of a serpent. In all specimens the identical idea is carried out: the eye of the serpent forms the centre of the design on the disc and four circles on the body of the reptile, or four solid bars, interrupting a hollow line encircling the central motif, emphasized a division of the disc into four equal parts. The idea of the Serpent in repose, the Centre and the Four Quarters is thoroughly carried out and the true meaning of the design is only appreciated by the light of the Maya and Mexican symbolism which has already been so fully discussed.

[Illustration.]

Figure 22.

The third Tennessee gorget reproduced here (fig. 22, _c_), from Mr. Holmes’ work, exhibits a combination of numerals which is particularly interesting if confronted with the sacred numbers of the Mexicans and Mayas. From a central circle three curved lines issue in a fashion resembling those on fig. 21, no. 2, but the fact that the circular band exhibits seven double circles and the outer edge is divided into thirteen parts, is of special moment. Still another design, on a shell-gorget from Tennessee, not only exhibits the peculiarity, pointed out by Mr. Holmes, of a square with loops, resembling certain figures in Mexican Codices, but also other significant details which I shall point out (fig. 22, _b_). The cross in the centre occupies the centre of a star with eight rays and the four birds’ heads at the sides of the square illustrate rotation from right to left. I am inclined to view in this gorget an emblem of Polaris with Cassiopeia in rotation around it, figured as a bird, but whether this is the case or not it must be conceded that it is indeed remarkable to find a set of symbols, consisting of the spider, the cross, the serpent and the bird, carved on prehistoric gorgets found in the United States whilst the deep meaning of these identical symbols is furnished by Maya and Mexican records. I venture to remark here that no more expressive and appropriate ornament than these shell-gorgets could have been designed, or worn by the ancient Maya or Mexican priests, prophets and leaders who, in a remote past, had guided themselves by the light of Polaris and instituted its cult as the basis of their native religion.

On realizing the above-mentioned identity of symbolism, it is impossible not to conclude that the prehistoric race which inhabited certain parts of the United States was under the dominion of the same ideas as were the Mexicans and Mayas. The indications

point, in fact, to the probability that the origin of the employment of the spider-symbol originated in Yucatan, and if this be admitted then there is no reason to deny the possibility that the serpent-symbol came from there also, since the Maya language suggests an affinity between the serpent, _can_, and the sky=_caan_, and the numeral 4=_can_. I refrain, for the present, from expressing any final conclusion on this subject, which will doubtless afford ample food for reflection and argument to all interested in the important problem as to where the cradle of ancient American civilization was situated. But these symbolic gorgets go far towards substantiating Professor Putnam's oft-expressed conclusions that the ancient peoples of the central and southern portions of the United States were, to a certain extent, offshoots of the ancient Mexicans.

[Illustration.]

Figure 23.

Before abandoning the subject of native symbolism and star-emblems I should like to present, as a curiosity, with an appeal to specialists to enlighten me as to the astronomical knowledge of the Eskimos, an Eskimo drawing from Professor Wilson's instructive and useful monograph. It is said to represent a "flock of birds," but so closely resembles Cassiopeia and Polaris that I am tempted to view it as an indication that the Eskimos may also have associated the idea of a celestial bird, or birds, wheeling around a central point, with the constellation and the pole-star (fig. 23). Having once ventured so far afield, I cannot refrain from presenting here an interesting set of aboriginal star-symbols, reproduced from Professor Wilson's comprehensive work (fig. 24), each composed of a cross combined, with a single exception, with a circle. I draw attention to the striking resemblance of some of these signs to those painted on the finely decorated pottery found on the hacienda of Don José Luna, in Nicaragua, and described by J. F. Brandsford, M.D. (Archaeological Researches in Nicaragua, Smithsonian Inst., 1881, p. 30, B), and suggest that, in both localities, the symbol may be a rudimentary swastika, and represent Polaris and circumpolar rotation.

St. Louis Academy. All others Peabody Museum. Willoughby, "Pottery from the Mississippi Valley." Journal of American Folk-lore, January-March, 1897.

In conclusion I refer the reader to Mr. C. C. Willoughby's valuable and most interesting "Analysis of the decorations upon pottery from the Mississippi Valley" (Journal Amer. Folk-lore, vol. X, 1897), in which he figures the remarkable specimens preserved in the Peabody Museum, Cambridge, the designs on which, as he states, "are mostly of symbolic origin and have been in use among various tribes within the historic period from the Great Lakes to Mexico." With the kind permission of the editor of the Journal, I reproduce some of Mr. Willoughby's illustrations on Plate III.

Figure 24. Crosses And Circles Representing Star Symbols, Arizona.

Returning to consider the probable result of the gradual diffusion of star-cult owing to natural causes and of the consequent divergence from the idea of the Centre, which had so deeply influenced the minds of primitive men during many centuries, with earnest, and extended astronomical observation, keeping pace with the development of the idea of the Above and Below, it is obvious that the utmost attention would be next given to the conspicuous star groups and planets which are visible at certain times and then seem to have departed or descended into the under world. Any one who has read the interesting communications by Herr Richard Andree (Globus. bd. LXIV, nr. 22), On the relation of the Pleiades to the beginning of the year amongst primitive people, followed by a note by Herr Karl von den Steinen on the same subject, will realize that widely-separated tribes of men, by dint of simple observation, knew the exact length of the periodical appearance and disappearance of this star group and regulated their year accordingly. Herr Andree cites, for instance, that "in the Society islands, the year was divided into two portions, the first of which was named Matari-i-inia=the Pleiades above. It began and lasted during the time when these constellations were visible close to the horizon after sunset. The second period, named Matarii-i-raro=the Pleiades below, began and lasted for the time during which the star-group was invisible after sunset" (W. Ellis, Polynesian Researches, vol. II, p. 419, London 1829). That the ancient Mexicans had likewise observed the Pleiades and been deeply impressed by them is proven by the well-known fact that the ceremony of the kindling of the sacred fire, which betokened the commencement of a new cycle, was performed "when the Pleiades attained the zenith at midnight precisely." In my complete monograph in the ancient Mexican calendar-system it will be my endeavor to present all the data I have collected concerning the degree of elementary astronomical knowledge attained by the

native astronomers. I shall, therefore, content myself with pointing out here that besides the foregoing testimony about the Pleiades, the native name for which was the miec=the many, or the tianquiztli=the marketplace, there are records proving that the cult of the planet Venus was a firmly established feature of the native religion at the time of the Conquest. Sahagun records that the Nahuatl names for this planet were citlalpul or hueycitlallin both signifying “the great star.” “In the great temple of Mexico an edifice named ilhuicatitlan [literally, the land of the sky] consisted of a great, high column, on which the morning star was painted.... Captives were sacrificed in front of this column annually, at the period when the star re-appeared” (_op. cit._ appendix to book II).

With regard to the connection of the Pleiades with the beginning of the Mexican cycle, it is interesting to note Herr Andree’s statements that the most intimate connection of the star-group with the thoughts of primitive people, would naturally take place in such localities where its periodical movements coincided with the changes of season, wind and weather which affected agriculture. A survey of the data presented by Herr Andree shows that the cult of the Pleiades attained its greatest development amongst tribes inhabiting a southerly latitude. It was in South America, indeed, that the Peruvians, alongside of their highly developed sun-cult, rendered homage and offered sacrifices to the Pleiades. In Mexico, the cult of the Pleiades appears as intimately associated with that of the sun and to have assumed importance only in historical and comparatively recent times, probably when the periodicity of the sun’s movements had been taught or recognized and the sign _ollin_, which is an exact presentation of the annual course of the sun, had been invented and adopted as a symbol. I have already pointed out that this sign occurs on the calendar-stone, for instance, which has a human face in its centre, bearing two numerals on the forehead and obviously symbolizing the union of two in one. In other instances the centre displays the eye, or star symbol and conveys the suggestion that the “four movements” of the circumpolar constellations were thereby symbolized. It may be that, in ancient Mexico, the two symbols, respectively referring to the movements of the sun and of the circumpolar star-groups, were emblematic of the two different cults or religions which existed alongside of each other. The first, the cult of the Above, of the Blue Sky, was directed towards the sun and the planets and stars intimately associated with sunrise and sunset, amongst them the Pleiades. The cult of the Below, of the Nocturnal Heaven, was directed towards the moon, Polaris and the circumpolar constellations—also to the stars and planets during the period of their disappearance and possibly in the same way to the enigmatical “Black Sun,” figured in the B. N. MS. which may have been the sun during its nightly stay in the House of the Underworld, whose door was in the west. In order to obtain an idea of the immense proportions ultimately assumed by these two diverging cults and the enormous influence they exerted upon the entire native civilization, it will be necessary to examine the form of the social organization in Montezuma’s time.

In order to comprehend this, however, it is first necessary to study carefully the myths relating to its origin. Torquemada (lib. VI, chap. 41) cites the authority of Friar Andreas de Olmos for the following native account of the creation of man, which was differently recounted to him in each province. He states that the majority of the natives, however, agreed that “there was in heaven a god named ‘Shining Star’ (Citlal-Tonac) and a goddess named ‘She of the starry skirt’ (Citlal-Cue), who gave birth to a flint knife (Tecpatl). Their other children, startled at this, cast the flint down from the sky. It fell to earth at the place named ‘Seven caves’ and ‘produced 1,600 gods and goddesses,’ ” a figure of speech which evidently expressed the idea that, in coming in forcible contact with the soil the flint gave forth sparks innumerable which conveyed vitality to numberless beings. It is evidently the same idea of “life sparks” being called into existence by the union of heaven and earth which underlies the Texcocan version of the creation of man recorded as follows by Torquemada (_op. et loc. cit._). “The sun ... shot an arrow towards the land of Acolma near the boundary of Texcoco. This made a hole in the ground whence issued the first man....”

[Illustration.]

Figure 25.

The illustrated version of the above myths, given in the Vatican Codex I, designates the celestial progenitor of human life as Quetzalcoatl, also named Tonaca-Tecuhtli=the lord of our subsistence, Chicome-xochitl=“Seven roses or flowers” and Citlalla-Tonalla=“The Milky Way,” literally, The shining stars. The dual divinity is figured (fig. 25, no. 4) as two persons with the shaft of an arrow over each of their heads and with the symbol Tecpatl=flint, between them as the issue of their union. In the Borgian Codex (fig. 25, no. 1), a barbed arrowpoint, instead of the Tecpatl, figures between the celestial parents. Their union is symbolized by a covering, the shape of which, in further representations (fig. 25, nos. 3 and 5) in the same MS., offers resemblance to the tau-shaped windows which are such a common feature in Maya and also in Pueblo architecture (fig. 25, no. 2_b_). The preceding data, which could be amplified, seem to show that the natives associated the tau-shape not merely with the idea of the Male and Female principles, but also with the Above and the Below, or Heaven (air and water) and Earth (earth and fire). I shall have occasion, further on, to refer again to the symbolism of the native tau.

The above illustrations, however, definitely prove that the flint knife and the arrow (with a flint point, presumably), were indiscriminately designated as the medium by means of which the spark of life was created and imparted to earth-born beings.

It will be proved further that, at the period of the Conquest, the arrow was revered as an image of life-producing force in Yucatan and Mexico. The flint knife cased in wrappings was called “the son” of Cihuacoatl, the earth-mother, and was regarded as her special symbol. It is significant, therefore, to find that it was the emblem of office of one of the two high priests, who alone employed it, as a sacrificial knife, in performing his awful duty of immolating human victims.

The fact that the cane-shaft of an arrow figures above the head of the celestial couple in the Vatican Codex is particularly interesting because the name Ome-Acatl=Two-Cane, is given as the name of a divinity by Sahagun (book I, chap. 15) and that the ceremony of kindling the New Fire, at the commencement of a cycle of years was also associated with the calendar sign Ome-Acatl (Sahagun, book VII, chap. 10).

At a certain festival images of Omacatl were manufactured and carried by the devout to their houses in order to receive from them “blessings and multiplication of possessions” (Sahagun, book II, chap. 19).

I draw attention to the fact that life is supposed to have proceeded from the union of stellar divinities, that the Tecpatl and flint are the well-known symbols for the North and Fire and that the Vatican commentator identifies the celestial parent as “Seven-Flowers.” What is more, Duran (vol. I, pp. 8 and 9) relates that the native race was organized into seven separate tribes and that these “claimed to have come out of ‘seven caves’ (Chicom-oztoc) which were situated in Teo-Culhuacan or Aztlan ‘a land of which all men know that it is in the North.’ ” Now Teo-Culhuacan is composed of the word Teotl, which designated the stars, the sun, the gods and, by extension, something divine or celestial. Culhua (_cf._ Coloa) means something bent over or recurved, or the action of describing a circle by moving around something, and _can_ means “the place of” in Nahuatl. This locality is represented in the picture-writings by a strange and impossible mountain with a recurved summit (fig. 26, no. 1). Aztlan literally means “the land of whiteness, brightness, light.” In Duran’s Atlas the seven caves are represented as containing men and women—the progenitors of the seven tribes. The order in which these are described, in the Mexican myth, as having issued from the caves, is instructive and sheds light upon the provenance and purpose of the tradition. It represents the Mexicans as the superior predestined race who remained in their cave the “longest, by divine command,” their “god having promised them this land.” The tradition relates that six tribes reached and settled down in the central plateau of Mexico, 302 years before the Aztecs arrived, under the leadership of Huitzilopochtli an oracular divinity, whose commandments were transmitted to the people by four priests (Duran, chap. II).

In my opinion it is impossible to study the above and supplementary data without realizing that the native race assigned its origin to a dual star-divinity, associated with the Tecpatl, the symbol for the North and for Fire. The peculiarity that the divinity is designated as Seven-flowers, and that there were seven tribes, indicates that the native idea was that each tribe came from one of the seven stars in Ursa Major or Minor. The Aztecs seem to have claimed for themselves the descent from the superior star, the central one, and to have thus justified or supported their ultimate establishment of a central government which ruled over the other six tribes.

[Illustration.]

Figure 26.

The assumption that the native race claimed descent from the Ursa Major or Minor constellation is further supported by the fact that the shape of the mythical recurved mountain and the name Aztlan=land of light or brightness are simultaneously explained, as well as the number of caves and tribes. It does not seem to be a mere coincidence that in two totally different Codices (the Selden MS. p. 7, Kingsborough, vol. 1, and the B. N. MS., p. 70) a sacred dance is represented as executed by seven individuals who move around a central seated personage. In the latter MS. the seated figure wears a head-dress surmounted by flint knives and his face is painted _red_ the color assigned to the North. Moreover the dance is taking place before an image of Mictlan-Tecuhtli, the lord of the North, whose raiment is strewn with cross-symbols. Referring to other native dances we find that the most sacred of all dances was performed at the festival of the god of fire by priests only, who, smeared with black paint to typify darkness and night, carried two torches in each hand and first sat, then slowly moved, in a circle, around the “divine brazier,” and finally cast their torches into it (Duran II, p. 174). This, probably the most ancient of sacred dances, must have been extremely impressive and significative to those who witnessed it, at night-time, from the base of the pyramid and heard the distant solemn chant of the dancers. To watchers from afar, the fire and the lighted torches revolving around must have seemed like a great central star with other stars wheeling about it.

Further on, it will be shown that the earliest form under which the Deity was revered was that of fire and the foregoing description fully explains why it was first chosen as the most fitting image of the central immovable star. It has already been shown that, in the popular game of “the flyers,” a high pole surmounted by one man served as the pivot for the circumvolation of the four performers, who “acted” the “flight of time.” The idea of an extended rule, proceeding from a central dual force, was, however, carried out on a grand scale in the most solemn of all public dances named the Mitotiliztli. Duran (II, p. 85) states that as many as “8,600 persons danced in a wheel in the courtyard of the Great Temple, which had four doorways, facing the cardinal points and opening out on to the four principal high roads leading to the capital. The doorways were respectively named after the four principal gods and were spoken of as ‘the doorway of such and such a god.’ ”

Clavigero, to whose work (Historia, ed. Mora, Mexico, 1844, p. 234) I refer the reader for further details, describes the dances at the time of the Conquest as having been most beautiful, and relates that the natives were exercised in these, from their childhood, by the priests. This authority also relates that the Mitotiliztli was performed by hundreds of dancers at certain solemn festivals, in the great central square of the city or in the courtyard of the temple, and gives the following description:

The centre of the space was occupied by two individuals (designated elsewhere as high priests) who beat measure on sacred drums of two kinds. One, the large huehuetl, emitted an extremely loud, deep tone, which could be heard for miles and was usually employed in the temples as a means of summoning to worship, etc. The second, the teponaztle, was a small portable wooden drum which was usually worn suspended from the neck by the leader in warfare and emitted the shrill piercing note he employed as a signal. The chieftains (each of which personified a god) surrounded the two musicians, forming several concentric circles, close to each other. At a certain distance from the outer one of these, the persons of an inferior class were placed in circles and these were separated by another interval of space, from the outermost circles, composed of young men and boys. The illustration given by Clavigero records the order and disposition of this sacred dance, which represented a kind of wheel, the centre of which was occupied by the instruments and their players. The spokes of the wheel were as many as there were chieftains in the innermost circle. All moved in a circle while dancing and strictly adhered to their respective positions. Those who were nearest the centre, the chieftains and elders, moved slowly, with gravity, having a smaller circle to perform. The dancers forming the outer circles were, however, forced to move with extreme rapidity, so as to preserve the straight line radiating from the centre and headed by the chieftains. The measure of the dance and of the chorus chanted by the participants was beaten by the drums and the musicians asserted their absolute control of the great moving wheel of human beings, by alternately quickening or slackening the measure. The perfect harmony of the dance, which successive sets of dancers kept going for eight or more hours, was only disturbed occasionally by certain individuals who pushed their way through the lines of dancers and amused these by indulging in all sorts of buffoonery. No one, on reading the above description of the most ancient and sacred of native dances can fail to recognize that it was an actual representation of axial rotation and that no more effective method of rendering the apparent differences in the degrees of velocity in the movements of the circumpolar and equatorial stars, could possibly have been devised. The fact that this dance was a most solemn and sacred rite, whose performance was obligatory to the entire population, indicates that it constituted an act of general obedience and homage and a public acknowledgment of the absolute dominion of a central dual, ruling power.

It is particularly interesting that, in this dance, the latter is represented by two individuals who respectively employ the sacred drum of the priesthood, and that used by war chieftains only (the one instrument emitting a low and the other a high tone); for the culture hero of the Tzendals, Votan, who, with the aid of his followers, taught this tribe the civil laws of government and the religious ceremonials, was entitled “the Master of the sacred Drum.” (See Brinton, American Hero-Myths, p. 214.)

Reverting to the organization of the native race into seven tribes and the wandering of the seventh and principal division, under the leadership of Huitzilopochtli: according to Tezozomoc (Cronica, p. 23), Huitzilopochtli was accompanied by “a woman who was called his sister and was carried by four men. She was a powerful sorceress, possessed the power of assuming the shape of an eagle, had made herself greatly feared and caused herself to be adored as a goddess.” Indignant at her arrogance the priests counselled a course which was adopted by the Mexicans. The woman and her family were left behind at Malinalco where they settled and populated a town, whilst the other portion of the tribe, under strictly masculine rule, advanced towards Tula where they established themselves. “This was the second division which had taken place, amongst the Mexicans or Aztecs ... and when they reached Tula they found their number greatly diminished.” This same incident is related with greater detail by Torquemada (vol. I, chap. II) from which we learn what a great animosity was felt against the woman. On one occasion, which I shall not pause to describe, two war chiefs menaced her. The “talk” she gave them in return is so remarkable that it deserves to be quoted in full; for it affords a deep insight into the native mode of expression, teaches us the titles of the woman and shows that her position was undoubtedly one of powerful authority.

“I am Quilaztli, your sister and of your tribe ... you know this and yet you think that the dispute or difference you have with me is like an ordinary one, such as you might wage with any ordinary base woman, who possessed little spirit or courage. If you indulge in this thought you are deceiving yourselves, for I am valiant and manly and my titles will oblige you to acknowledge this. For besides the ordinary name of Quilaztli, by which you know me, I also possess four titles, by which I know myself: the first of these is Cihuacoatl=the Woman-serpent (or twin); the second is Quauh-Cihuatl=the Eagle-woman; the third is Yao-Cihuatl=the Woman-warrior and the fourth is Tzitzimi-Cihuatl, the Woman of the Underworld. From the properties or qualities conveyed by these titles you can appreciate who I am; what power I yield and what harm I can do you and if you want to test the truth of this, here is my challenge!”

“The two brave captains, undaunted by the arrogant words by which she attempted to terrify them, responded: ’If you are as valiant as you describe yourself to be, we are not less so; but you are a woman and it is not meet that it should be said of us that we took up arms against women;’ and without speaking further they left her, much affronted that a woman should challenge and defy them. And they kept silence about this occurrence so that their people should not know of it.” Señor Alfredo Chavero (appendix, p. 125, to Duran’s Historia, Mexico, 1880), commenting upon this passage, says: “It is impossible to doubt that this tradition refers to an important event in the history of the Aztec tribe.... I think it contains the record of a religious struggle.”

The full significance of the narrative will become clear, I think, when the following points are dwelt upon. One thing is certain: here is a historical personage, a woman, who was termed _the sister_ of Huitzilopochtli, who evidently exerted a high authority and whose titles were actually the names of the highest female divinity. Sahagun (book VI, chap. 37) states that Quilaztli, a goddess, the same as Cihuacoatl, was the mother of all and was also named Tonant-zin=“our mother.” What is more significant still is that, in all historical records antedating the Conquest, a man bearing the feminine title of Cihuacoatl=serpent woman, is distinctly and repeatedly mentioned as the coadjutor of the Mexican ruler. Mr. Ad. Bandelier, in his careful study “On the social organization and mode of government of the Ancient Mexicans” (Twelfth Annual Report of the Peabody Museum of Am. Arch, and Ethn., Cambridge, 1879) to which I refer the reader, discusses the relative positions of Montezuma and the Cihuacoatl and states: “there is no doubt about their _equality_ of rank though their duties were somewhat different” (p. 665). This equality is illustrated by the records that both rulers shared the same privileges regarding dress. Thus they alone wore sandals and the Cihuacoatl is termed “the second or double of the king, his coadjutor” (Duran, chap. XXXII, p. 255 and Tezozomoc, chap. XL, p. 66). The latter author, however, gives the full “sacred title” as Tlil-Potonqui Cihuacoatl, literally, “the black-powdered woman-serpent” and we thus learn that, whilst Montezuma’s garments were habitually blue like Huitzilopochtli, his coadjutor, like Tezcatlipoca, was associated with black. It is well known that some of the Mexican priests always smeared their bodies with black, which was therefore their special mark.

To my idea the foregoing data, with circumstantial evidence too diffuse to be conveniently produced, clearly indicate that at one time, in the early history of the Aztec race, it had been governed jointly by a male and a female ruler on a footing of perfect equality, the one being the living representative of the Above or masculine elements and the other personifying the Below or feminine elements. The fact that Cihuacoatl is named “the sister” of Huitzilopochtli shows that the female ruler was not necessarily his wife, although she was his coadjutor in her own right. Both rulers were respectively served by four persons presumably of their respective sex. Besides these Duran (chap. 3) records that “there were also other seven teotls=lords, who were much reverenced on account of the seven caves out of which the seven tribes had come.”

We thus perceive that at one time the chief authority was vested in a man and a woman, his sister, who enjoyed a perfect equality. Four persons administered the government of each ruler and each of the seven tribes had “its honoured representative.” For how long this organization had existed it is impossible to tell. Dissension arose and division supervened, but to the time of the Conquest the identical form of government was in force with the remarkable difference that the title and office of the Cihuacoatl, originally held by a woman, were held by a man, whom I do not hesitate to identify as one of the two “supreme pontiffs,” whose emblem of office was the flint knife, the offspring of Cihuacoatl, the earth-mother.

Historical evidence shows that this alteration had not been made without bloodshed and renewed difficulties. Thus it is related that, long after the Mexicans had separated from the sister of Huitzilopochtli and her adherents, they were induced to “ask the daughter of the ruler of Culhuacan to become the Queen of the Mexicans and mother of their god. She conformed with their request but was subsequently killed by her subjects, who flayed her body and dressed a youth in her skin [a figure of native speech which symbolized his assumption of her office]. Under this form she was revered as a goddess, was named our grandmother and ‘the mother of the god,’ etc.” These and the following details, taken from well-known authentic native sources, are attractively rendered in the “Newe Welt und Amerikanische Historien” (Johann Ludwig Gottfriedt. Frankfurt-a.-M., 1613, pp. 54 and 55).

Again, after the Mexicans had been settled at Tenochtitlan for some time, they desired to make an alliance with the King of Culhuacan and therefore “chose to nominate, as their ruler, Acamapichtli, who was the son of a Mexican chieftain by a daughter of the Culhuacan ruler” and evidently lived with the latter. For it is related that, on giving his consent, the king of Culhuacan stated that if only a _woman_ (of his family) had been nominated he would have refused (to trust her to the Mexicans). The farewell words he addressed to Acamapichtli are worthy of quotation: “Go my son, serve thy god, be his representative. Rule the creatures of the god by whom we live; the god of day, of the night and of the winds. Go and be the lord of the water and land owned by the Mexicans.”

As it is subsequently stated that Acamapichtli _and his queen_ were received at Tenochtitlan with great honors, it would seem as though the Mexicans who, from some deeply-rooted religious idea, considered it essential to have a female ruler of the line of the king of Culhuacan, obtained their desire only by accepting a male member of her family as a protection and safeguard for her sacred person. It may be that for the reasons of safety and preservation the female ruler, who was the living representative of the Cihuacoatl, gradually retired into absolute seclusion whilst a man of her kin assumed, in public, her title and prerogatives.

Unless it is assumed that this was the case, it seems impossible to explain why Acamapichtli is designated in the Codex Mendoza (Kingsborough, vol. I, pl. II) as having begun to rule in the year I Tecpatl or flint (approximately corresponding to A.D. 1364) with the title of “Woman-serpent”=Cihuacoatl. From this date the title seems always to have been borne by a man. When human sacrifices had become a prominent feature of the native cult and it became a duty of the Cihuacoatl to perform the bloody rite, it is obvious that it became impossible for a woman to fill the position.

We obtain, however, glimpses of the shadowy form of an invisible and venerable female ruler who is at the head of the “House of Women,” watches over the welfare of the women of the tribe and officiates as a priestess, with her assistants, at births, baptisms and marriages. In order to account for the obscurity which surrounds her, it should be noticed that the mere fact that the ideas of darkness and seclusion became indelibly associated with the female sex, would naturally and inevitably cause women to be housed up, veiled and condemned to comparative inaction and immobility. A primitive stage in the growth of the above idea is shown in the case of the Huaxtecas, the women of which tribe wore abundant covering whilst the men, on religious principle, wore none. A careful study of the conditions surrounding the Cihuacoatl or high priest shows that he also conformed to the exigencies of his position when he acted as the representative of the hidden forces of Nature, of the female principle. He and the entire priesthood smeared their bodies with black, cultivated long hair, and wore, during the performance of certain religious ceremonies, a wide and long garment reaching to the ground. It is noticeable that the designs on the garments of the priests, in the B. N. MS., are invariably executed in red and yellow, the symbolical colors of the north and west, combined with black the symbol of the union of both, the Below. In this connection it is noteworthy that in Mexican pictography the faces of women are usually painted yellow—the color of the West=the female region. The association of darkness, concealment and secrecy, with the female principle, is exemplified by the fact that a building in the enclosure of the Great Temple of Mexico, named the “house of darkness,” was dedicated to the earth-mother=Cihuacoatl (Sahagun, appendix to book II). Other temples of hers are described as being cave-like, underground, dark, with a single low entrance, the door of which was sometimes sculptured in the form of the great open jaws of a serpent. Only priests were allowed to penetrate into these mysterious chambers where sacred and secret rites were performed and a sacred fire was also kept burning in an adjoining chamber. Evidence, which I shall produce further on, establishes that the high-priest Cihuacoatl dwelt, at times, in a house named “place of darkness” and annually sacrificed a human victim in honor of the lord of the underworld, in an edifice called “the navel of the earth.”

The religious cult of one-half of the Mexican hierarchy was distinctly nocturnal. The chief duties of certain priests were astronomical observation and the supervision of the sacred fire, which was kept perpetually burning on the summit of each temple-crowned pyramid, in what was termed “the sacred or divine brazier” of sculptured stone. Two priests jointly watched by night and day and received and transmitted to the flames the incense offerings of the devout. The temple fires were extinguished only at the expiration of a cycle of fifty-two years and were then rekindled by the high priest at midnight precisely, with impressive solemnity.

In ancient Mexico, it should however be observed, although the logical association of women with the hidden forces of nature, the underworld and the Below, had exerted a certain influence over her practical existence, it had not yet given rise to the idea of her inferiority as compared to man, the associate of the Heaven, the Above, the visible and active forces of nature. The native sages did not identify her so intimately with the earth as to deny her the possession of a soul—the celestial spark. On the other hand it is curious to note that the Nahuatl word for wife is Cihua-tlan-tli and for husband is Te-o-quichtli. Is it possible that the particle _tlan_ in the first and _Teo_ in the second may have contributed to strengthen the association of the woman with earth=tlalli (tlan=land of) and the man with Teotl, the sun, something divine and celestial? In course of time it doubtlessly would have transpired, in Mexico as elsewhere, that the set of primitive ideas which, during untold centuries, imposed upon women seclusion, obscurity and inactivity

and thus hindered her development of strength of body and mind, would have directly induced an inferiority. This has been subsequently proclaimed, as we know, in many countries, as a direct proof of her lower nature and of her affinity with the element earth. The assumed and actual inferiority of woman may therefore be regarded as the logical, inevitable but artificial result of primordial classification and association. Suggested by the same natural phenomena which were visible to all inhabitants of the same latitudes, these ideas occurred to all people at a certain stage of their development and exerted a dominating influence over the subsequent growth of their intelligence. It is but now, that, unconsciously, mankind is beginning to emerge from the leading strings of its infancy, which became an iron bondage to its prolonged childhood. In Mexico, at the period of the Conquest, the absolute equality of the male and female principles was theoretically maintained. At the same time it is possible to discern certain agencies at work which were tending to connect the Below, the female principle, with harm and evil. From time immemorial it had been the custom of the Chichimecs, who, according to Sahagun (book XII, chap. 12, par. 5), inhabited an extremely poor and barren region of Mexico, to sacrifice the first animal killed in a hunting expedition and to offer it to "the Sun whom they called father and to the earth their mother." They severed its head and raised this as though offering it to the sun. They _then tilled the earth where the blood had been spilt_ and left the animal which had been sacrificed, on the spot (Ixtlilxochitl, Historia Chichimeca chap. VI and Relaciones p. 335). This passage, establishing the cultivation of the soil where the blood had been spilt, sheds a flood of light on the origin of the offerings of human blood and the sacrifices of human life, which were such a prominent and hideous feature of the Aztec religion.

At the beginning of the sixteenth century, instead of the blood being spilt directly upon the earth, to insure and increase the fruitfulness of the soil, a human being was stretched across a conical stone which became thus the image of the earth-mother, his heart was extracted and offered to the sun, the Above, and his blood was then smeared on the mouth of certain idols representing the Below. In the B. N. MS. an interesting illustration and account are given of an idol of the earth-mother who is figured as standing on a pedestal adorned with skulls and cross-bones with outstretched tongue which signified, "that she always had great thirst for human blood" and "never refused sacrifices offered to her."

Two priests are likewise pictured in the act of offering bowls containing human blood to the idol and a third, mounted on a ladder, is pouring the contents of another bowl over its head. It is obvious how the constant associations of the earth-mother with sanguinary sacrifices and bloodthirstiness would, in time, give rise to the idea of a hostile, maleficent power, linked with darkness and devouring fire, who, under the aspect of the serpent-woman, waged an eternal warfare on the human race and clamored for victims and bloody sacrifices. The natural sequence to the above associations is that in ancient Mexico the powers exerting fatal influence upon the human race are all represented as female, viz.: the Cihuacoatl or woman-serpent, the Ciuapipiltin and the Tzit-zime, etc. These and various other personifications of the female principle are described in detail in my notes and commentary to the B. N. MS.

After considering the foregoing data it seems impossible not to conclude that it must have taken centuries of time for the idea of duality, or of the Above and Below to have taken such a deep hold upon the native mind and to have produced such a growth of symbolism and association in so many ramifications of thought. Let us endeavor to obtain a further insight into the native mode of thought by carefully studying some significant details concerning the social organization of the Mexicans from the time of Acamapichtli to that of Montezuma and the influences it had been subjected to gradually. This, the first ruler, unquestionably ruled as the Cihuacoatl, a name which means either Woman-serpent or Female-twin. This fact in itself testifies to an epoch-making change in the organization of the Mexican government, in the making of which a concession was made to a previously existing order of things, by the retention of the female title by a male ruler.

Having carefully studied the question for many years, I have long considered it proven that when the Mexicans settled in the valley of Mexico they came under a series of influences emanating from an ancient and highly cultured centre of civilization situated in the south, which had followed, during untold centuries, the same lines of primitive thought which have been stated. This question of contact and influence from an older civilization is so important and the material I have collected on the subject is so extensive and complex, that it cannot be adequately treated here. Further on I shall discuss at length certain historical data throwing light on ancient contact and influences. Meanwhile I may as well state here that, having carefully weighed all testimony, I accept as amply proven and well supported, the testimony of Las Casas, Torquemada, Mendieta and others, who record that the Mexican culture-hero Quetzalcoatl was an actual person who had come to Mexico from Yucatan twice and had finally returned thither, leaving a small colony of his vassals behind him whose influence upon the religious and social organization and symbolism of the tribes, inhabiting the central plateau, can be plainly discerned. Montezuma himself, in his famous speech to Cortés, which the latter carefully reported to the Emperor Charles V, states that: "we [the Mexican rulers] were brought here by a lord, whose vassals all of

our predecessors were, and who returned from here to his native land. He afterwards came here again, after a long time, during which many of his followers who had remained, had married native women of this land, raised large families and founded towns in which they dwelt. He wished to take them away from here with him, but they did not want to go, nor would they receive or adopt him as their ruler, and so he departed. Hut we have always thought that his descendants would surely come to subjugate this country and claim us as their vassals....” (Historia de Nueva España. Hernan Cortés, ed. Lorenzana, p. 81; see also p. 96). I do not see how it is possible to construe such plain, unadorned statements of simple, common-place facts into the assumption that Montezuma was recounting a mythical account of the disappearance of the Light-god from the sky, as upheld by some modern writers, who interpret the whole episode as a sun-myth or legend.

I have already shown that the meaning of the ocelot-skin and the spider, employed as symbols by the Mexicans, is apparent only when studied by means of the Maya language of Yucatan, the land whence the culture-hero is said to have come by the foregoing authorities. I will add here that in the Maya chronicles, it is stated that the culture-hero had ruled in Chichen-Itza, the first part of which name, _Chichen_, means _red_. In Mexican records it is described that he departed by water from the Mexican coast and travelled directly east, bound for Tlapallan—a name which means _red_-land. I draw attention to the fact that any one sailing from the mouth of the Panuco river, for instance, in a straight line towards the east, would inevitably land on the coast of Yucatan, not far from the modern Merida and the ancient ruins of Chichen-Itza.

I shall also produce evidence, further on, to show that the meaning of the much-discussed name of the culture-hero’s home, Tullan, is also furnished by the Maya language. From more than one source, we learn, moreover, that there were several Tullans on the American continent. The conception of _Twin-brothers_ as the personification of the Above and Below had been adopted in Yucatan and it is to the influence emanating from that source that I attribute the movement made in Mexico, to substitute male twin-rulers in the place of the man and woman, who had previously and jointly ruled the ancient Mexicans.

Let us now analyze the Maya title Kukulcan, of which Quetzalcoatl is the Mexican equivalent. As already stated, the word _can_ means serpent and the numeral 4 and is almost homonymous with the word for sky or heaven=_caan_. The image of a serpent, therefore, directly suggested and expressed the idea of something quadruple incorporated in one celestial being and appropriately symbolized the divine ruler of the four quarters. In the word Kukulcan the noun _can_ is qualified by the prefix _kukul_. In the compiled Maya dictionary published by Brasseur de Bourbourg (appendix to de Landa’s Relacion) the adjective _ku_ or _kul_ is given as “divine or holy.” Kukulcan may therefore be analyzed as “the divine serpent” or the “Divine Four.” When Maya sculptors or scribes began to represent this symbol of the divinity they must have searched for some object, easy to depict, the sound of whose name resembled that of ku or kul. The Maya adjective “feathered” being _kukum_, the artists evidently devised the plan of representing, as an effigy of the divinity, a serpent decorated with feathers and to this simple attempt at representing the “divine serpent” in sculpture or pictography is due, in my opinion, the origin of the “feathered serpent” effigies found in Yucatan and Mexico, which have so puzzled archaeologists.

Of Kukulcan, the culture-hero of the Mayas, it is recounted that he had been one of four brothers who originally ruled at Chichen-Itza, over four tribes. “These brothers chose no wives but lived chastely and ruled righteously, until, at a certain time, one died or departed and two began to act unjustly and were put to death. The one remaining was Kukulcan. He appeased the strife which his brothers’ acts had aroused, directed the minds of the people to the arts of peace and caused to be built various edifices. After he had completed his work at Chichen-Itza he founded the great city of Mayapan, destined to be the capital of the confederacy of the Mayas.” (See Brinton, Hero-myths, p. 162.) Friar Diego de Landa relates that the current opinion amongst the Indians of Yucatan was that this ruler had gone to Mexico where, after his return (departure?) he was named Cezalcouatl and revered as one of their gods (Relacion, ed. Brasseur de Bourbourg, p. 36). Before analyzing the Nahuatl rendering of Kukulcan’s name I would point out the noteworthy coincidence that, during his reign at Chichen-Itza and Mayapan, he practically united in his person and assumed the offices formerly fulfilled by four rulers, of which he had been only one.

I would, moreover, draw attention to the remarkable, sculptured columns which support the main portal of the main pyramid-temple called El Castillo at Chichen-Itza. These represent gigantic feathered serpents and are figured on pl. XIV of Mr. Wm. Holmes’ most instructive and useful “Archaeological Studies,” Part I, “Monuments of Yucatan.” The feathers carved on the massive columns are evidently the precious tail feathers of the quetzal, which have the peculiarity of exhibiting, according to the way the light falls upon them, blue, red, yellow and green colors—precisely those assigned to the four quarters by the Mexicans and for all we know to the contrary, by the Mayas. Whether this feather was chosen for this peculiarity or for its beauty only, as that with which to deck the effigy of the divinity, can, of course, only be conjectured. In Mexico numberless effigies of feathered serpents exist. The resemblance of the sound of the Nahuatl words: feather=ihuitl, and heaven or sky=ilhui-çatl, should be recorded here as a possible

reason for the association of feathers with the serpent and as a means of conveying the idea of its divinity. It should also be noted that quetzal, the name of the most precious feathers the natives possessed, resembles in sound, the second part of the Nahuatl words for flame=tle-cueçal-lotl, or for “tongue of fire”=tle-cueçal-nenepilli. That the feathered serpent was an image of the divinity is finally proven, I think, by the following passage from Sahagun which establishes that the earliest form, under which the divinity was revered by the Mexicans, was that of fire: “Of all the gods the [most] ancient one is the God of Fire, who dwells in the midst of flowers, in an abode surrounded by four walls and _is covered with shining feathers like wings_” (_op. cit._ book VI, chap. IV). It is thus shown that whilst the word ihuitl=feather suggested something divine, the word quetzal, besides being the name of a particular kind of feather, conveyed the idea of something resplendent or shining [like fire]. The name for serpent, coatl, signified twin; thus there is a profound analogy between the Maya and Mexican symbol, pointing, however, to the Yucatan form as the most ancient.

Let us see how the name Quetzal-coatl occurs in Mexico. It is given as the name of the “supreme god whose substance was as invisible and intangible as air,” but who was also revered as the god of fire. The constant reference to air in connection with the supreme divinity caused him to be also adored as the god of air and of the four winds. On the other hand, the divine title of Quetzal-coatl was carried by the culture-hero whose personality has been discussed and who was a Yucatec ruler and high priest. Sahagun (_op. cit._ book III, chap. IX) informs us that “Quequet-zalcoa,” the plural form of the word Quetzalcoatl, was employed to designate “_the high priests_ (elsewhere designated as the ‘supreme pontiffs’) _who were the successors of Quetzalcoatl_.” He also states that “the high priest of the temple was [the representative of] the god Quetzalcoatl” (book I, chap. 5). “The priest who was most perfect in his conduct and in wisdom was elected to be high priest and assumed the name of Quetzalcoatl.... There were two such high priests equal in rank and honours.... One of these, the Quetzalcoatl Totec Tlamacazqui, was in the service of Huitzilopochtli.” Without pausing here to analyze this title since it will be discussed in detail in another publication I will only repeat that, after years of careful research, I have obtained the certainty that the foregoing title and office were those held by Montezuma at the time of the Conquest. What is more, I can produce ample evidence to prove that he was the living personification of Huitzilopochtli one of the “divine twins” and of the Above. He was not the first Mexican ruler who had filled this exalted rôle, for it is recorded that Axayacatl, one of Acamapichtli’s successors, had represented, in life, “our god Huitzilopochtli.” After his death his effigy “was first covered with a fine robe representing Huitzilopochtli; over this was hung the dress of Tlaloc ... the next garment was that of Youalahua [=the lord of the wheel] and the fourth was that of Quetzalcoatl” (Duran, vol. I, chap. 39, pp. 304 and 306).

Let us now see how Montezuma’s personification of Huitzilopochtli was carried out by his life and his surroundings. According to Bernal Diaz, an eye-witness, when the great Montezuma came forth in state to meet Cortés, he was conveyed on a sumptuous litter, being thus raised above the earth.(6) When he descended from this and walked, the golden soles of his sandals prevented his feet from coming into direct contact with the ground; he was supported, _i. e._ partially held up, by his four principal lords, and a baldachin adorned with light greenish-blue feathers, gold, pearls and jade representing the xoxouhqui-ilhuicatl=“the verdant or blue sky” (which was, by the way, a title of Huitzilopochtli), was carried over his head. Other lords preceded him, “sweeping the ground and spreading blankets upon it so that he should not tread upon the earth. All of these lords did not dare to think of raising their eyes to look at his face—only the four lords, his cousins, who supported him, possessed this privilege” (Bernal Diaz, Historia Verdadera de la Conquista. Madrid, 1632, p. 65). A feature, the origin of which can be directly traced back to the association of the star-god, Polaris, with repose and immovability, was that Montezuma, like his predecessors, was the only person privileged to sit on state occasions, on a throne or raised seat with a high back and rest whilst all other individuals stood or moved about him.

From several sources we know that Montezuma habitually wore blue or white attire, which sometimes was of open network. He employed gold, precious blue and green feathers, turquoise, pearls and emeralds for his personal ornaments. His diadem with a high point in front, was incrusted with turquoise or was made of burnished gold. He sometimes wore a crown made of featherwork, with a bird’s head of gold above his forehead. His emblem was the sun, the orb of day, and he presided over its cult which had developed itself simultaneously with the cult of the Above, a feature of which was the offering of “birds, butterflies and flowers.” Sometimes he wore, “attached to his sandals, small wings, named tzi-coyolli, resembling the wing of a bird. These produced a sound like that of tiny gold bells when he walked” (Tezozomoc, Cronica, p. 594).

It must be admitted, on reading the foregoing descriptions gleaned from Sahagun’s Historia, that it would be impossible to carry out, more perfectly and completely, the idea that Montezuma was the earthly representative of the Upper regions, the blue heaven. By pushing symbolism so far that he actually wore wings on his feet and avoided contact with the ground, it is not surprising that Montezuma’s adversaries, amongst neighboring tribes, should accuse him of exacting divine honors for his own person. At the same time there is no doubt that his own subjects revered him merely as a temporary representative and mouth-piece of the impersonal dual divinity. This idea is clearly conveyed by some native harangues, to which I refer the reader, and from which I

extract the following passages:

After his election, the ruler is solemnly addressed by one of the chief lords who says to him: “Oh! our humane, pious and beloved lord, who deserves to be more highly esteemed than all precious stones and feathers, you are here present because our sovereign god has placed thee [above us] as our lord.... You possess the seat and throne which was given [to your predecessors] by our lord god” ... “you are the image of our lord god and represent his person. He reposes in you and he employs you like a flute through which he speaks and he hears with your ears.... Oh, lord king! God sees what the persons do who rule over his domains and when they err in their office he laughs at them, but in silence, for he is god, and is omnipotent and can mock at whom he will. For he holds all of us in the palm of his hand and rocks us about, and we are like balls or round globes in his hands and we go rolling from one side to the other and make him laugh, and he serves himself of us as we go moving about on the palm of his hand!”

“Although thou art our neighbour and friend and son and brother, we are no more thy equals, nor do we consider you as a man, for now you have the person, the image, the conversation and the communion of our lord god. He speaks inside of you and instructs you and lets himself be heard through your mouth—his tongue is your tongue, and your face is his face ... he has adorned you with his authority and has given you fangs and claws so that you should be feared and reverenced ...” (Sahagun, book VI, chap. 10).

The foregoing figure of speech in which fangs and claws are alluded to as symbols of fear-inspiring power affords as valuable an insight into the native modes of thought and expression as do the similes employed in the following address to the newly-elected ruler by the spokesman of his vassals.

“Oh lord! may you live many years to fill your office prosperously; submit your shoulders to the very heavy and troublesome load; extend your wings and breast as a shelter to your subjects whom you have to carry as a load. Oh, lord! let your town and vassals enter under your shadow, for you are [unto them] like the tree named puchotl or aueuetl, which casts a great circle or wheel of shade, under which many are gathered in shelter” (_op. cit._ book VI, chap. II).

The admonition also addressed to the ruler, “Never to laugh and joke again as he had done previously to his election, and to assume the heart of an old, grave and severe man,” explains the true significance of the name of Montezuma or Mo-tecuh-zoma; which was an honorific title literally meaning, “our angry or wrathy [looking] lord.”

Whilst the above data establish beyond a doubt that the Mexican Quetzalcoatl was regarded as the visible representative of the celestial ruler of the universe and that divine honors were voluntarily accorded to him, it is interesting to read Montezuma’s explanation to Cortés concerning this question. The latter writes: “seated on a raised seat Montezuma discoursed as follows: ... ‘I know that you have been told by my enemies that I am, or have made myself a god.’... Raising his robes he showed me his body saying: ‘Here you see that I am made of flesh and bone, like yourself or like any one, and that I am mortal and tangible.’ Grasping his arms and his body with his hands he continued: ‘see how they have like to you.’ ”... (Historia, Hernan Cortés, ed. Lorenzana, p. 82). Better than all dissertations, the above words convey an idea of the naïf simplicity of the man who uttered them.

Referring the reader to Mr. Ad. Bandelier’s study, “On the social organization and mode of government of the ancient Mexicans,” for further details concerning the duties respectively filled by Montezuma and his coadjutor, I shall only explain here the conclusion I have reached that the former was the high priest of the cult of the sun and heaven, the visible ruler, the war lord, and the administrator of justice. As stated in a native harangue: “the supreme lord is like unto the heart of the population ... he is aided by two senators in all concerning the administration of the government: one of these was a ‘pilli’ and was named tlaca-tecuhtli; the other was a warrior and was entitled tlacoch-tecuhtli. Two other chieftains aided the supreme lord in the militia: one, entitled tlaca-teccatl, was a ‘pilli’ and warrior; the other, named tlacoch-calcatl, was not a ‘pilli.’ Such is the government or administration of the republic ... and these four officers did not occupy these positions by inheritance but by election” (Sahagun, book VI, chap. 20).

The following account of the republic of Tlaxcalla throws further light upon the form of government which prevailed throughout Mexico and Central America at the period of the Conquest. “The Captains of Tlaxcalla, each of whom had his just portion or number of soldiers ... divided their soldiers into four Battails, the one to Tepeticpac, another to Oco-telulco, the third to Tizatlan and the fourth to Quiahuiztlan, that is to say, the men of the Mountains, the men of the Limepits, the men of the Pinetrees, and the Watermen; all these four sorts of men did make the body of the Commonwealth of Tlaxcallan, and commanded both in Peace and War ... The General of all the whole army was called Xico-tencatl, who was of the Limepits ... the Lieutenant General was Maxix-catzin....” (A new survey of the West-Indies ... Thomas Gage, London, 1655, p. 31). In Mexico we find that the four executive officers were the chiefs or representatives of the four quarters of the City of Mexico. In each of these quarters there was a place where periodical offerings were made in reverence of one of the signs: acatl, tecpatl, callii and tochtli, which were the symbols of

the cardinal-points, the elements, and served as day and year signs in the calendar (Sahagun, book II, chap. 26).

An interesting indication that the entire dominion of Mexico was also divided into four equal quarters, the rule administration of which was attended to by four lords, inhabiting towns situated within a comparatively short distance from the capital, is furnished by Bernal Diaz (_op. cit._ p. 65). He relates that the four lords who supported Montezuma when he walked in state to meet Cortés were the lords of Texcoco, Iztapalapa, Tacuba and Coyoacan. These towns, which were minor centres of government, were respectively situated at unequal distances to the northeast, southeast, northwest and southwest of the capital.

These facts and the knowledge that “all lords, in life, represented a god” justify the inference that, just as Montezuma represented the central power of the Above or Heaven, the four lords who accompanied him were the personified rulers of the four quarters, associated with the elements. In ancient Mexico and Maya records the gods of the four quarters, also named “the four principal and most ancient Gods” are designated as “the sustainers of the Heaven” and it cannot be denied that, on the solemn occasion described, the four lords actually fulfilled the symbolical office of supporting Montezuma, the personification of the Heaven. This striking illustration is but one of a number I could cite in proof of the deeply ingrained mental habit of the native sages to introduce, into every detail of their life, the symbolism of the Centre, the Above and Below and the Four Quarters. I shall but mention here that it can be proven how, in their respective cities the lords of the cardinal points were central rulers who, in turn, directed the administration of the government by means of four dignitaries. Each of these was also the embodiment of a divine attribute or principle, “All noblemen did represent idols and carried the name of one” (Acosta, Naturall and Morall Historie, lib. 5, p. 349).

Each wore a special kind of symbolical costume and was the ruler or “advocate,” as he is termed, of a distinct class of people. “For to each kind or class of persons they gave a Teotl [=God or Lord] as an advocate. When a person died and was about to be buried, they clothed him with the diverse Insignia of the god to whom he belonged” (Mendieta lib. II, chap. 40). It being established that each of the four year-symbols, acatl, tecpatl, calli and tochtli, ruled four minor symbols, it seems evident that, just as the four lords of the cardinal-points would correspond to the above symbols, each of the minor lords and the category of people they represented would also be associated with the minor symbols. The obvious result of this classification would be the division of the entire population of the commonwealth into 4×5=20 categories of people, grouped under twenty local and four central governments, whose representatives in turn were under the rule of the supreme central dual powers. Having thus sketched, in a brief and preliminary way, the expansion of the idea of dividing all things into four parts, the bud of which was the swastika, let us examine the Mexican application of the idea of duality, pausing first to review the data relating to the Cihuacoatl, the personification of the Earth, the Below and the coadjutor of Montezuma.

Nothing has been definitely recorded about his personality, for he seems to have lived in absolute seclusion during the first occupation of Mexico by the Spaniards. He is frequently alluded to, however, and Cortés, Herrera, Torquemada and others, inform us that he had acted as Montezuma’s substitute and led the native troops against the Spaniards. It is interesting to find that after the Conquest Cortés appointed him as governor of the City of Mexico. “I gave him the charge of re-peopling the capital and in order to invest him with greater authority, I reinstated him in the same position, that of Cihuacoatl, which he had held in the time of Montezuma” (Carta Cuarta, Veytia I, p. 110).

Quite indirectly, it is possible to learn what sort of military equipment had been adopted by the Cihuacoatl when he acted as war-chief. Amongst certain presents, which were sent by Cortés to Charles V and are minutely described in vol. XII of the “Documentas ineditas del Archivio de Indias,” p. 347, there are several suits of armor, which could only have been appropriately worn by the “woman serpent.” One suit consisted of a “corselet with plates of gold and with woman’s breasts” and a skirt with blue bands. Another suit, instead of the breasts, exhibited a great wound in the chest, like that of a person who had been sacrificed. In another list (by Diego de Soto, p. 349) a shield is described “which displayed a sacrificed man, in gold, with a gaping wound in his breast, from which blood was streaming....” It is obvious that the first of these suits of armor conveyed figuratively the name and the second the office of the Cihuacoatl of whom Duran speaks as follows:

“He whose office it was to perform the rite of killing [the victim] was revered as the supreme pontiff and his name or title and pontifical robes varied according to the different periods [of the year] and the ceremonies which he had to perform. On the present occasion his title was Topiltzin, one of the names of the great lord ... (Quetzalcoatl) and he appeared carrying a large flint knife in his hand ...” (_op. cit._, chap. LXXXI). The following passage shows definitely that Montezuma’s coadjutor, his Quetzalcoatl or divine twin, had an equal share of divine honors accorded to him. “The head priest of the temple, named Quetzalcoatl, never came out of the temple or entered into any house whatever, because he was very venerable and very grave and was esteemed as a god. He only went into the royal palace” (Sahagun, book VI, chap. 39). The same authority designates the second “divine twin” as the

Tlalocan-tlamacazqui or, Tlalocan-tlenamacac and states that he served the Tlalocan-tecuhtli.

Before proceeding further, let us pause and inquire into the reason why the name Tlaloc, which is formed of tlalli=earth and is defined by Duran, for instance, as meaning “an underground passage or a great cave” (_op. cit._, chap. 84), should be the well-known title of the “god of rain.” The explanation is to be found in the text of the Vatican Codex, A. Kingsborough, V, p. 190. This teaches us that the last syllable of the name Tlaloc does not represent oc=inside of, but stands for octli, the name of the native wine now known as pulque, which is obtained from the agave plant. Tlaloc thus meant “earth-wine” and “by this metaphor they wanted to express that just as the fumes of wine make mankind gay and happy, so the earth when saturated with water, is gay and fresh and produces its fruits and cereals.” By the light of this explanation we see that the titles conferred upon Montezuma’s coadjutor were literally “the priest or lord, or dealer-of-fire in the place of the earth-wine.” “The clouds, rain, thunder and lightning were attributed to the lord Tlaloc who had many tlalocs and priests under him, who cultivated all foods necessary for the body, such as maize, beans, etc., and sent the rains so that the earth should give birth to all of its products. During their festival in springtime the priests went through the streets dancing and singing and carrying a shoot of green maize in one hand and a pot with a handle in the other. In this way they went asking for the [ceremonial] boiled maize and all fanners gave them some” ... (Sahagun, book VI, chap. 5).

The above and many scattered allusions throw light upon the group of ideas associated with the Cihuacoatl and clearly indicate what were his duties. To him devolved the care of the earth and his one thought was to secure abundance of rain and of crops. In order to ensure the proper cultivation of the ground, he had, under him, innumerable agents, who strictly superintended the cultivation of all food-plants, the irrigation of barren lauds, etc. These agents, who also resorted to ceremonial usages in order to bring rain or avert hail-storms and other disasters, were collectively named “the 400 pulque or octli-gods”—an appellation which developed into tochtli-gods, when the rabbit (=tochtli) had become the pictograph habitually employed to convey the sound of the word octli, and had been adopted as the symbol of the earth and of prolific reproduction in connection with this. The latter idea is born out of the female title, that of the earth-mother, who “always brought forth twins.” The Cihuacoatl thus stands out as the representative of the bountiful mother-earth and as the lord of agriculture, one of whose duties was the careful collection, storage and distribution of all food products. He presided over the cult of the fertility of the earth, of the nocturnal heaven, of the stars and moon, which were associated with the female principle and with growth in general. The following record proves that amongst his other duties he offered sacrifices to the invisible hidden powers of darkness and earth. “During the night, in the feast Titítl, the high priest named Tlillan tlenamacac [=the dealer with fire in the land of darkness=tlilli=black, evidently a title analogous to that of Tlill-potonqui-cihuacoatl, given by Tezozomoc, in Cronica, chap. 33], sacrificed a victim in honour of the god of the Underworld” (Sahagun, book II, appendix). In this, as on similar occasions, he was assisted by four priests who succeeded him in rank.

Mr. Bandelier has already recognized that judicial sentences were ultimately referred to the “woman-serpent,” who pronounced the “final sentence, which admitted of no appeal.” There are more reasons than can conveniently be presented here, proving that in Mexico, as in Guatemala, the priest of the Below, the personification of Tezcatli-poca=Shining Mirror, employed an actual mirror made of polished obsidian, as an aid in pronouncing final judgment on criminals.

The Cakchiquel procedure is described by Fuentes of Guzman, who is quoted by Dr. Otto Stoll in his most instructive and valuable work on the Ethnology of the Indian Tribes of Guatemala (Internationales Archiv für Ethnographie, band I, supplement I, 1888): “A road leads [from the ancient city of Guatemala] to a hill [figured with a large tree growing from it]; on its top there is a flat circular cement floor, enclosed by a low wall. In the centre is a pedestal, polished and shining like glass. No one knows of what substance it is made. This was the tribunal or court of the Cakchiquel Indians, where public trials were held and where the sentences were executed. The judges sat in a circle on the low wall. After the sentence had been pronounced, it had to be confirmed or vetoed by another authority. Three messengers, acting as deputies of the council, went to a deep ravine situated to the north of the palace, where, in a sort of hermitage or prayer-house, there was the oracle of the devil, which was a black, transparent stone, like glass, but more costly than [ordinary] obsidian. In this stone the devil revealed to the messengers, the sentence to be executed. If it agreed with the judgment pronounced, this was immediately executed upon the central pedestal [of the hill of justice] on which the criminal was also tortured, at times.” If nothing was seen in the mirror, and it gave no sign, the prisoner was pronounced free.

This oracle was also consulted before wars were undertaken ... “During the first years of the Spanish occupation, when the bishop Marroquin heard about this stone, he had it cut out and consecrated it as an altar, which is still in use in the convent of San Francisco in the capital. It is a precious stone of great beauty and is half a vara long.”

A picture in the Vatican Codex B (p. 48) represents a temple, on the summit of which a large obsidian mirror is standing on its edge. Inside the doorway there are many small black spots, which obviously represent small mirrors and convey the idea that the interior walls were incrusted with such. These illustrations would prove that sacred edifices were associated with obsidian mirrors even if Sahagun did not mention, as he does (book II, appendix), no less than three sacred edifices in the great temple of Mexico, which were associated with obsidian mirrors. It is, moreover, stated by Duran that “in Mexico the image of the god Tezcatlipoca was a stone, which was very shining and black, like jet. It was of the same stone of which the natives make razors and knives,” _i. e._, obsidian (Duran II, p. 98).

What is more, Bernal Diaz relates that the image of Tezcatlipoca, which he saw beside the idol of Huitzilopochtli in the hall of the great temple of Mexico, had shining eyes which were made of the native mirrors=tezcatl. “In connection with the shining eyes” of the god it is interesting to note that when, as Duran states, he was represented under another form, his idol “carried in its hand a sort of fan made of precious feathers. These surmounted a circular gold disc which was very brilliant and polished like a mirror. This meant that, in this mirror, he saw all that went on in the world. In the native language they named it ‘itlachiayan,’ which means, that in which he looks or sees” (Duran, _op. cit._, vol. II, p. 99).

Sahagun mentions an analogous sceptre which consisted of “a gold disc pierced in the centre, and surmounted by two balls, the upper and smaller of which supported a pointed object. This sceptre was called tlachieloni, which means ‘that through which one looks or observes;’ because with it one covered or hid one’s face and looked through the hole in the middle of the gold plate.” This kind of sceptre is not exclusively associated with Tezcatlipoca in the native picture writings, for it figures in the hand of Chalchiuhtlycue “the sister” of Tlaloc and of Omacatl whose attributes, the reeds and chalchiuite or jade beads, prove him to be also associated with the water. On the other hand the same sceptre is also assigned by Sahagun to the god of fire.

A clue to the truth and significance of this emblematic sceptre is furnished by the fact that, in order to express the divine title Tlachiuale, meaning “the Maker or Lord of all creatures or of young life,” the native scribes were naturally obliged to employ the verb tlachia=to look or see, in order to convey its sound. It is obvious that they cleverly agreed to express this verb by picturing some object which could be or was looked through. They therefore adopted a sceptre with a hollow disc, as an emblem, which was carried by the living representative of certain divinities, whose entire costume was in reality a sort of rebus, and in the case of Tlaloc, the lord of earthwine and fertility and the Tlachiuale or “Creator of young life,” par excellence, they once and for all designated his title by surrounding his eyes with two blue rings, accentuating thereby the action of seeing or looking. But this probably conveyed even more than the above title, for there is a Nahuatl noun tlachiuhtli, which means, “something made or formed or engendered,” or “earth which is ploughed and sown.” Then there is the verb tlachipaua which means, “the smile of dawn, the break of day, the clearing up of the weather,” also the purification and cleansing, all of which were supposed to be under the dominion of the rain-god and of his living representatives on earth, the rain-priests. The seemingly conflicting fact that the tlachieloni sceptre was also assigned to the god of fire is explained by the existence of the verb tiachinoa=to burn up the fields or forests, and of the noun tlachi-noliztli=the act of burning up or scorching the fields or forests, and finally, metaphorically, tlachinoli-teuotl=war or battle=destruction. It is only when we thus realize all the natives could express by the image of an eye, looking through a circle, that we begin to grasp its full meaning when employed as a symbol in their picture writings.

As to the obsidian mirror, which undoubtedly was the symbol of Tezcatlipoca and, consequently, must have pertained to his representative, the priest of the Night, we find that it played a most prominent rôle in the cult he presided over. In the first case it appears as though it was resorted to in Mexico as in the conquered province of Guatemala, as the oracle which rendered final judgment. A series of illustrations, etc., to be published in my final work on the Calendar System, will prove satisfactorily that the Mexican astronomers extensively employed black obsidian mirrors as an aid to astronomical observations, by means of reflection. Besides mirrors on the summits of temples and mountains, certain square columns, placed on an elevation and faced with a broad band of polished obsidian, are pictured in some Codices. It is obvious that the latter in particular, if carefully oriented, would have served as an admirable means of registering the periodical return of planets, stars or constellations to certain positions; they would then be reflected on the polished surface, as in a frame. In certain Codices the double, tau-shaped courtyard or enclosure surrounded by a high wall with battlements, which was employed in the daytime for the national game of ball, figures in combination with obsidian mirrors. I draw attention to the fact that the name of these courtyards was tlach-tli, which literally means the looking place=the observatory and that, amongst the edifices of the great temple, a tezca-tlachtli=obsidian-mirror-observatory, is described. I shall demonstrate more fully, on another occasion, that the chief purpose of these enclosures was to serve as astronomical observatories. Dr. Brinton, Señor Troncoso and other authorities have already observed that the game of ball itself was intended to represent the idea of the perpetual motion of the heavenly bodies. (See American Hero-myths, p. 119.)

Returning to reëxamine the divine title Tezcatlipoca we see that, when interpreted as “the lord of the shining obsidian mirror,” it was the most appropriate title of the lord of the Nocturnal Heaven, which myriads of mirrors reflected each night, throughout the land. It is easy to see how the habit of referring to the Temple Minor, in order to ascertain the positions of the stars, would naturally lead to its being consulted more extensively as an oracle later on. We thus clearly perceive how the lord of the Night, whose priests called themselves “the sons of the Night,” became intimately associated with divination and how the idea of a definite connection between the movements of the stars or human destinies would, in the lapse of centuries, make a deep and indelible impression upon the minds of men.

If the obsidian mirror was the symbol, par excellence, of Mexican star cult, there are evidences that the small mirror of polished pyrites was that of the sun-cult. The latter seems to have been employed, in some way or other, for the concentration of the rays of the sun required for the lighting of the sacred fire, at noon, on the days of the vernal equinox and summer solstice. As in Peru, this duty devolved upon the high priest of the Above or the Son of the Sun, a title which undoubtedly pertained also to the Mexican ruler, though not employed so ostentatiously as in Peru. A keen emulation, which may almost be termed an intense rivalry, seems to have existed between the two cults, which Sahagun even goes so far as to designate as two religions. From a chapter of his Historia we even learn that the entire population of Mexico was divided into two halves who respectively belonged to one or the other religion, a fact which naturally affected the position of the two classes of people and had created the native ideas, of an upper and a lower class or caste which will be further discussed.

Sahagun’s informants explained to him that, when a child was born, its parents, according to their class, registered it at one of the two educational establishments for the young and took vows to have it educated there as soon as it attained a suitable age. The lower class took their offspring to the Telpuchcalli, where they were dedicated to the service of the community and to warfare, _i. e._, the ruling class. “The ‘Lords, chieftains or elders,’ offered their sons to the Calmecac to be educated for the priesthood.”

It being impossible to present here in full the data showing how certain primitive conceptions had developed further and how some human occupations had become associated with the Above and others with the Below, I will but point out the important fact that the city of Mexico, divided into four quarters, each of which had five subdivisions (calpullis), actually consisted of two distinct parts. One of these was Mexico proper, where the Great Temple stood and where Montezuma and the lords resided; the other was Tlatelolco, where the lower classes dwelt and the merchant class prevailed. After a certain revolt the inhabitants of this portion of the city were, we are told, “degraded to the rank of women” (see Bandelier, _op. et loc. cit._). From this it would seem evident that their affairs or lawsuits were settled in the official house named the Cihua-tecpaneca, whilst the affairs of the nobility, residing in Mexico proper, were disposed of in the Tlaca-tecpaneca (see Duran, chap. 3). Knowledge of the prevalence of the division of the population into two parts is gained through a passage of Ixtl-ilxo-chitl’s Historia (chap. XXXV, p. 241): “To Quetzalmemalitzin was given the lordship of Teotihuacan ... with the title of Captain-general of the dominion of the noblemen. All affairs or lawsuits of the lords and the nobility belonging to the towns of the provinces situated in the plain, were to be attended to and settled in his town. The same title was bestowed upon Quechaltecpantzin of Otompan, with the difference that he was the captain-general of the commoners and attended to the affairs and claims of the commoners and populace of the provinces in the plains.”

A further detail concerning the position of the ancient capital of Mexico should not be omitted, for it is described as follows by the English friar Thomas Gage, who visited it in 1625: “The situation of this city is much like that of Venice, but only differs in this, that Venice is built upon the sea-water, and Mexico upon a lake, which seeming one is indeed two; one part whereof is standing water, the other ebbeth and floweth according to the wind that bloweth. That part which standeth is wholesome, good and sweet, and yieldeth store of small fish. That part which ebbeth and floweth is a saltish bitter and pestiferous water, yielding no kind of fish, small or great” (p. 43). Added to other data, this detail seems to indicate that the geographical position of the capital had been chosen with utmost care and profound thought, so that, built on a dual island on a dual lake, it should be in itself an image or illustration of the ideas of organization which I have shown to have dominated the entire native civilization. If it be admitted, as I think is evident, that the site of the capital was chosen and mapped out in accordance with these ideas, then we undoubtedly have, in ancient Mexico, not only one of the most remarkable “Holy Cities” ever built by mankind, but also the most convincing proof of the great antiquity and high development of the civilization under whose influence one of the greatest capitals of ancient America was founded.

It is impossible to read the following descriptions without recognizing that the identical fundamental ideas had undoubtedly determined the native topography of capitals situated in other parts of the continent. Beginning with Guatemala, which formed a part of ancient Mexico, I refer to the plan of the ancient capital and its description by Fuentes of Guzman, published by Dr. Otto Stoll in his work already cited: “A deep ditch, running from north to south, divided the town into two portions. One of these, situated

to the east, was inhabited by the nobility; whilst the commoners (Macehuales) lived in the western division." I pause here to call attention to the intentional coincidence that the association of the east with the Above, and the west with the Below, is exemplified here, topographically. The plan shows that the eastern half contained, in its centre, a great, oblong enclosure, surrounded by a high wall. A wall, running from east to west, divided this enclosure into two distinct courtyards with wide separate entrances from the west. The northern courtyard, designated as the "Place of the Palace," contains several buildings. The southern one, named the "Place of the Temple," contains an edifice on a terraced mound and several others. It is noticeable that, in the exact middle of the central wall, there is a seemingly double, unfortunately indistinguishable object, or building, which marks the exact middle of the entire dual enclosure. It is particularly interesting that the East City is divided into two portions by a wall running from the southeast angle of the wall of the Temple courtyard to the outer wall of the city. The southern half, in which the "Tribunal or hill of justice is to be seen, is designated as containing the houses of the Ahauas or heads of the Calpuls." The northern half, containing many houses, lacks designation. The West city is likewise divided into two distinct portions by a broad street, enclosed by a hill wall and conducting from the western and only entrance to the city directly to the Place of the Temple. A deep trench or ditch encloses the entire city, whilst nine watch-towers, on small hills, are placed at equal distances around it.

If this precious document clearly reveals the ground plan on which the native capitals were built, in accordance with the dominant idea, the following native map shows that the ancient dominion of Yucatan, for instance, was figured as an integral whole with form of a flat disc divided into four quarters, Ho, the modern Merida, in its centre. This map, copied from the native Codex Chumazel, has been published by Señor Crescencio Carillo of Ancona in the Anales del Museo Nacional de Mexico, vol. II, p. 43, as showing the territorial division of Yucatan before the Conquest (fig. 27). According to Herrera and Diego de Landa, the unity of the dominion was destroyed about two centuries before the Conquest by the destruction of the capital, Mayapan. The land then remained divided amongst many independent chiefs or Bacabs. Señor Carillo renders the Maya descriptive text written under the map, as follows: "Here is Mani. The beginning of the land, or its entrance, is Campeche. The extremity of the wing of the land is Calkini; the (chun) place where the wing grows or begins, is Izamal. The half of the wing is Zaci; the tip of the wing is Cumkal. The head of the land is the city, the capital Ho."

[Illustration.]

Figure 27.

The foregoing text shows that, notwithstanding the circular shape in which it is figured, the dominion was evidently thought of as in the form of a bird, the head of which was the capital.

[Illustration.]

Figure 28.

This figure of speech seems to have been prevalent in Mexico also and to be conveyed by the representation, in the Vienna Codex, of a double tau-shape to which the head, wings and claw, and tail of a quetzal are attached (fig. 28, no. 8). As I shall have occasion to demonstrate further on, the double tau signifies the Above and the Below and their union forming an integral whole. The following Nahuatl terms explain by themselves the symbolism of the bird-figure: cuitlapilli=the tail of an animal or bird, atlapalli=the wings of a bird, or the leaves of a tree, cuitlapalli atlapalli=vassals, the populace or lower classes, the laborers.

These words furnish irrefutable evidence that the lower class was familiarly known in Mexico as "the wings and the tail" of the commonwealth or state, or the leaves "on the trees" of the tribe. Sahagun states, on the other hand, that the Mexicans employed the metaphor of "a bird with wings and a tail" to designate a lord, governor or ruler. He also records that the terms hair, nails, a thorn, a spine, beard and eyelashes, were used to signify "someone who was noble, generous or of the lineage of the lords." Such metaphors as these may well cause us to despair at arriving at a complete understanding of the native imagery and symbolism. The symbolism of the bird's claw yet remains to be looked into. The Nahuatl for the same is xo-maxaltic, xo-tzayanqui or cho-cholli.

In one of the ancient Mexican harangues, previously quoted, it is said of the supreme ruler that he had been given "fangs and nails" in order to inspire fear and reverence. Scattered evidence and the fact that in the Codex Mendoza the decorated claws of an eagle, for instance, appear as a military device on the shields of certain war chiefs, seem to indicate that the warriors were spoken of, metaphorically, as "the claws or nails" of the state. The following passage finally proves that the tlachtli or courtyard the shape of which was a double tau, as in fig. 28, no. 8, was regarded by the Mexicans as an image of the state itself. In another native harangue it was said of the newly-elected ruler: "He is now placed or put into the Tlachtli, he has been invested with the leathern

gloves, so that he can govern and throw back the ball to the one who throws it to him in the game. For the business of governing very much resembles this game and the game of dice" (Sahagun, book VI, chap. xiii). The latter game alluded to, the patolli, was played on a mat in the shape of a cross, marked off with divisions, with stone markers, the moves of which were decided by the numbers obtained on casting the dice, which consisted of beans with marks on them. It is interesting to find that the word pat-olli seems to be connected with the verb pat-cayotia=to be substituted in the place of another, or to succeed another in office or dignity. The above comparison of the game to the business of governing indicates that a feature of the government was a methodical succession or rotation in office or dignity, a point to which I draw special attention, as I shall refer to it later.

The evidence that the Mexicans regarded the form of the courtyard, named tlachtli, as that of the state itself is noteworthy. On the other hand, the native map contained in the Codex Mendoza, p. 1, shows us that they figured their territory as a square, surrounded by water and divided into four equal parts by diagonal cross-streams or canals. As in the Maya map the centre of this is occupied by the well-known hieroglyph or rebus of Te-noch-ti-tlan, the ancient capital, which consisted of Mexico and Tlatelolco. In three of the four triangular divisions, two chieftains are figured, whilst in one there are four, the complete number of chieftains thus being ten. The incontrovertible evidence that the dominion of the Mexicans, as well as that of the Mayas, was figured and regarded as an integral whole has seemed to me to be of extreme importance, because it points to a fresh interpretation of the much-discussed meaning of the name Tullan, "the glorious centre of culture where the high priest Quetzalcoatl, had dwelt and whence he had been driven by the wiles of his enemies. It is a place that we hear of in the oldest myths and legends of many and different races. Not only the Aztecs, but the Mayas of Yucatan and the Kiches and Cakchiquels of Guatemala, bewailed in woful songs, the loss of that beautiful land and counted its destruction as the common starting-point in their annals.... According to the ancient Cakchiquel legends, however, ... 'there were four Tullans, as the ancient men have told us.' The most venerable traditions of the Maya race claimed for them a migration from Tullan in Zuyva."... "When it happened to me," says Friar Duran, "to ask a [Mexican] Indian who cut this pass through the mountains or who opened that spring of water or who built that old ruin? the answer was: The Tultecs, the disciples of Papa," _i. e._, Quetzalcoatl. (See Brinton, American Hero-Myths, p. 88.) Considering that the identity of Tullan has not yet been satisfactorily established, that several Tullans are said to have existed and that a small town, about a dozen leagues to the northeast of Mexico, is named Tullan-tzinco=little Tullan, I should like to direct the attention of Americanists to the following Maya words: Tul-um=fortification, edifice, wall and enclosure. Tula-cal, Tuliz, adjectives=whole, entire, undivided, integral. Tul-ul, adjective=general, universal. Tul-tic, verb=to belong, to correspond to something. Tul=all around or full. Tul=in composition, to have abundance. Tulnah=to be too full, to overflow, to proceed, to issue, abound, high-tide. Tulaan=past participle of tul.

I am of opinion that, after carefully examining the foregoing words and their meanings, we must admit that an intelligible and satisfactory derivation and signification of the much-discussed Tula of the Mexicans, which has been vainly sought in the Nahuatl language, are obtained if we connect it with the Maya words for fortress, or stronghold, an enclosed place, an integral whole, an overflowing source of abundance and plenty. If we do this, then the problematic term Tolteca, given by Mexicans to the superior people from whom they had derived their culture and knowledge, means nothing more than such persons who had belonged (Maya verb tultic) or were members of a highly cultured commonwealth or ancient centre of civilization, such as had flourished during countless centuries, in Yucatan and the present Chiapas, Honduras and Guatemala.

Reserving this subject for future, more detailed, discussion, I point out that the name Ho, given to the capital, which is designated in the map as the "head of the land," is obviously derived from the Maya hol, hool, or hoot, which means not only head but also chieftain. The circumstance that a single word, Ho, conveyed the triple meaning of a capital, a chieftain and a head, is particularly noteworthy, as it affords not only important clues to native symbolism, which I shall trace later on, but also shows that the presence of the syllable Ho or O, in certain native names of localities, may possibly indicate that it was a capital, the residence of a chieftain. Further light is shed upon the following native association of ideas when the following words are studied. The ancient Maya name for a pyramid or artificial mound was ho-m and the pyramidal elevations on which temples or palaces were built were designated as ho-mul or o-mul (see Vocabulary, Brasseur de Bourbourg). The title Holpop was moreover that of the "chieftain of the mat," whose prerogative it was to sit on a mat and to beat the sacred drum during the public dances or ritual performances (Cogolludo). The ancient word for vase, vessel or cup in general was ho-och, whilst o-och meant food or maintenance (Arte de la lengua Maya, Fray Beltram de Santa Rosa, ed. Espinosa, Merida, 1859). If the foregoing data be summarized we find that the word ho, the ancient name of the head of the land, which is figured in its centre, is not only homonymous with capital and chieftain, but also with pyramid, vase or receptacle and maintenance, and finally with the numeral 5, also "ho." We shall see that the identical ideas were similarly associated in ancient Mexico.

Referring once more to the ancient map of Yucatan and to the peculiarity that the head of the figurative bird, the capital, Ho, is supposed to occupy the centre of the state, I point out nos. 1 and 5 (fig. 28) from the Bodleian and Selden MSS. as somewhat analogous representations of a central capital or chief, and nos. 3 and 6 as possibly being images of a territorial subdivision of the state, resembling a spider's web. In an unpublished Mexican MS., which has been recently brought to light, the middle of the concentric circles is painted blue and suggests the idea of a system of distribution or irrigation, proceeding from a central supply of water and radiating in all directions. An accentuation of centrality is brought into relief in fig. 28, no. 6, where the spider's web is placed in the middle, between the two peaks of a mountain. In no. 2 a small quadruple sign, which frequently occurs in the Vienna Codex, always painted in the colors of the four quarters and united by a cross-band across the centre (no. 4). also figures between two peaks, above two feet, the significance of which I do not venture to determine. A remarkable circular disc resembling the Maya map, and also divided into four parts by cross lines, but exhibiting footsteps denoting rotation, is represented in the entrance of a temple, in the Vienna Codex (fig. 28, no. 7). These figures will be referred to again further on.

Let us now bestow attention upon the names of the Mexican capital and first note that the edifice of the Great Temple, in which the Cihuacoatl performed an annual ceremony already mentioned, was called tlal-xic-co, literally "in the navel of the earth or land" (from tlalli=earth, land or country, xictli=navel and co=in) (Sahagun, book II, appendix). Besides this edifice there was, in the middle of the lagoon of Chalco, an island, which, to this day, bears the name of Xico=in the navel or centre. This indicates the curious circumstance that the edifice and island had apparently been regarded as forming "ideal centres," and shows that the name of Mexico itself may have been associated with the same conception being, as it was, the central seat of government. Gomara states that "the city was divided into two halves or parts, one named Tlal-telolco=small island (literally, 'in the earth-mound') and the other named Mexico, which means 'something which flows,' " (Histoire Généralle des Indes, Paris, 1634, chap. 38). The Nahuatl word alluded to can be no other than the verb memeya which, according to Molina, signifies "water, or something liquid which issues or flows in many directions." I have already pointed out that the Maya words to express water which rises and overflows, high tide and, by extension, abundance and plenty, are tul, tulnah and, finally, tulaan, past participle of tul. If the particle "me" conveyed the above idea, its combination with xico would cause the name Mexico to be replete with significance and to mean "the figurative centre whence all maintenance proceeded and flowed in all directions, throughout the land."

The Borgian Codex furnishes representations of identical meaning. On page 4 a human body, the centre of which forms a large red disc, is stretched across the double tau-shaped tlachtli which obviously represents the four quarters, being painted with their four symbolic colors. It is particularly noteworthy that the limbs of the central figure are represented as wearing the green skin of a lizard, while its face is enclosed in the open jaws of the reptile. It should also be noted here that whilst the Nahuatl names are cuetz-palin and topitzin, the Maya term for lizard is mech or ix-mech. On the same page a similar, but smaller, figure is depicted on a background representing the nocturnal heaven. On the following page the figure of a dead woman is stretched on a red disc whilst a priest is drilling the fire-stick into a circular symbol, with four balls, which is the well-known symbol for chalchiuitl=jade. As the name of the female water goddess is Chalchiutlycue, this detail is significant and will be referred to later on. It is noteworthy that on both pages 5 and 6 the performance of the above rite is accompanied by the image of the goddess of the earth and underworld, represented with a death's head, and with her hair strewn with stars. Her body is that of a green lizard, and she carries ears and blossoms of maize and holds a blue garment on which the chalchihuitl symbol figures.

In connection with representatives of the human form outstretched in sacrifice, on whose body the rite of kindling the sacred fire or of extracting the heart is being performed, it seems evident that, under the dominion of the fundamental ideas I have been discussing, the native sages regarded and utilized the human form as an image of the Middle and Four Quarters. It is well known that the number 20 was termed "one count" and connected with the number of fingers and toes, distributed equally on his four extremities. The human victim thus formed a living swastika or cross and became not only the consecrated image of the supreme, creative, central divinity who controlled the Four Quarters, but also an image of the central government with its supreme ruler; whilst the four chiefs of the Quarters were symbolized by the four limbs. Each of these terminated in a symbolized group consisting of a hand, maitl, with a thumb (=touey mapilli or vei mapilli, literally, the great finger, or our great finger) and four fingers (mapilli); or of a great toe, touei xopil or topec-xopil (literally, our great toe, or our lord toe) and of four toes=xopilli.

[Illustration.]

Figure 29.

The above association of ideas was doubtlessly accentuated by the fact that the word pilli means a nobleman, a chieftain; thence he terms pilconetl=the son of a nobleman and pilhua=he who has sons (pil in this case meaning son and hua=possessor of). This

latter fact could have been very aptly conveyed in the picture-writings by employing fingers to express the sound “pilli.” The number of sons a chieftain had could thus be easily expressed by his exhibiting a corresponding number of fingers. I shall revert to this possibility presently, and now referring to fig. 29, no. 2, direct attention to the obvious intention to express the idea that the fire produced was distributed to the four quarters by means of the figures, painted in symbolical colors, three of which are visible. Another picture in the same Codex represents four similar figures springing towards the cardinal points from a source or fountain of water, whilst a priest above a triangular cloak(7) holds a pair of weapons (?) in his hands (fig. 29, no. 1). If carefully studied, these groups seem to corroborate the derivation of the name Mexico, given above. What is more, the first group affords an explanation of the meaning and purpose of three strange recumbent stone figures bearing circular vessels, which have been respectively found in Mexico, Tlaxcala and Chichen-Itza and are now preserved at the National Museum in Mexico. They furnish the most convincing proof that an identical cult and symbolism had existed in these widely-separated localities. The conclusion I have previously expressed, that an actual connection had been established between Chichen-Itza and Mexico by the Maya high priest Kukulcan, or Quetzalcoatl, is thus corroborated by undeniable evidence, which will be supplemented later on.

The three monoliths have been described and illustrated in the Anales del Museo Nacional, Mexico, vol. 1, p. 270, by the late Señor Jesus Sanchez, and are here reproduced. The statue exhumed at Chichen-Itza by Dr. Le Plongeon (pl. IV, fig. 1) closely resembles that found at Tlaxcalla in Mexico (pl. III, fig. 2). Dr. Brinton, who erroneously describes the Chichen-Itza statue as representing “a sleeping god,” points out the extremely important fact that there was a divinity worshipped in Yucatan called Cum-ahau, “the lord of the vase,” who is designated in a MS. dictionary as “Lucifer (the lord of the underworld) the principal native divinity.” He adds there is good ground to suppose that this lord of the vase ... was the god of fertility common to the Maya and Mexican cult (Hero-Myths, p. 165). Considering that the great market-place in the capital was actually the centre to which the entire product of the land was periodically carried from its remotest confines, was there classified, exchanged or distributed far and wide, the comparison to a central flowing source of maintenance was most appropriate.

That some particular spot in or near the city should have gradually assumed importance and sanctity as marking the exact centre of the metropolis, _i. e._, of the integral whole of the Mexican “empire” is but natural and it is not surprising to find that solemn rites were performed on this spot. In one of the chronicles to which I shall revert, it is stated that the New Fire was at times kindled on the prostrate body of a slave, and this curious statement is corroborated by a picture in the Borgian Codex, showing a priest producing fire from a circular vessel placed on the body of a victim beneath whom a face enclosed in the open jaws of a reptile, is visible (fig. 29).

[Illustration.]

Plate IV.

Dr. Le Plongeon, to whom much credit is due for its discovery, identified the Chichen-Itza statue, for reasons not fully explained, as a portrait of Chac-Mool, or Lord Tiger, and relates that it was found at a depth of eight metres, not far from the base of the Great Pyramid Temple. A statue of a standing tiger, with a human head and a shallow depression in its back, was also found near the same spot. I have seen other sculptured figures of human beings holding a vase, as at the hacienda near Xochicalco, Mexico, and of tigers, with circular depressions on their backs, and hope to be able to reproduce their photographs on another occasion.

The most elaborately sculptured recumbent statue is undoubtedly that which was found in or near the city of Mexico (pl. IV, fig. 3). The under surface of its base (pl. IV, fig. 5) is entirely covered with zigzag water lines and representations of roots of plants, figured as in the Codices; shells, one kind of which is the well-known symbol of parturition, and frogs which are intimately associated with water symbolism. On the hair of the statue a flower-like ornament is carved (pl. IV, fig. 4) in connection with which it should be noted that the Nahuatl for flower is xochitl, pronounced hoochitl, resembling the Maya hooch=vase. The small groups of five dots forming a border around the circular vessel are noteworthy, as they are likewise sculptured on the calendar-stone. The characteristic scrolls about the eyes of the figure show that it personates tlaloc, or earth-wine. The fertility of the earth, caused by rain, is symbolized by the wreath of ears of corn and reeds (Nahuatl, _tollin_) which is sculptured around the base of this, one of the most remarkable of ancient American monuments.

Señor Sanchez cites Torquemada (Monarquia Indiana, vol. II, p. 52) as the only authority who mentions a recumbent image or idol and relates that, “in the city of Tula, there was preserved in the great temple, an image of Quetzalcoatl ... he was figured as lying down, as though going to sleep.... Out of reverence the image was covered with mantles or cloths.... They said that when sterile women made offerings or sacrifices to the god Quetzalcoatl, he immediately caused them to become pregnant....” He was the god

of the Winds which he sent to sweep or clear the way for the tlaloques="the earth-wine" gods.

Señor Sanchez also quotes Gama, who, basing himself upon Torquemada's authority, maintains that Tezcatzon-catl, the principal rain or octli-god, was figured as lying in an intoxicated condition, holding a vase of pulque in his hands. To the above data I add the description by Bernal Diaz, of a "figure in sculpture" he saw on the summit of the great temple of Mexico: "It was half man and half lizard (lagarto), was encrusted with precious stones and one-half of it was covered with cloths. They said that half of it was full of all the kinds of seeds that were produced in the entire land, and told [me] that it was the god of sown land, of seeds and fruits. I do not remember his name...." (Historia Verdadera, p. 71). It may be as well to note, that the Nahuatl names for lizard, cuetz-palin and topitzin, approximately convey the sound of the first syllables of the name of the culture-hero Quetzalcoatl, and of the title "topiltzin" bestowed upon him. It must, of course, remain a matter of conjecture whether the lizard was possibly employed in the above case as a pictograph, to express the sound of its name. One thing seems certain, that the Tula image of Quetzalcoatl, to which divinity barren women directed their invocations, and the statue described by Bernal Diaz as that "of the god of seeds, fruits and cultivated land," were undoubtedly analogous to the sculptured recumbent figure found in Mexico, and exhibiting the symbols of Tlaloc, or earth-wine, of maize, and of parturition. Bernal Diaz further relates that the said image was kept on the uppermost terrace of the Great Temple, in one of five "concavities surrounded by barbacans or low walls the wood-work of which was very richly carved" (_op. et loc. cit._).

The inference to be drawn from the foregoing data is that the Mexicans and the Mayas habitually kept, on the summit of their principal temple, in their centres of government, a statue holding a circular vessel and figuratively representing the "navel or centre of the land." The group of ideas already traced in the Maya ho=capital, hom=pyramid, ho-och=vessel, o-och=maintenance, ho=5, thus proves to be completely carried out, for, on this consecrated spot, which emblematized the source whence all life proceeded, sacred emblematic rites were performed, the purpose of which was to typify the union, in the centre, of the four elements requisite for the productiveness of the earth.

[Illustration.]

Figure 30.

The ground plan of the Caracol or Round Temple of Chichen-Itza, which was built, according to tradition, by the high priest Quetzalcoatl, carries out the idea of the middle and of the four quarters in so obvious a manner that it may safely be assumed that it represented the supposed centre of a dominion (fig. 30). Referring the reader to the interesting description of this remarkable edifice in Mr. William Holmes' valuable work already cited, I note that round temples, dedicated to Quetzalcoatl, are recorded to have also existed in Mexico. It seems probable that, at certain festivals, the living representatives of the Above and Below performed certain sacred rites on the summit of one of these circular edifices. It is obvious that such rites could only have been fitly performed by the coöperation of both twin rulers or Quequetzalcoas, each of whom personified two elements. The appropriate season for such rites would be that when the necessity of insuring a successful harvest would seem most urgent. It is a recorded fact that the most solemn festivals of the year were held between the vernal equinox, on which date the ritual year began, and the fall of the first rain which usually occurs about the middle of May. It is extremely significant that at this precise period the festival toxcatl took place (_cf._ Maya thoaxol or thoxol=distribution, giving each one a little, and o-och=food or maintenance) during which Tezcatlipoca and Huitzilopochtli were jointly honored. During this festival the "sacred dough," named tzoalli, was a prominent feature of the ritual and it was undoubtedly associated with the idea of the life-giving union of the four elements, the Above and Below, or the male and female principles.

It can, moreover, be directly connected with the recumbent statues representing the centre; for, whilst Bernal Diaz recorded that the statue on the summit of the Great Temple held a collection of all the seeds of the land, Cortés, in his descriptive letter, gives us an important detail which evidently applied to the identical statue. He relates that "the bodies of the idols are made of a dough consisting of all the kinds of seeds and vegetables that these people ate. These are ground, mixed with each other and then moistened with the blood of the hearts of human victims ..." (_op. cit._ p. 105). Sahagun relates that an image of the earth goddess, under the title of Seven-serpents or twins, was made of this sacred dough and that offerings of all kinds of maize, beans, etc., were made before it "because she is the author and giver of all these things which sustain the life of the people" (book II, 4). It is well known that the dough images were broken into small pieces and these were distributed to the priests and people, who partook of the substance after having prepared themselves by fasting, for the sacred rite. I draw attention to the fact that the above sacred substance is but the natural outcome of the primitive notion already mentioned, which led the hunters to spill blood upon the earth, to obtain its increased fruitfulness. An insight having been thus obtained of the origin of blood sacrifices in ancient America, it is

possible to understand the meaning of certain representations showing the performance of ritual blood-offerings.

On the well-known bas-relief preserved in the National Museum of Mexico, and illustrated in the Anales (vol. I, p. 63), the two historical rulers of ancient Mexico, who figure as Quequetzalcoas, or divine twins, in exactly the same costume, are sculptured with blood flowing from their shins and in the act of piercing their ears with a sharp bone instrument. Two streams of blood descend from these and meet before falling into the open jaws figured beneath an altar, on which two conventionalized flowers appear. The two rows of teeth=tlantli, convey the sound of the affix tlan=land of, or tlalli=earth. But the most remarkable and striking instance of the group of ideas we have been studying is found on p. 62 of the Borgian Codex. On a background formed by a pool of water, there is a group which represents the "earth-mother" lying on a band of lizard-skin, with two maize plants issuing from her body and growing into a large two-branched tree, in the centre of which is a flint-knife or tecpatl. A bird stands on its summit and its branches terminate in maize plants. Its growth is being furthered by the two streams of blood which proceed from two human figures, standing at each side of the tree. One is painted black and evidently represents the Lord of the Below; the other is painted blue-green and represents the Lord of the Above. The blood-sacrifice they are jointly offering is that mentioned in the "Lyfe of the Indians," as performed in order to obtain generation. Unquestionably this symbolical group would have been equally intelligible to Mayas or Mexicans, since the ideas it expressed were held in common by both people.

Before proceeding further it is necessary to state that after the native philosophers had, for an indefinite period of time, been satisfied with the artificial division of all things into four quarters, corresponding to the cardinal points and elements, the idea of the Above and Below gradually grew in importance, whilst prolonged thought and observation disclosed that the above classification demanded revision. On carefully investigating the attributes of the principal ancient Mexican deities or personifications of the elements we see that the native thinkers had found themselves obliged to make a distinction between the different forms of each element, having realized, for instance, that water not only fell to earth from the heaven, but also issued from the depths of the earth in the form of springs or fountains, and formed rivers and lakes. The final conclusions they reached in this instance are best explained by the fact that the name of the god Tlaloc means earth-wine or rain only, and that his sister "Chalchiuhtlycue" appears as the personification of wells, springs, rivers and lakes. It is evident that the classification of the ocean or sea must have given rise to much serious thought. We know how the problem was solved by the fact that the Nahuatl name for the ocean is "ilhuica-atl"=heaven-water. Accordingly, the rain and the ocean pertained to the heaven, the Above and male principle, whilst the wells, springs, rivers, etc., belonged to the earth, the Below, the female principle.

As in this case, so it was with the other elements, each of which was finally personified by a male deity and his female counterpart, which, in some cases, tended to represent its distinctive and beneficent properties. As these deities are separately treated in my commentary of the "Lyfe of the Indians" and lack of space forbids my discussing them here, I shall but mention that the ultimate native systematization of the elements, each of which was thought of as an attribute only of supreme and central divinity, corresponds exactly to that held by the Zuñis of to-day and set forth in the following account given by Mr. Frank H. Cushing and quoted in Dr. Brinton's "Native Calendar of Central America and Mexico" (p. 8). In quoting it I draw special attention to the numerical divisions given, as this is absolutely essential for the understanding of the statements I shall make, further on, concerning the origin of the native Calendar-systems.

[Illustration.]

Figure 31.

"In the ceremonies of the Zuñis the complete terrestrial sphere is symbolized by pointing or blowing the smoke to the four cardinal points, to the zenith and nadir, the individual himself making the seventh number. When the celestial is also symbolized, only the six directions are added to this seven, because the individual remains the same, so that the number typifying the universe, terrestrial and celestial, becomes 13. When, on the other hand, in their ceremonies, the rite requires the officiant to typify the supra- and intra-terrestrial spheres, that is, the upper and lower worlds [the Above and the Below], the same number 13 results, as it is held that in each the sun stands for the individual, being in turn the day sun and night sun, the light and dark sun, but ever the same and therefore counts but once."

After having gained this knowledge of native speculative philosophy, let us penetrate still further into their modes of thinking by studying, first of all, a series of symbols of the earth-mother taken from one of the most valuable of Mexican MSS., the Vienna Codex (fig. 31). In these the idea of the vase, bowl or receptacle and of the serpent predominates. It is instructive of native thought to find the vase represented as containing a child (no. 1), an agave plant (no. 7), a fire, denoting warmth (no. 3), a flower (no. 12),

and a bunch of hair, the numerical symbol for multiplicity=the number 400 (no. 5). In no. 2, the hollow between two recurved peaks conveys the idea of a central vase; a band with eyes rests upon the peaks and denotes the heaven. No. 4 shows a double vase, enclosed in a similar representation of the nocturnal heaven—the idea to be conveyed being evidently that of a receptacle hidden in darkness. No. 9 displays an open jaw, two claws, a human heart and a stream of blood issuing from it. Nos. 10 and 11 present different shapes of the serpent's jaw, the symbol of the earth.

The double-headed serpent forming a vase containing a flower (no. 12) is particularly interesting because the flower=xoch-itl in Nahuatl, seems to suggest an intentional likeness to the Maya word for "vase, vessel or cup in general," ho-och (Arte de la lengua Maya, Fray Pedro Beltran de Santa Rosa, ed. Espinosa, Mérida, 1859) as well as hoch or o-och="food and maintenance." The symbolical vase-like opening in the core of the agave plant, (no. 8) is such as is made to this day, in order to collect the juice, which, when fermented, constitutes the sacred wine of the ancient Mexicans, octli, now better known as pulque.(8) As will be shown the Mexicans considered this as "the drink of life." Its use was rigidly regulated and supervised by the "octli-lords" or "rain-priests" who distributed it at certain dances, in order to induce a state of mild intoxication amongst the participants.

As in the case of the Zuñis and Tarahumari Indians of the present day, referred to by W J McGee, in his valuable and instructive article on "The beginning of Marriage" (the American Anthropologist, vol. IX, no. 11, p. 371), "certain ceremonials typifying the fecundity of the earth and of the leading people thereof" were performed by the ancient Mexicans. These public ceremonials had also been "apparently developed to the end that the tribes and peoples might be encouraged to increase and multiply and possess the fecund earth." They took place at the period of the year when the heaven and earth were also supposed to unite, _i. e._, at the beginning of the rainy season. During this the ordinary out-door occupations of the agriculturist and hunter were forcibly interrupted and the regular and periodical transportations of produce and tribute to the capital became impossible, owing to torrential rain, swollen rivers and impassable roads. This period of enforced shelter and confinement indoors seems to have become the definite mating season of the aborigines. At the same time the union of the sexes had obviously assumed a sort of consecration since it was intimately associated with the cosmical, philosophical and religious ideas and coincided with what was regarded as the annual union of the elements or of the Above and Below, the heaven and earth.

At that period of its history, when the Aztec race was jointly governed by a priest, personifying the heaven and a priestess, "his wife and sister," who personified the earth, some form of sacred marriage rite must have been annually performed. The consecrated character of their union must have naturally caused their offspring to be regarded as of a holy and almost divine origin. It is easy to realize, therefore, how, in ancient Mexico, the artificial idea of "superior birth" came into existence, how a family or caste of rulers gradually developed, the members of which were entitled "teotl"=divine, whilst the men were regarded as "the sons of Heaven" and the women "the daughters of Earth." It is obvious from this that the periodical union of the sexes, accompanied as it was, by sacred dances and the distribution of sacred wine, must have gradually assumed a semi-religious character, whilst the ritual nuptials of the "divine" rulers, typifying, as it obviously did, the grand and impressive phenomenon of the rainy season, must have caused this marriage to assume the character of a hallowed rite and surrounded it with the most elevated and intense religious sentiments of which the native mind was capable.

After this recognition of the diverging influences which guided the development of primitive marriage institutions, we will return to the rain-priests or "octli-lords," of whom it is repeatedly stated that there were four hundred, a number corresponding to an assignment of 100 or 5×20 to each of the four provinces or divisions of the commonwealth. Their emblem was the sacred vase or receptacle and in the "Lyfe of the Indians" this will be seen figured on their mantas and shields (no. 6_a_). A small gold plate, of the same shape, is represented as worn by these "lords," attached to the nose (no. 6_b_); and, in the same MS., the symbolical ornament is also carried by the "sister of Tlaloc." It was evidently worn, like similar ornaments in other countries, hanging from the septum of the nose, and seems to have indicated a consecration of the breath as the substance of life. As an inference, merely based on an insight gained into the native modes of thought, I suggest that the explanation for the adoption of this ornament may have been the religious idea that the breath of life, dividing itself as it issues through the nostrils and uniting when inhaled, appeared to the native thinkers as a marvellous illustration of unity and duality, both ideas having constantly been present in their minds.

[Illustration.]

Figure 32.

In the Vienna Codex there is a remarkable picture of the earth-vase resting on a slab with five divisions. A profusion of puffs or breaths of air or vapor issue from it and, branching off in two directions, form what is like the conventional tree of life, also met with in Maya bas-reliefs and documents. At the extremities of the branches which turn downwards, a serpent's eye is visible and a forked-tongue issues above the middle (fig. 32, no. 1). The intention to express an exuberant vitality and growth issuing from the symbolical vase in the centre of the earth, seems obvious. This idea is still more clearly conveyed, however, in two symbolic pictures on pp. 21 and 29 of the Codex Borgia, which are reproduced as nos. 1 and 4 in fig. 1 of this publication. The first represents the vase overflowing with water and containing a flint-knife, the generator of the vital spark. The central group is surrounded by water and by sun-rays and obviously symbolizes the union of air, light and water, constituting the Above, with the flint the emblem of the earth-mother and of Tezcatlipoca, the lord of the Under-world. Fig. 1, no. 4, represents the vase overflowing with a liquid, which is designated as being the sacred octli or earth-wine by the presence of the rabbit, which expresses the sound of its name=tochtli. This rebus is surrounded by the nocturnal heaven strewn with stars and the reference to the union of rain or earth-wine with earth and darkness is evident. It has been generally assumed that these images of the vase, containing the rabbit or flint-knife, represented the moon. As the latter was intimately associated with the cult of night, of the earth-mother and ideas of growth, it is not impossible that by an extension of symbolism, this was the case, but only in the same way as the sun was the emblem of the cult of the Above. On the other hand the native drawings of the moon in Sahagun's Academia MS. represent it as a crescent with a human profile on the inner side, and in a specimen preserved at the Trocadéro Museum, Paris, it is similarly carved in rock crystal.

Before proceeding to investigate the symbol further, I would point out the general resemblance of the vase, especially as a conventionalized serpent's jaw, to the "horse-shoe" shape of the problematical stone "yokes" which have been so thoroughly studied by Dr. Hermann Strebel of Hamburg (Studien ueber Steinjoche aus Mexico and Mittel-Amerika. Internationales Archiv, bd. III, 1890). Mr. Francis Parry has advanced a view concerning the meaning of these curious "sacred stones."(9) This is somewhat corroborated, as will be shown, by my recent studies, which seem to indicate pretty clearly that these symbolical objects pertained to the cult of the earth-mother. A fact of unquestionable importance, cited by Mr. Parry, is the certified existence and use, amongst southern Californian Indians of the present day, of a rudely worked stone of the same shape, in a native religious rite. The owner of one of these stones, Mr. Horatio Rust, a pioneer resident of Pasadena, southern California, exhibited it in the Anthropological Section of the World's Columbian Exposition, at Chicago, 1893, and informed me how he had observed that, occasionally, a native assembly took place at a certain spot on a mountain side, during which invocations and offerings were made. He ascertained that the ceremony on one occasion was the equivalent of the puberty-dances of similar California tribes. Having visited and examined the spot after one of these celebrations, in which six young girls, decorated with garlands of flowers, were the chief participants, he found the "sacred stone," concealed and surrounded by offerings of corn, meal and pieces of money. The version published by Mr. Parry is slightly different to this account, which was given me by Mr. Rust himself.

In order fully to appreciate the close analogy between the Californian ceremonial offering of maize and meal to the emblematic stone and the ancient Mexican ritual offerings of seeds to an idol, holding a bowl or vase, it is necessary to read the following data. At the same time I would like to mention here that amongst the Hupa Indians of California, who have been termed "the Romans of Northern California by reason of their valour and far reaching dominions," we find that "flakes or knives of obsidian or jasper, sometimes measuring 15 inches or more in length, are employed for sacred purposes and are carried aloft in the hand in certain ceremonial dances, wrapped with skin or cloth. Such knives are esteemed so sacred that the Indians would on no account part with them, and Mr. Stephen Powers found that they could not be purchased at any price."(10)

It is scarcely necessary to recall here that the flint-knife was a well-known ancient Mexican emblem, nor to point out the importance of the conclusion that two well-defined symbols which played an important rôle in the Mexican and Mayan cult of the Below and of the Earth-mother, are actually found in use amongst Californian Indians at the present day.

A whole flood of light is thrown upon native symbolism, however, by the information obtained from the Zuñi Indians by Mr. F. H. Cushing. The following passage, from their Creation myth, affords the most positive confirmation of the foregoing conclusion, that the bowl or vase was the native emblem of the earth-mother. The Zuñi speaker said: "Is not the bowl the emblem of the Earth, our Mother? For from her we draw both food and drink, just as the babe draws nourishment from the breast of its mother. And round, as is the rim of the bowl, so is the horizon...."(11) Interesting as this explanation of the native symbolism undoubtedly is, it becomes most important when its full significance is realized and we recognize that originally earthenware bowls themselves were looked upon as sacred emblems formed indeed out of the material of the earth itself. This fact places the invention and manufacture of earthen vessels in an entirely new light and enables us to conjecture and understand why, quite apart from their utility, so much

care and decoration were lavished upon them and why, indeed, they were constantly buried with the dead. They obviously served as sacred emblems of the earth-mother, to whose care the dead body was confided, and originally the intention probably was to propitiate her by the beauty of the sacred vessels, which, to be symbolical of her bounty, necessarily contained food and drink.

Without pausing to discuss how easily this custom would have gradually given birth to the belief that the food and drink thus offered were intended for the use of the dead body itself, or its soul, I would point out that, in the absence of clay vessels, a stone, rough or worked, would have also served as an appropriate emblem of the earth-mother, being as it were, of her own substance. It is well known that in ancient Mexico this custom prevailed. There we also find that the bowl- or vase-shaped grave was employed, with a deeply religious and symbolical meaning. This is clearly revealed by a native drawing in the “Lyfe of the Indians,” representing a native burial. The deceased, represented by his skull only, has been placed in a deep hole, figured as a large inverted horse-shoe, painted brown and covered with small “horse-shoe” marks. The same religious symbolism which led to the adoption of a definite form of sepulchre, typifying the element earth, would evidently account for the adoption for burial purposes, of large clay vessels into which the remains of the dead were placed. In some localities these clay burial urns were, as we know, made large enough to contain the dead body itself. The difficulty of manufacturing these would naturally have led to the general adoption of cremation, simply as a means of reducing the remains so that they could repose in the sacred image of the earth. Cremation would, moreover, be a rite full of meaning since, to the native mind, earth was inseparable from its twin element fire, and both together constituted the “Below.”

It is significant to find, however, that the ashes of Montezuma’s predecessors had not been finally consigned to the earth. In strict accordance with their association with the Heaven and Above, their remains were never allowed to come in contact with the earth, but were usually preserved inside of a hollow wooden effigy of the deceased, which was dressed in his insignia and placed in a high tower, built for the express purpose. Cortés states that there were “forty very high towers” in the enclosure of the Great Temple of Mexico and that “all of these were sepulchres of the lords” (Historia de Nueva-España, ed. Lorenzana, pp. 105 and 106). Whilst it is evident that the remains of all lords and priests of heaven should thus be assigned a place of rest high above the earth, it is equally intelligible that the bodies of the lords and priests of the Below and all women should be consigned to the interior of the earth and by preference in caves. The Codex Féjérvary contains an interesting picture of the tied-up body of a woman, recognizable as such from the head-dress and her instrument of labor, the metlatl, on which the maize is ground. The mummy rests inside of a flat effigy of a serpent’s head, which seems to be carved in wood or stone and closely resembles fig. 31, no. 11. It is worth considering whether the carved stone-yokes may not have served in connection with the funeral rites of the consorts of rulers or high priestesses or priests of the Below.

If investigations of the vase or earth symbols are extended to countries lying south of Mexico, traces of the existence of an analogous cult are observable. There undoubtedly exists a striking resemblance between the form of the characteristic and peculiar stone “seats” which have been found in such numbers in Ecuador, to the vase, fig. 31, no. 3, for instance. The employment of these symbolical stones as a consecrated central altar or, possibly, as the throne of the living representative of the earth-mother, would have harmonized with the native ideas which have been traced on the preceding pages.

It was also extremely interesting to me to find the identical symbol in the Maya day-sign Caban, which has been identified by Dr. Schellhas and Geheimrath Förstemann as a symbol of the earth and is figured on p. 99 of Dr. Brinton’s Primer of Mayan Hieroglyphics. In the sign Caban, the horse-shoe mark is accompanied by a series of dots which seem to indicate liquid trickling from the receptacle and permeating the soil, an idea which is strictly analogous to the much more elaborate Mexican images of the vase full of rain or “earth-wine,” fig. 1, nos. 1 and 4, which, in cursive form, was employed as the emblem of the pulque, or octli lords, the priests of the earth. It is strikingly significant to find that in the Maya Codices the drops issuing from the horse-shoe are sometimes figured as trickling into the mouths of “divinities” whose faces also exhibit images of the sacred vase, analogous to that of the Mexican “octli-lords.”

These Maya divinities have been designated by Dr. Schellhas as god L, whose face is painted black and under whose eye a vase is painted, a peculiarity termed by Maya authorities “an ornamented eye” and which may be seen in fig. 33, iv; (2) as god M, “a second black god,” whose eye is likewise enclosed in a vase and whose hieroglyph is a vase on a black ground; and (3) as god C, of whom I shall subsequently speak in detail. (See Brinton’s Primer, pp. 122 and 124.) In the case of god L, the two horse-shoe marks from which drops are falling into the mouth of the god, are surmounted by the glyph imix, to which I shall revert.

[Illustration.]

Figure 33.

The horse-shoe mark with drops likewise occurs in the design resembling the akbal glyph, which has been interpreted as connected with akab=night. It also occurs, in Maya Codices, on bands exhibiting cross-symbols, sometimes in an inverted position and hanging from above and sometimes standing on two of the three mounds which are a feature of these interesting glyphs. Postponing a detailed discussion of these, I will but emphasize here that, in the Maya Codices the vase, cursively drawn as a "horse-shoe" mark, is proved to be intimately connected with the ideas of liquid falling from above, and constituting the drink of divinities and symbols associated with the sacred vase, night and darkness, all attributes of the Below. We shall next demonstrate that it was alternately placed, on the Maya Caban glyph, with a curious sign consisting of a pea-shaped black dot, to which a curved and wavy line is attached. This is always figured as issuing from above the dot, then extending downwards and half around it and terminating in a descending, undulating line.

I submit the following to the consideration of Maya specialists: It seems to me that this sign presents an extremely realistic drawing of the seed of a monocotyledonous plant, such as the maize or Indian corn, in its first stage of germination, when the radicle, having issued from the apex, turns downwards in characteristic fashion and penetrates into the earth. Besides the realism of the native drawing there can be no doubt that the image of a sprouting maize-seed is the most expressive and appropriate accompaniment to the symbol of fertilizing rain, on an earth-symbol, and I am unable to understand how Drs. Cyrus Thomas, Seler, Schellhas and Brinton could have overlooked the realism in this image of a sprouting seed, and concluded that it was a portrayal of "fermented liquor trickling downward," a "nose-ornament," or a "twisted lock of hair," "a cork-screw curl." The latter interpretation was made by Dr. Schellhas because he found the sign in connection with female figures in the Codices, which undoubtedly is a fact of extreme interest, as it furnishes a valuable proof that the Mayas associated the earth with the female principle.

Dr. Schellhas, however, records his observation that the sign caban occurs as a symbol of fruit-bearing earth, in the Codex Troano, as it is figured with leaves of maize (p. 33) or with climbing plants issuing from it and winding themselves around a pole (p. 32). Geheimrath Förstemann connects the day-name caban with "cab" to which Perez, in his dictionary, attaches the meaning of "earth, world and soil" (Die Tages götter der Mayas. Globus, vol. LXXIII, no. 9) and adds that the hieroglyph decidedly designates the earth. At the same time he interprets what I regard as the maize-grain and its radicle, as possibly representing a bird in its flight upwards, and he merely describes the accompanying inverted horse-shoe with dots, without attaching any positive meaning to it. It must be added that Dr. Förstemann himself states that he is not satisfied with his own interpretation of these two symbols, the first of which, the seed and radicle, likewise occurs in the day-sign cib, to which I shall recur.

If any doubt remains as to the signification of the day-sign cab, I think it will be dispelled when it is shown that the name cab, or caban is obviously related to the adjective, adverb and preposition cabal or cablil, which signifies low, below, on the earth, in, beneath and under. The frequent association of the cab glyph with the image of a bee, as in the Codex Troano, is partially explained by the fact that the Maya word for honey is cab, for honey-bee is yikil-cab. It affords at all events, an instance, in Maya hieroglyphic writing, of a method of duplicating the sound of a word analogous to that which I detected in Mexican pictography, and named complementary signs in my communication on the subject, published as an appendix to my essay on Ancient Mexican Shields (Internationales Archiv für Ethnographie, Leyden, 1892). On the other hand the day name and sign cib, on which the sprouting grain is also figured, seems to be related to the verb cibah=to will, to occur, to happen, to take place. The allusion contained in both glyphs is obviously the same and signifies, in the first place, the h

Tired of joy pills? Liquor? The idiot box? Try a fleck from ...

THE HAPPINESS ROCK

By ALBERT TEICHNER

Illustrated by ADRAGNA

[Transcriber's Note: This etext was produced from Amazing Stories January 1964. Extensive research did not uncover any evidence that the U.S. copyright on this publication was renewed.]

It was a particularly good asteroid, a great jagged rock roughly four miles square on one side and two miles at its thickest. Within five minutes of sighting it they knew that its flatter side turned away from the sun more than seven times an Earth day. That meant they should be able to land for mineral specimens and still be off in time to avoid the heating phase for which they were not equipped.

"I'll go out," said Warrant Officer Cramer, a tan-skinned young man who was peering ahead even more earnestly than usual.

"I'm Captain of this tin crate so it's up to me," said Hartley. "Right?"

"Right in a wrong sort of way, _sir_. Just two men on board and you're pulling rank!"

For a moment Hartley looked irritated, then his blue eyes twinkled with laughter. "Give me one reason why I shouldn't."

"I've never been on an asteroid and I've been a little nervous about it. I don't want to keep barrelling around space with that kind of a faze-factor bugging the back of my mind."

The great flat side had just turned into shadow and Hartley started to ease the ship down. He said, suddenly bitter, "With all my experience the only thing the political brass lets me captain is a two-man scouter. Consider my rank unpulled--it's all yours Will."

Cramer gave him an appreciative glance and put on his outside gear.

"Let the Boy Scout have the dirty jobs," Hartley muttered, a nervous sneer twisting one side of his mouth. He idly adjusted for the descent onto the sheared stone face and, once Cramer was in the exit chamber, exchanged a parting wave with him through the quartz window.

Queer duck, saying a thing like that, Cramer thought as he opened the outer hatch. _A little too bitter about things for his own good sometimes._

But then his foot touched solid rock and he was too busy chipping specimens to worry about poor Nick. After each tiny chisel stroke his body bounced slightly away and, gripping the lead rope, he had to retrojet himself back into the circular light patch thrown by Scout III. The stuff was hard composition but, fortunately, with many straight stress lines so pieces slowly did come loose. One carefully placed blow, then a whirl of stars streaming across jet blackness, then a swing back into the light and another blow and another outward swing.

Suddenly a voice crackled in his ear. "You've been out fifty minutes, Will."

"It can't be!"

"Asteroid time's tricky when you're busy. How many chips you have?"

"About a dozen."

"How many do you want? Don't be such a glory boy, get in right now!"

* * * * *

As he pulled himself along the line and up through the hatch he realized that not only had he been undisturbed while on the rock but he hadn't even considered the possibility of becoming frightened! Pleased with himself, he closed the hatch door, raising the current in each magnetic lock to sealing maximum. As soon as the last bolt was sucked into place, his suit started decompressing while chamber pressure mounted in precise compensation. For a second he thought he saw a white speck eddy out of the specimen box attached to his belt but another did not follow. Anyway, suit vizors had a way of clouding up on the inside during chamber compression and that could play funny tricks.

Five minutes later, though, when he pulled off his helmet a little swarm of white specks welled up toward the ceiling. Then they were gone. _Funny_, he laughed to himself. "Funny, funny," he suddenly laughed aloud, "Talcum powder from the void!"

There was Hartley's face at the window, peering anxiously at him, and, for some inexplicable reason, that sight was even funnier. Shaking helplessly, Cramer slapped his knee and kept pointing at the face. _Life is so wonderfully wonderful!_ he said to himself, unable to utter anything aloud now. _Wonderful wonderfully!_

After a while Hartley opened the door to the front cabin and helped him to his cockpit seat. "Sorry, old man," Cramer gasped happily. "Don't know why I did that."

It was surprising how undisturbed by the private joke Hartley looked. He seemed to be too abstracted for that. "Feeling all right?" he finally asked.

"Perfect!" Cramer grinned, greeting the galactic reaches with a wave of his hand. "Isn't it a beautiful universe? I think I could count all the visible light sources out there in ten minutes if I wanted to. No, I don't want to count anything but my blessings, I just want to look."

"Not from here, though. This rock makes its crazy wobble into sunlight soon and I'd rather be off it when the surface starts heating up."

Hartley eased the craft upwards, pulling her back a few dozen miles. Then he balanced the power exhausts into hover and took the specimen box from Cramer's belt. "You've got ecstasy of the space deeps, never can tell when that'll strike a man out there." He studied the little slate-blue chips inside. "You notice that white stuff, Will?"

"First thought it was just vizor clouding." He was thinking with extraordinary clarity even though he still felt wildly elated. "Seemed to happen after the temperature moved above water-freezing."

"Yeah. You did everything by the book, son, except the thing that justified your excursion in the first place. When you came in you merely forgot to seal the specimen box and set its cryogenic cell for deep freeze. Bringing the chips into human temperature range may have destroyed some of the specimen's value. Usually doesn't matter but in this case I wonder--"

"Gosh, that's awful! I'd be glad to go out again."

"No, you may have stupidly done a smart thing. But you'll really boggle it this time with the ecstasy clouding your mind."

"I'm thinking clearly, really I am."

"Can't be."

"Okay," he said, "test me. Give me some digits to multiply while you punch them on the computer."

"All right," Hartley muttered impatiently. "38,373 times 14,621 times 322. Satisfied?"

After a few seconds, "1-8-0-6-5-8-6-2-5-8-2-6."

Hartley pulled a strand of tape from the computer. "Repeat it slowly." Eyes widening, he followed the response on the tape. "You've got it right!"

"Satisfied? Seriously, though, it's nothing when you know the tricks. Old-time non-machine calculating was one of my hobbies when I was a kid."

"It isn't 'nothing.' Space ecstasy ruins a man's ability to think straight for hours. Plenty of bodies are still drifting around space because in the early days they neglected the proper safety checks." He stared through the magnifier at the asteroid, its flat face now glittering in sunlight. "Starting to feel the hangover headache?"

"No, just fine. Nick, I've never felt this good in my life!"

"We'll wait here an hour."

* * * * *

But after the hour was up Cramer was still grinning. "I'm ready to go out again," he said.

Hartley stared at him. "Then it _was_ that white stuff. Man, you've hit on something. There have been a few reports about this kind of untroubled ecstasy reaction but nobody ever spotted that powder. We're going back!"

When the asteroid was back in position again they dropped to the surface. Cramer started up but Hartley held him back in his seat. "This time I do pull rank. I'm going out myself."

Cramer shrugged. "I'm in too good a mood to offer the slightest protest."

"Your mood's why I'm going." He put on his suit and went into the rear chamber. A few minutes later he disappeared outside.

"Everything okay?" Cramer radioed.

"Sure thing. I'll be right back. This stuff flakes off like mica, easy to handle when you know the angles of the fault lines."

A few minutes later he was on board again. "You sure were fast!" Cramer exclaimed.

"Get the comp-decomp going and don't chew so much fat."

"Okay." He activated the self-compensating cycle and watched his superior through the glass. There it was again, a few specks from the specimen box. He, too, had forgotten the standard operating procedure! Then later, as Hartley took off his helmet, a swarm of them ascended like angry midges to the ceiling. In a few seconds the Captain was laughing more relaxedly than Cramer had ever seen him laugh before.

When Hartley came into the cockpit he exclaimed, "Wonderful! There's something like mica in these rocks and the powder's all over in the schists." He went to a corner and pulled some things out of an equipment cabinet but his back blocked Cramer's view. Still facing away, he headed back into the exit chamber. "Go out again," he said.

"But, Captain, you won't know what you're doing!"

Hartley gave an airy wave. "You did, didn't you?"

"Yes but--"

"No buts, my young friend. I'll be on the line. Anything goes wrong, you turn on the winch and I'll be wrenched right back in."

"We'll be orbiting into sunlight and--"

"Forget it, I'll be back on time. There are only two universal laws, son--get happy and stay happy." He shut the door, put on his suit and ordered a compression recycling. As soon as it was completed, he jetted himself through the escape hatch.

* * * * *

Again he was back very quickly but this time, as soon as the helmet came off, he whipped out a specimen slide from an inner pocket, waved it gaily through the talc cloud (_again_, he had left the box unadjusted!) and slipped the slide into a portable pocket microscope. He gripped the scope in his eye like a monocle and stood spellbound for five minutes until with a shout of joy he let the little electronic cylinder drop into his hand. "I'm going back out," he said.

"But, Captain Hartley, you'll get caught on the heating surface."

"Open the cockpit door!" As soon as he came in, he sat down at the controls and lifted the craft off. "See, Cramer, I can think straight, too, under the influence. You were right this time and I've listened."

Then he switched to hover.

"We're not going back _again_, sir, are we?"

"Of course," Hartley grinned. "After all, I made the same mistake you did. Twice I've let the temperature of the specimen box dekelvinise!"

Despite his continuing sense of well-being, Cramer felt uneasy, but there was nothing he could put his finger on so he didn't protest. Anyway, he could see Hartley would not be swayed now from whatever was his strange purpose.

A few hours later they settled back on the asteroid and the Captain went out once more. Cramer tried to watch what he was doing but Hartley was too huddled over the fault he was working for much to be seen. An hour later he came back in, and made some fix notations in his log book as soon as his suit decompressed.

They took off immediately. "This time the box stays locked," he said, pointing at the lid dial which showed the tiny atomic power unit inside was keeping the core's contents at Kelvin 90. Then he radioed the mother ship for a directional beam and locked the craft on automatic pilot. He glanced thoughtfully at his assistant. "When we come in _I'll_ make the report."

"But I know that's standard, Captain, I learned it the first month at the academy."

"Just wanted to make sure you remembered. How do you feel, Will?"

"Perfect."

"No after effects! Same with me!" He thumped Cramer's back in a hail-fellow-well-met spirit and Cramer thought, _Not such a bad guy sometimes_.

* * * * *

But, of course, that little outburst of camaraderie had to stop short as soon as they debarked inside the mother ship. The _Solar Pioneer_ was strictly spit-and-polish, all twelve hundred feet of it, and as they came out of the scout craft hangar, there were brisk salutes to be exchanged and data registration books to countersign. General Chisholm, a natty man with brightly burnished swagger stick to match, was personally on hand to greet them.

"Anything of interest to report, Captain?" he snapped.

"Fairly routine, sir." He gave Cramer a silencing glance.

"That's the trouble, Captain, the whole voyage has been. You're the last craft in so we're heading back to Earth now."

Hartley held out the specimen box. "We spotted a good landing asteroid--one side flat as a mesa. Composition fairly similar to granite and mica."

"Nothing else?"

Cramer started to open his mouth but Hartley broke in; "Nothing, sir," he answered.

"The white stuff, sir," said Cramer, holding chin and stomach in.

The General glared directly at him. "You're out of order, Mister."

"Yessi--"

"Then don't say another word." He pulled out a little black book, made a notation and looked at Hartley as if no one else were there. "What's this about?"

"Nothing important, sir. We didn't have the specimen box set cryogenically a few times and when the temperature went up to human normal in the compression cycle chamber little water crystals flew out."

"Well, nothing unusual about that."

"But, sir," Cramer protested, "they couldn't have been just water."

"Silence!" Chisholm roared and two of his staff officers at the bend of a corridor turned to watch the fun. "Consider yourself under Probationary discipline, Mister Cramer. Informality's natural and permissible on a front-line craft like a scouter but chain of command has to be _absolute_ on a dreadnought, you know that."

"I'm very sorry this happened, sir," Hartley apologized.

"When we land he's under your probationary control for the first five days of Earth leave. It's up to you to teach him how to stay in line." He rubbed his brush mustache thoughtfully. "To begin with, though, it might be good to take him along to Analysis Lab just to show him how wrong he probably is even about the specimens. Any objections to that, Mister?"

"No sir!" he said, more hopeful now of exposing Hartley.

"A very good idea, sir," Hartley nodded unexpectedly.

They proceeded two hundred yards toward the stern where the Specimen Analysis Laboratory was located. In one long room there was a row of totally automatic equipment for both deepfreeze and normal temperature breakdowns. Sommers, the chief chemist, set the specimen box in a large, sealed chamber with one transparent side. When the inside temperature matched that within the box itself fine robot fingers unlocked it, withdrew samples and shifted them toward various test compartments. Meanwhile, Chisholm explained about the crystal cloud to the chemist.

"That must have been an exceptional batch," Sommers said, as he studied the response dial. "_Very_ little moisture here. Nothing important to that one way or the other, though. Matter of fact, nothing important to these specimens in general--usual asteroid run."

Hartley impassively considered the shocked expression on Cramer's face.

"Confined to quarters for the rest of the voyage," snapped the General, turning his back on the miscreant.

* * * * *

As Hartley led his ward to scout quarters, he kept shaking his head. "Shouldn't make trouble like that, Cramer. See where it gets you? I can't get ahead in this man's service so how far do you think _you_ can go?"

"But you didn't tell him the most important thing. And the material in the lab didn't give off _any_ whiteness even when its temperature was raised. I don't think you put in any new chips the third time you went out--I think you're trying to hide something!"

"Sure, right here." He pulled a pocket inside out. A few tobacco shreds were clinging to the lining. "Go ahead, tell them more and you'll keep getting into deeper trouble. Nobody will believe you anyway."

They stopped by the Recreation Room entrance to watch a foursome at ping pong. It was a good game, requiring special skill since the artificial gravity of the dreadnought-class craft varied slightly from that of Earth, "Come along," Hartley said finally, "no human company for you until touchdown. When we're on _terra firma_ I'll show you how silly you've been and you can get in on the ground floor for something really big."

Saying nothing, Cramer stepped into his little windowless cabin and listened as his door was locked from the outside. He broke open an emergency ration bar, munching sullenly until the idea came to him that the asteroid experience had to involve some new kind of drug Hartley wanted to keep to himself. He would have to convince the authorities that the matter warranted further investigation, chain of command rules or no rules.

Meanwhile, there was a week of isolation to be filled. There were thirty courses on his shelf to choose from, various things he had planned to learn when the occasion arose. Now there'd be enough time to absorb two of them. He set up the audio-visuals and started on the intensive twenty-four hour regimen that permitted even sleeping hours to be pedagogically fruitful.

A week later, as the _Solar Pioneer_ settled in its magnetic cradle near Paris, he found himself master of _Old Sanskrit_ (his eighth language) and _Luna: History of the First Settlements_. He also found himself once more face to face with the problem of Hartley's devious scheming. A Probationer's badge was given him to wear before the Captain took him off the ship. Hartley accompanied him in a RobotCab toward the tower city twenty miles down the Seine from the ancient arrondissements.

"That powder was a drug," Cramer said as soon as they were alone in the cab. "You think you can turn it to private advantage but the idea's insane--everybody knows the dangers of drugs."

"That's the beauty of it--it isn't a drug." Hartley leaned back and crossed his legs. "There wasn't any after-effect, was there?"

"Doesn't mean a thing--drugs only do their real damage after repeated dosages. Joy can't be this free--you have to pay for it at horribly compounded interest when it comes this easily."

"I'm willing to wager we're going to find this stuff perfect, no side effects at all and--"

"The cry down through the ages, Captain, all drugs have been evil but this newest one is the exception. Until it turns out to be the same narcotic chimera, pure hell."

[Illustration: "... all drugs have been evil but this newest one is the exception."]

"--and, Mr. Cramer, it isn't a drug."

He threw up his hands. "A chemical working like that one did isn't a drug!"

"Did you ever hear of a narcotic drug that was alive?"

"Alive? Did you say _alive_?"

"That's what I said," he smirked.

"But then--. You mean it's a germ?"

"Ah, getting smart at last!"

"Then we're infected and you want to corrupt other people the same way."

"Nobody can be infected." Eyes glittering, he watched the first vast metropolitan tower grow ahead of them. "The germs die after a few minutes of body warmth--die and _completely_ disintegrate. I saw it through the eye-socket microscope!"

* * * * *

Cramer felt the first cold horror brush his brow like the substanceless touch of the wings of the angel of death, but he managed to stifle his incipient protest. It was more important than ever now that he find out what was being planned. "That _is_ peculiar. I don't know whether it could be called a drug or not."

"It isn't one. But a name's not important one way or the other except sometimes for legal purposes. The important point's that here's something without any bad side effects because the body utterly destroys it." He pulled a cylinder from his pocket. It was the smallest deepfreeze unit generally available. "At least 100 cc in dormant _pure_ form inside this cryogenic package."

"That's what you were doing on the asteroid, gathering your own private stock!"

"Naturally. I saw that the powder lay in the schists and just scraped the stuff in and sealed it up." He patted the insulating ceramic. "Now we're going to see a friend of mine and, if I'm right, we have five millon dollars in the palm of my hand."

"Why are you telling me this?" Cramer demanded.

"Because it's simpler to have you in on it than on the outside. Not that you'll be able to do anything even if you remain so naively Boy Scoutish about it. Who's going to believe your story at this stage of the game? There's an even better reason why you'll keep quiet, though, but I won't tell you that until later."

Cramer was still considering how he might snatch the capsule away when the Captain dropped it back into a self-locking pocket of his suit. The cab had stopped before the sleekest tower on Boulevard Radial. Hartley jumped out, waving for Cramer to follow.

The elevator had several other people in it, all of whom eyed the Probationary badge with distaste. Any attempt to subdue Hartley would receive no support from these super-respectables.

The two of them got off at the eighty-seventh floor and were ushered into a vast, luxuriously-decorated chamber. About a dozen men and women were scattered about the room, boredly watching a color symphony unfold on one wall. They were all dressed in the sort of highest fashion glitter which evoked as much disgust as amusement among most space workers. But Hartley was obviously not typical of his breed; he enjoyed coming among these people, livening up as soon as he saw them.

A tall, blonde man came slowly toward them, wearily rejoicing. "So glad to see you, Hartley. Ah, a Probationary in tow--well, any Probationary is a fellow friend in the kingdom of chaos."

Hartley perfunctorily introduced them, then glanced around. "Drinking nectar?"

"It kills time, can't do any damage and--I know what you're going to say," he grinned, "it's a bore!"

"Well, it is, you should be on to something stronger."

"You gone space gaga?"

"Not at all, Neilson."

"Who would bother with what isn't safe? Everyone knows down to the last nerve tremor the consequences of really good stimulants. We've seen it, smella- and feela-visioned it through social indoctrination procedures to the point where no one would dare. All we can do is stick to the legally permissible alkaloid-heightened caffein derivatives."

"Suppose I told you there is something new, something perfect _and_ safe?"

"I'd say gaga again, sheer lunacy!"

"All right, just listen." He recounted their experiences on the asteroid and, despite himself, Neilson began to show real interest.

"And you have a capsule?"

"Yes, want to try a fleck? That's all you need, I think."

"Oh no!" Neilson exclaimed. "Not until I've run the tests."

"Well, that's what I'm here for. You're a biochemist, you have all the equipment."

* * * * *

Cramer looked disdainfully at the man. The type was common enough--probably knew next to nothing about his specialty. But--and this was what made it doubly revolting--he didn't have to know in order to be an expert. Good equipment could do _all_ the work in most cases.

Neilson waved languidly toward his other guests, mumbling, "See you shortly," and let the pair through a series of golden rooms to his Analyzer Laboratory. There he took the capsule from Hartley and placed it in a cryogenic tester similar to the one aboard the _Solar Pioneer_. After temperature adjustments were made, tiny filament hands began lifting out specimen flecks and shifting them to various test sections.

"Odd stuff," murmured Neilson as he surveyed the preliminary sheet punched out by the reporting machine. "It's a living organism and--and it's _silicon_-based! That's a real weird one. Its biological action in the human body wouldn't be like any narcotic, completely new. Can't read the next stuff--ah, here's the translation--heightened hormone discharges, not one of which is detrimental. Metabolic cycle of bacteria somewhere between three and four hours."

"The spin period for the asteroid! This stuff's likely to be available hundreds of places in the asteroid belt, wherever the spin period's in that range. Might have an endless supply because in its native habitat it reappears after the heating phase even though something in the human body destroys it permanently."

Now summaries were being pumped out more rapidly and Neilson was scanning them with unwonted speed. "Fleck dose too small for _any_ endocrine upset. None for musculature either. Gastro-intestinal negative. Bone Marrow negative. Ten minutes after entering the body this stuff dissolves completely into _lower_ elements! Physiologically non-habit-forming. Hartley, if this gives all the pleasure you claim it's the answer to our wildest prayers. I will try a fleck."

As soon as he inhaled the infinitesimal dosage he began grinning at the pair in speechless wonder. Hartley joined him and offered to set a bit up for Cramer.

"No," Cramer said, "I don't care what the analyzers say. You can't get something for nothing."

"This is beyond price," Neilson sighed contentedly. He moved to a wall mirror. "Not even a little retinal contraction. The dosage is so small the silicon base couldn't hurt you even if you took one an hour for the rest of your life. And there can't be any hangover."

"No law on the books against it and I don't think the public would tolerate a prohibition. This stuff is actually _good_ for you!" Hartley exulted.

"And we are the only ones on Earth who have it for at least the next few weeks!" He jotted down some calculations. "Figure a hundred thousand doses in the capsule and at least fifty dollars a microscopic flake slice, seventy-five dollars, more probably. Anybody can lay his hands on cryogenic capsules--they're all over the place. We'd only need a few dozen runners and I can get them easily enough. Are we in business, Hartley?"

"Let's give a free sample to your friends first."

"Fair enough, they're going to be among our best customers."

Cramer watched in horrified disgust as the others were summoned and willingly passed over into the fully-conscious ecstasy. But why the horror? Why the disgust? he demanded of himself. Why condemn something that even the Specimen Analyzer showed to be wholly beneficial? He couldn't find the tangible reason but that didn't matter; there had to be something wrong somewhere.

"Still not with it?" Hartley asked after a while.

"I'd just as soon not bother quite yet."

"Well, you do know what you're missing," shrugged the Captain. "My Probationary rights don't give the privilege to insist on this. As I told you, complaining to authority wouldn't change anything but now I'll give you the biggest reason why. Even in the highly unlikely case of their believing your story, they couldn't move against me because they'd know it wouldn't matter. First I'd see to it that word got out about germ-joy. There are hundreds of craft on the Mars run that can detour into the asteroid belt and pick up a supply once they know what to look for. Look at all the freighters that do a little bootlegging on the side now--there'd be no way to seal off that supply."

"I can see that," Cramer agreed. "I'm not interested in reforming anything. I just don't want to be personally involved."

"Perfectly all right," Hartley said thoughtfully. "Each man to his own tastes." Then he moved away to discuss business arrangements with his host.

How do I get out of here? Cramer wondered. _And how do I get anybody to listen, to believe such a wild story from a Probationary? Or would it be best to string along with them and see what happens?_

* * * * *

Trying all the while to hide his anxiety, he struggled with a dozen problems that seemed to have no solution, that might not even deserve a solution if the stuff were as harmless as it had shown itself to be so far. For the present, he had to appear to be one of them; just before going in to dinner, he asked for a fleck and there was a patter of applause from everyone with jovial cries of "For he's a jolly good fellow!" and "Now you're talking!"

There was no denying the renewed sense of youthful cleanliness it gave him, as if every nerve of his body had been gently washed down to dawn of life freshness.

The main course consisted of yeast snow nectar laced with rare confectionery spices that broke evanescently on the palate and then subtly vanished to make way for the next clearly distinct sensation. Behind his own mask of laughter Cramer drowsily watched all the other chattering faces. After a while there only seemed to be the glitter of eyeballs and silver and perfectly-spaced teeth sinking into nectar, and he got up with the assistance of Hartley and Neilson to accompany them sleepily, oh so yawn-sleepily! away to another room....

He saw himself floating from afar toward the asteroid, its rougher side glowing in the sun, the flatter one a sable blank. He moved slowly through a viscous atmosphere, one joint stickily shifting after the other. An enormous flake of whiteness settled on his face and he inhaled. To be _this_ happy, _this_ content! And again the movement around the surface as gradual as the turning of the asteroid itself. Over and over again, never an end to it, while another flake drifted inexorably toward his upturned face. And again that final happiness.

He swung imperceptibly, across the surface of his new home as it streamed in an arcing line along the invisible orbit of the asteroid belt. And always at the right interval another floating flake.

When the voices came to him they were hardly wanted and totally unneeded but, although he did not listen, he heard them and even identified their owners.

"He's hooked now," Hartley was saying.

"I guess so," Neilson answered. "But it's not physiological."

"Who cares about that? _Psychologically_ he's going to want the stuff from now on--any sensible person would. You know, we're actually doing him a favor, destroying his inhibitions against something so harmless."

"Which doesn't concern me one way or the other."

"Well, maybe it would have been neater just to get rid of him but Probationers have to report to HQ at the end of their punishment periods. If he doesn't go in today there'll be an investigation and, believe me, Neilson, they'd trace down my every movement and get an electronic hold on me that I couldn't shake. The whole thing would come out."

"A lot of good spilling our beans would do the government. Someone else would just bring in the happy germs."

"Yeah, but this next month's the time when _we_ make our killing. Hey, I think he's starting to wake up."

"No, prob--"

Neilson's answer mumbled itself away and he found himself floating across the flat face of the asteroid, waiting for the next huge flake to descend.

... And then he was really awake. He discovered that he was leaning against the back of a heavily-padded chair, alone in a guest bedroom. Approaching footsteps told him the pair was returning and he hastily shut his eyes. This had to be carefully managed.

"Ought to be waking up about now," said Neilson.

Cramer started stretching, then rubbed his lids and blinked at the light. "Give me a fleck," he pleaded. "Just a little bit."

The two of them nodded to one another and Hartley leaned forward. "Takes a little while to get it out of the freezer, Will."

"I want it now," he said petulantly.

Hartley gave his shoulder a comradely squeeze. "One of the gang now, eh? Come along and you'll get it. You have to report to HQ."

"I have five days Probationary." He got up and followed them a little unsteadily to the cryogenic freezer in another room.

"Five days are up," Hartley explained. "You've been doing a lot of sleeping, even were sleepy when you got up to eat."

"Don't understand."

"I'll tell you after you get our sniff."

"Yes, that's what I want now."

* * * * *

One tiny fleck came out on a holder the size of a fingernail paring. It was frightening how quickly they had developed techniques for handling the stuff.

"Take it fast!" Neilson shouted. "That germ colony's worth eighty dollars and it's breaking down fast. You won't get another."

Cramer leaned forward to quickly breath it in. By the time he exhaled it was already working its magic. He straightened up and smiled with hangdog gratitude. "Oh, that's good!"

"Had to get you used to it," Hartley said. "Only reason why we kept you sleepy--you'll thank us some day."

"Some day? I thank you _now_!"

Neilson gave him a friendly handshake but his eyes were coolly observant. "Okay," he nodded for Hartley's benefit.

Hartley glanced at his watch. "The stuff's all gone by now. They can't find a thing even if they do give you a checkup."

"But the silicon--"

"Not a trace," Neilson said. "This thing even breaks up on the atomic level, takes a little longer than the germ death but inside an hour no silicon."

"But the fission breakdown--"

"Don't ask me," Neilson shrugged, "it doesn't work that way. Must have something to do with the beautiful energy charge you get from germ-joy."

"Feeling clear-headed?" Hartley asked.

"Sure, I'll be right back for some more after I report."

He went out, grinning inwardly. They were right about one thing--it wasn't physiologically habit-forming. And he just did not have the kind of psychological defect for it to be habit-forming any other way.

When he reached Space Pioneer HQ he handed in his card at the Probationary desk. The Major in charge looked him up and down in stony silence, then suddenly barked, "Anything to say, Mister?"

"Yes sir. I want to register a complaint with General Chisholm personally."

"What!" His face turned beet red. "Look, soldier, we're not strictly GI in this outfit out of love of red tape. This is a dangerous service. You have to follow the chain of command every time." He entered a black mark on the card. "Tell your immediate superior."

"He's the one I'm complaining against, sir."

"Then go see the Inspector General!"

"The time lag, sir, it would take too long to reach General Chisholm."

The Major violently punched another mark on the card. "Wipe the grin off your face, Mister. What's so funny?"

"That's part of my complaint, sir. I've been drugged to joy."

"I really ought to call the General. You'd make a perfect punishment example."

"Just as long as I get to talk to the General, sir," he said, confidence in his success gone even if the evil stuff kept him feeling so good.

"Wait in the outside room." He reached for a phone. "Who's your immediate superior?"

"Scout Captain Hartley, sir." He went out and sat down on the edge of a chair. No, it wasn't going to work, he could just see it wasn't.

Then the Major was striding out and shouting, "Follow me, the General actually wants to break you in person!"

Cramer sighed and followed him up an escalator, then past two receptionists and two private secretaries. The Major pointed at a small door. "You go in on your own, soldier."

* * * * *

He turned the knob and stepped nervously into a room which was bare except for a glass-topped desk behind which General Chisholm was seated and a few wrought-iron chairs facing the desk. The General stared at him as if he weren't there but would materialize under prolonged scrutiny. "Sit down and tell me what this is all about," Chisholm said, raising one index finger from the desk.

Cramer sucked in his breath and the story came pouring out, faster and faster all the time as if he were racing against the moment when Chisholm would bark for silence and bring him crashing down. But the General said nothing, studying first one cuticle, then the speaker's face, then back to the next cuticle.

Suddenly he slammed on an intercom and said, "Get Dr. Jonas and tell him to bring a portable blood test rig."

"Then you _believe_ me, sir?" Cramer was too stunned to remain safely silent.

"Of course I don't, Mister, but there's too much smoke for no fire."

"The silicon trace may not show up now--"

A smile flashed up Chisholm's face, then disappeared. "Those are the chances you take when you tell sensational stories."

Cramer's heart sank once more. "Yes, sir."

The specialist arrived with his test machine rolling behind him like an obedient, lumbering mastiff. When he reached the center of the room he turned a dial on his signet ring and the machine stopped.

"This young warrant officer has given me an interesting account of his recent experiences which, he would have us believe, included being drugged into sleep and semi-sleep," said Chisholm. "I want you to test blood samples for silicon traces, in fact the whole gamut of tests."

Dr. Jonas' pointed chin sank toward his chest, then rose. "Yes, General Chisholm." He pulled up Cramer's left sleeve and applied a blood-sucker tube which clicked off drops until it reached fifty and stopped. The doctor set the fractionating apparatus on automatic and approached his superior's chair to say, "I hardly think a person could be sedated with a silicon compound, sir."

Chisholm gestured for Cramer to remain silent. "All right, while we're waiting for your machine to complete its run, here's a purely hypothetical problem. Imagine a silicon-based _bacteria_--"

"_What?_" Dr. Jonas exclaimed.

"I said a silicon-based bacteria. It raises human metabolism when absorbed into the blood stream in the form of a tiny frost flake, a flake whose very _atomic_ structure breaks down the elements scale without the explosive force of nuclear fission or any other kind of serious disruption."

"I'd say the whole thing's impossible, sir!"

"But let's just suppose it is not."

"Then I'd have to proceed on the assumption that the life cycle of the hypothetical form permits it to reach a high threshold of energy storage, part of which energy is smoothly released while the rest achieves a new balance as the silicon transmutes into elements of lesser weight."

"Sounds like a reasonable explanation for something unreasonable, doctor," he stiffly observed. "Your tests should be ready now."

* * * * *

Dr. Jonas looked satisfied as he pulled the tape from the machine. "No silicon." He stopped, frowning. "But there is indication of massive barbiturate dosages. This man _has_ been drugged! There shouldn't be any lasting damage--he's a healthy specimen all right--but whoever did this wasn't worrying about his welfare, General."

"Thank you, Dr. Jonas, you may go now." He casually leaned back in his chair. "This is Top Secret for the present. I will be consulting you later on this matter."

"Yes, sir."

But as soon as Jonas and his equipment were gone the General sprang into frantic action. "You're under arrest, Mister."

"Sir!"

"_Protective_ arrest--although it won't be announced that way. No time for explanations right now. Give me the precise reading and time for that asteroid."

When he had the information he activated a keyboard at one side of his desk which fed the orrery computer several miles away. A few seconds after he punched in the data, the reply came back with the exact present location of the asteroid. He immediately threw a switch which lowered the lights and simultaneously splashed a map of the solar system on all of one blank wall. The map carried the caption _Pioneer Logistic_ and showed a dozen labelled points scattered throughout the system's inner and median reaches. A few were moving very slowly while others appeared to be at rest.

After a minute's careful scrutiny the General leaped to his feet, muttering, "Good, good, Hazelton can get there in four hours." Starting his sender, he brought on Message Center and commanded: "Get me Admiral Hazelton on the _Star-Seeker_. Top Priority Instant Action Field Officer Line."

Cramer, accustomed to slower transmission channels, was startled by the speed with which Hazelton's voice came into the room. "Standing by, General."

"Admiral, have your daily code book handy?"

"Right here."

"Put her on today's complete garble in precisely ten seconds." He set his own coder and waited. "Okay. Hazelton, are you receiving me clearly?"

"Perfectly, Chisholm."

"All right, now nobody else can follow what I'm going to tell you. Immediately shift course for 325.83.21 in asteroid quadrant, subsection 38." A protesting squawk came hurtling across space. "First give your people my orders, then I'm going to tell you why."

Cramer gaped as he heard his superior start to repeat his story. The General _must_ have believed it!

Ten minutes later Hazelton broke in with a final "Oh, my God!" For a while only his heavy breathing could be heard, then he said, "Chisholm, if there's anything to this it's the worst social catastrophe of the century!"

"I know it. Contact me as soon as you have a sample analyzed. You should be able to manage in six hours or so--this line'll be open at all times from now on. Off."

Chisholm came back to the desk and looked steadily at Cramer. "You sure have me going far out on a prestige limb."

"I never expected anybody to believe me, sir," he replied, all gratitude.

"I still don't but we can't take any chances. I know something has to be going on. You see, Captain Hartley resigned from the service yesterday."

"But he's still under your command for three months, isn't he?"

"No, he's a free agent. He entered a Categorical Resignation. That means he's giving up all benefits accruing to a man of 25 years standing but his resignation is immediately effective."

"You could still arrange for his arrest through the civil channels."

"I doubt whether any continental president would care for that idea, I know I don't. Your former Captain's a very shrewd man, he knew we'd see how helpless we are--I only hope that you're lying through your teeth!"

"If I don't return soon, General Chisholm, he'll suspect something."

"Again, it doesn't matter very much." He sat down and rubbed his chin. "If we let you go back, do you think he'd let you see how they're organizing their operation? True, it would be more convenient for him if, for a few more days, we wouldn't be investigating

him--that's why he took the chance of letting you report back here and avoided the Probationary hunt. To his way of thinking, chances are that you'll want further dosages and keep quiet. But why should we expose you further to that stuff when the possible sacrifice involved won't give us any more information?"

"Then you're just going to surrender the point, let him realize you know and won't do anything about it?"

"Not exactly. The best we can do is keep him uncertain about you. Officially, you've been arrested for insubordinate behavior by a martinet General who's decided to make a horrible example of you. Someone looking like you is going to be seen entering a punishment craft heading for a monotony run to check the automatic satellites around Uranus. That's the stupid best we can do--we're over a barrel." His sharp eyes suddenly dug into Cramer's. "You'll be in isolation quarters for the next few hours. I only hope that you'll deserve to stay there, that your story is all malicious nonsense!"

* * * * *

Cramer was escorted to a small cell where there were no audio-visuals, only old-fashioned printed books. He picked up a few of them, stared at the title pages without knowing what he was reading, then began to pace his cell.

What if they didn't find a germ sample? After all, nobody had ever spotted the stuff before.

No, they knew what to look for now and that made a difference.

But maybe it didn't in this case.

And what made them feel so helpless? What gave Hartley that much of an advantage over a General of the Space Deeps?

Nothing added up and it seemed he had been shuffling the crazy pieces for a week when they came to take him back to Chisholm's office. The clock, though, told him only eight hours had passed.

Another man was in Chisholm's office now and he recognized him as soon as he came in--Shelby Johnson, President of North America. The newcomer nodded grimly as they were introduced to each other.

"President Johnson is here incognito, came by a private entrance," Chisholm explained. "You're not to mention this anywhere."

"A real mess!" Johnson exclaimed. "But at least there was someone decent enough to give us forewarning. This stuff's supposed to be so effective, no hangover, no known damage to the system--why didn't you go along with Hartley's reasoning?"

"There has to be some bad long-range effect, nothing comes that cheap."

"I only hope you're right." Johnson's grey eyes seemed to be focussed far off. "Otherwise the social damage will be terrible."

"_Everything_ you told me has been confirmed," said Chisholm. "Scouts had no trouble finding a batch and the tests confirm that it's seemingly harmless, breaks down completely."

"Then why don't you arrest Hartley?"

"That would just spread knowledge of this even faster. He's probably seen to it that will happen and can hold it over our heads."

"Counter the thing with a propaganda offensive, highlighting the evils."

"What evils? Young man," the President broke in, "Who's going to be scared off from something that sounds so harmless? Two things are working against us--the supply's easily replenishable _and_ testing equipment's much too common for us to put over any white lies."

"Still hard for you to understand, isn't it?" Chisholm sighed. "Cramer, a terribly big percentage of the population has become passive and bored, just looking for some easy diversion. We have all we can do just to keep this social cancer from spreading without germ-joy. _With_ it, matters can get out of hand. And I don't care how automated and wealthy a society is it can't get by if we develop _that_ big a burden of non-thinking freeloaders."

"General Chisholm isn't wholeheartedly with the plan I've adopted but--"

"But I haven't a thing better to suggest, Mr. President," the General conceded.

"Who does? Well, the plan for the next few weeks is this, to keep very close surveillance of Hartley's activities without openly conceding we know what he's up to. We have to hope that some defect will show up in a user even though the first report says no one sees how it can happen."

Cramer protested. "You're going to let him get away with it!"

"For the present," President Johnson nodded. "We're not interested in punishing a particular man. We have to give him all the joy-rope he needs and hope that he, as the longest-run user, suffers the consequences."

"I could keep taking it myself if you need a guinea pig."

"The rasher section of the public will supply enough guinea pigs," said the General. "You'll stay here at HQ, looking over all the reports that come in, Mr. Cramer, maybe your experience will help somewhere along the line. If, after a few weeks, nothing shows up, we will crack down on Hartley anyway."

"Not that it will do much good," said the President. "But we, too, need our moments of purely personal satisfaction."

* * * * *

The following day Cramer was given a robot-run suite high in HQ Tower. His human contacts were restricted to a few total security clears who occasionally brought him messages too delicate for transmission on the building's internal net. Inured to the isolation-training of the spacenaut, he was not disturbed by the lack of company.

But within two days a message arrived that did disturb him. The _Star-Seeker_, returning with its precious capsules of asteroid bacteria, was still a week from Earth base and already one scout who had somehow sampled germ-joy was under forcible restraint for trying to get additional dosages. Medical analysis showed no physiological addiction but it did indicate some purely psychological craving triggered by merely one dose. The scout was not moved by the warnings of the frost flake's possible danger since there was no binding proof of it.

Chisholm had scribbled across the bottom of the document: 'This is likely to become the classic form of our difficulty, the refusal to see horror unless it can be shown. And here again it's happening to a Space Service man!'

Cramer shuddered at that. The Service contained the cream of Earth's manpower. If germ-joy could bring out their psychological weaknesses, how much worse the effect was bound to be among the listless, bored masses!

As the days went by there were occasional reports on Hartley's activities. With Neilson's help his agents had smoothly eased into many sectors of the scientific underground and huge quantities of money were moving up through the distribution hierarchy. There were even spy reels for him to run off on his projector, reels which showed the ex-Captain looking fantastically youthful and self-satisfied.

Once in a while the bitterly ironic thought came to Cramer that maybe Hartley was inadvertently on the right side. Suppose, just suppose that germ-joy was actually _good_ for humanity! More than ever he longed for some evil effect to become manifest even if it meant he, himself, should be stricken by it.

Eventually he was summoned to Chisholm's office where several scientists were gathered. The feed lines for a Medical Computer had been set up there and he was put through another rigorous checkup. At the end of a half-hour Dr. Jonas threw up his hands and said, "You're in perfect health. Still no after effects--I don't think there'll ever be any. How could there be?"

Chisholm considered Cramer almost resentfully. "You're too damned healthy for our own good! Dr. Phillips here has equally bad news--he's a biophysicist."

Phillips, a skinny, dark-haired man, tried to smile through his look of bewilderment. "We've absolutely run through the testing gamut on the stuff _Star-Seeker_ brought back. Ultra-high microscopy shows no RNA or DNA in our frozen samples, in fact nothing to carry the genetic pattern--yet we know it's alive! We've no way of coping with something so radically different, something that breaks all the way down the atomic scale so peacefully. It can only be controlled by some _sub_-atomic patterns unknown to us."

"There's no way to probe it sub-atomically?" asked Cramer.

"Not at this fine a level. What methods we have show nothing exceptional there after the silicon breaks down." He frowned in a dreamy sort of way. "A lot of the tiniest subatomic bits are still a total mystery, too small for our analytic tools to grapple with. If this stuff would reappear in some analyzable form now we could learn an awful lot about those unknown interactions. Fat chance of that, though!"

"We'll wait another week," said Chisholm, "then, if nothing's happened, we'll pull Hartley and his crew in and hope the public won't end up in his corner. There are probably several thousand regular users already. We already have a few _scientists_ saying the stuff's all right, that we should _encourage_ its use!"

"Idiocy," observed Phillips sadly, "is no respecter of high IQ's."

* * * * *

The week went by more and more slowly in Cramer's tower suite and all the reports only confirmed the General's forebodings about the spread of germ-joy's appeal. Someone else had somehow brought in a batch and was distributing it through a new, completely independent set-up. And everywhere there were vague rumors of a beneficial substance that 'they', the eternally conspiratorial 'they' of undefinable higher authority, were keeping from popular use.

Then, on the seventh day, Cramer had the rash.

It encircled only the wrist of his left hand but the red splotches itched so violently that he immediately called in the medical team. By the time the doctors arrived it was already subsiding. A sample from the splotch area, though, showed a significant trace of silicon but none of the bacteria.

"Somehow the element reformed!" Phillips exclaimed. "We're approaching the breakthrough!"

Cramer watched the splotches shrink into themselves, fearfully wondering what the next phase would be. But, an hour later, this turned out to be bitterly anti-climactic for the assembled group. A urinalysis showed that his body had thrown off an amount of silicon roughly equivalent to the amount he must have taken in through the flakes.

"Looks like you've passed through your crisis," Jonas said. "You're in perfect shape again."

The scientists all looked crushed but their mood changed to annoyance when they saw Cramer's enthusiastic grin. "Don't you see?" he said. "If this happened to me, it should be happening to Hartley too. He got his first sniff only a little while after I did, so the incubation period's the same for him!"

"Unless the large amount he's taken in since then actually confers immunity," Phillips muttered.

Cramer's face fell but he persisted. "We have to find out one way or the other, don't we?"

"No doubt about that!" Phillips called Chisholm's office and explained what had happened.

"Then the operation's on," the General told him, happy to be acting at last. "Hartley's at Neilson's place and we have to get him. Bring along all the test equipment you'll need."

* * * * *

When they broke into the vast penthouse apartment they found nobody around. As they went through one empty chamber after another, they became increasingly nervous. "The building's been thoroughly staked out," Chisholm fumed. "We know he hasn't left this floor."

Then, in the last chamber, they found him. He was lying on a silken couch, breathing heavily, and when they came closer they saw that all visible parts of his body were covered with angry splotches.

"Get the cameras going," barked the General.

"No, do something for me," Hartley gasped, staring in horror at his hands as if waiting for something to appear there. "All ran away, all of them."

As they watched, the splotches on the back of each hand exploded into running sores. While an assistant took a sample from one of the evil, flowering things, Jonas held an anaesthetic bottle to the sinking man's nostrils. But it had no effect and he only groaned the louder, demanding surcease.

More sores opened up on the neck while most of the team frenziedly attended to the Analyzer. One of them came up to the foot of the couch where Cramer was standing with Chisholm and Jonas and whispered to them: "Now it's a silicon _virus_ and it's inducing massive flash-cancers!"

Phillips was too absorbed in some abstruse calculation to look toward the couch any more. "What a breakthrough!" he suddenly exclaimed. "We'll be able to extrapolate the interactions now!"

"Any danger of catching anything from him?" Chisholm asked, looking at the pullulating mass.

Jonas glanced at a report tape that had been handed to him. "No, you don't pick up carcinomas that way. And we know from Cramer's experience today that the victim only erupts into this when a certain critical intake has been exceeded."

There was one final gasp and Hartley lie dead, his mouth the only remaining recognizable feature. Chisholm steeled himself to look at the human wreckage with the objectivity of the nearby camera. "Horrible, but it would have been worse if it hadn't happened, if we didn't have this proof. A different kind of horror, social and slow, but even worse. This way only a few die, not the race."

Cramer heard the General pick up a phone and ask for President Johnson, and all about him there was the clamor of excited researchers getting on with their jobs. But he could not turn away from the ugly spectacle of this death quite yet, nor could he feel any exultation before it even though he knew this outcome was the most desirable of all available possibilities. When you had sailed across the farther deeps with one comrade you had to remember him for whatever had been best in him, not worst.

THE END

MODERN COOKERY

FOR PRIVATE FAMILIES

BY ELIZA ACTON

NEW EDITION

LONDON LONGMANS, GREEN, READER, AND DYER 1882.

PREFACE.

It cannot be denied that an improved system of practical domestic cookery, and a better knowledge of its first principles, are still much needed in this country; where, from ignorance, or from mismanagement in their preparation, the daily waste of excellent provisions almost exceeds belief. This waste is in itself a very serious evil where so large a portion of the community often procure—as they do in England—with painful difficulty, and with the heaviest labour, even sufficient bread to sustain existence; but the amount of _positive disease_ which is caused amongst us by improper food, or by food rendered unwholesome by a bad mode of cooking it, seems a greater evil still. The influence of diet upon health is indeed a subject of far deeper importance than it would usually appear to be considered, if we may judge by the profound indifference with which it is commonly treated. It has occupied, it is true, the earnest attention of many eminent men of science, several of whom have recently investigated it with the most patient and laborious research, the results of which they have made known to the world in their writings, accompanied, in some instances, by information of the highest value as to the most profitable and nutritious modes of preparing various kinds of viands. In arranging the present enlarged edition of this volume for publication, I have gladly taken advantage of such of their instructions (those of Baron Liebig especially) as have seemed to me adapted to its character, and likely to increase its real utility. These, I feel assured, if carefully followed out, will much assist our progress in culinary art, and diminish the unnecessary degree of expenditure which has hitherto attended its operations; for it may safely be averred that good cookery is the best and truest economy, turning to full account every wholesome article of food, and converting into palatable meals, what the ignorant either render uneatable, or throw away in disdain. It is a popular error to imagine that what is called good cookery is adapted only to the establishments of the wealthy, and that it is beyond the reach of those who are not affluent. On the contrary, it matters comparatively little whether some few dishes, amidst an abundant variety, be prepared in their perfection or not; but it is of the utmost consequence that the food which is served at the more simply supplied tables of the middle classes should all be well and skilfully prepared, particularly as it is from these classes that the men principally emanate to whose indefatigable industry, high intelligence, and active genius, we are mainly indebted for our advancement in science, in art, in literature, and in general civilisation.

When both the mind and body are exhausted by the toils of the day, heavy or unsuitable food, so far from recruiting their enfeebled powers, prostrates their energies more completely, and acts in every way injuriously upon the system; and it is no exaggeration to add, that many a valuable life has been shortened by disregard of this fact, or by the impossibility of obtaining such diet as nature imperatively required. It may be urged, that I speak of rare and extreme cases; but indeed it is not so; and the impression produced on me by the discomfort and the suffering which have fallen under my own observation, has rendered me extremely anxious to aid in discovering an efficient remedy for them. With this object always in view, I have zealously endeavoured to ascertain, and to place clearly before my readers, the most rational and healthful methods of preparing those simple and essential kinds of nourishment

which form the staple of our common daily fare; and have occupied myself but little with the elegant superfluities or luxurious novelties with which I might perhaps more attractively, though not more usefully, have filled my pages. Should some persons feel disappointed at the plan I have pursued, and regret the omissions which they may discover, I would remind them, that the fashionable dishes of the day may at all times be procured from an able confectioner; and that part of the space which I might have allotted to them is, I hope and believe, better occupied by the subjects, homely as they are, to which I have devoted it—that is to say, to ample directions for dressing vegetables, and for making what cannot be purchased in this country—unadulterated bread of the most undeniably wholesome quality; and those refreshing and finely-flavoured varieties of preserved fruit which are so conducive to health when judiciously taken, and for which in illness there is often such a vain and feverish craving when no household stores of them can be commanded.[1]

Footnote 1:

Many of those made up for sale are absolutely dangerous eating; those which are not adulterated are generally so oversweetened as to be distasteful to invalids.

Merely to please the eye by such fanciful and elaborate decorations as distinguish many modern dinners, or to flatter the palate by the production of new and enticing dainties, ought not to be the _principal_ aim, at least, of any work on cookery. “Eat,—_to live_” should be the motto, by the spirit of which all writers upon it should be guided. I must here obtrude a few words of personal interest to myself. At the risk of appearing extremely egotistic, I have appended “_Author’s Receipt_” and “_Author’s Original Receipt_” to many of the contents of the following pages; but I have done it solely in self-defence, in consequence of the unscrupulous manner in which large portions of my volume have been appropriated by contemporary authors, without the slightest acknowledgment of the source from which they have been derived. I have allowed this unfairness, and much beside, to pass entirely unnoticed until now; but I am suffering at present too severe a penalty for the over-exertion entailed on me by the plan which I adopted for the work, longer to see with perfect composure strangers coolly taking the credit and the profits of my toil. The subjoined passage from the preface of my first edition will explain in what this toil—so completely at variance with all the previous habits of my life, and, therefore, so injurious in its effects—consisted; and prevent the necessity of recapitulating here, in another form, what I have already stated in it. “Amongst the large number of works on cookery which we have carefully perused, we have never yet met with one which appeared to us either quite intended for, or entirely suited to the need of the totally inexperienced! none, in fact, which contained the first rudiments of the art, with directions so practical, clear, and simple, as to be at once understood, and easily followed, by those who had no previous knowledge of the subject. This deficiency, we have endeavoured in the present volume to supply, by such thoroughly explicit and minute instructions as may, we trust, be readily comprehended and carried out by any class of learners; our receipts, moreover, with a few trifling exceptions which are scrupulously specified, are confined to such as may be _perfectly depended on_, from having been proved beneath our own roof and under our own personal inspection. We have trusted nothing to others; but having desired sincerely to render the work one of general usefulness, we have spared neither cost nor labour to make it so, as the very plan on which it has been written must of itself, we think, evidently prove. It contains some novel features, calculated, we hope, not only to facilitate the labours of the kitchen, but to be of service likewise to those by whom they are directed. The principal of these is the summary appended to the receipts, of the different ingredients which they contain, with the exact proportion of each, and the precise time required to dress the whole. This shows at a glance what articles have to be prepared beforehand, and the hour at which they must be ready; while it affords great facility as well, for an estimate of the expense attending them. The additional space occupied by this closeness of detail has necessarily prevented the admission of so great a variety of receipts as the book might otherwise have comprised; but a limited number, thus completely explained, may perhaps be more acceptable to the reader than a larger mass of materials vaguely given.

“Our directions for boning poultry, game, &c., are also, we venture to say, entirely new, no author that is known to us having hitherto afforded the slightest information on the subject; but while we have done our utmost to simplify and to render intelligible this, and several other processes not generally well understood by ordinary cooks, our first and best attention has been bestowed on those articles of food of which the consumption is the most general, and which are therefore of the greatest consequence; and on what are usually termed plain English dishes. With these we have intermingled many others which we know to be excellent of their kind, and which now so far belong to our national cookery, as to be met with commonly at all refined modern tables.”

Since this extract was written, a rather formidable array of works on the same subject has issued from the press, part of them from the pens of celebrated professional gastronomers; others are constantly appearing; yet we make, nevertheless, but slight perceptible progress in this branch of our domestic economy. Still, in our cottages, as well as in homes of a better order, goes on the “waste” of which I have already spoken. It is not, in fact, cookery-books that we need half so much as cooks really trained to a

knowledge of their duties, and suited, by their acquirements, to families of different grades. At present, those who thoroughly understand their business are so few in number, that they can always command wages which place their services beyond the reach of persons of moderate fortune. Why should not _all_ classes participate in the benefit to be derived from nourishment calculated to sustain healthfully the powers of life? And why should the English, as a people, remain more ignorant than their continental neighbours of so simple a matter as that of preparing it for themselves? Without adopting blindly foreign modes in anything merely because they _are_ foreign, surely we should be wise to learn from other nations, who excel us in aught good or useful, all that we can which may tend to remedy our own defects; and the great frugality, combined with almost universal culinary skill, or culinary knowledge, at the least—which prevails amongst many of them—is well worthy of our imitation. Suggestions of this nature are not, however, sufficient for our purpose. Something definite, practical, and easy of application, must open the way to our general improvement. Efforts in the right direction are already being made, I am told, by the establishment of well-conducted schools for the early and efficient training of our female domestic servants. These will materially assist our progress; and if experienced cooks will put aside the jealous spirit of exclusiveness by which they are too often actuated, and will impart freely the knowledge they have acquired, they also may be infinitely helpful to us, and have a claim upon our gratitude which ought to afford them purer satisfaction than the sole possession of any secrets—genuine or imaginary—connected with their craft.

The limits of a slight preface do not permit me to pursue this or any other topic at much length, and I must in consequence leave my deficiencies to be supplied by some of the thoughtful, and, in every way, more competent writers, who, happily for us, abound at the present day; and make here my adieu to the reader.

ELIZA ACTON

London, May, 1855.

VOCABULARY OF TERMS,

PRINCIPALLY FRENCH, USED IN MODERN COOKERY.

Aspic—fine transparent savoury jelly, in which cold game, poultry, fish, &c., are moulded; and which serves also to decorate or garnish them.

Assiette Volante—a dish which is handed round the table without ever being placed upon it. Small _fondus_ in paper cases are often served thus; and various other preparations, which require to be eaten very hot.

Blanquette—a kind of fricassee.

Boudin—a somewhat expensive dish, formed of the French forcemeat called _quenelles_, composed either of game, poultry, butcher's meat, or fish, moulded frequently into the form of a _rouleau_, and gently poached until it is firm; then sometimes broiled or fried, but as frequently served plain.

Bouilli—boiled beef, or other meat, beef being more generally understood by the term.

Bouillie—a sort of hasty pudding.

Bouillon—broth.

Casserole—a stewpan; and the name also given to a rice-crust, when moulded in the form of a pie, then baked and filled with a mince or _purée_ of game, or with a _blanquette_ of white meat.

Court Bouillon—a preparation of vegetables and wine, in which (in expensive cookery) fish is boiled.

Consommé—very strong rich stock or gravy.

Croustade—a case or crust formed of bread, in which minces, _purées_ of game, and other preparations are served.

Crouton—a sippet of bread.

Entrée—a first-course side or corner dish.[2]

Footnote 2:

Neither the roasts nor the removes come under the denomination of _entrées_; and the same remark applies equally to the _entremets_ in the second course. Large standing dishes at the sides, such as raised pies, _timbales_, &c., served usually in grand repasts, are called _flanks_; but in an ordinary service all the intermediate dishes between the joints and roasts are distinguished by the name of _entrées_, or _entremets_.

Entremets—a second-course side or corner dish.

Espagnole, or Spanish sauce—a brown gravy of high savour.

Farce—forcemeat.

Fondu—a cheese _soufflé_.

Gâteau—a cake, also a pudding, as _Gâteau de Riz_; sometimes also a kind of tart, as _Gâteau de Pithiviers_.

Hors d'œuvres—small dishes of anchovies, sardines, and other relishes of the kind, served in the first course.

Macaroncini—a small kind of maccaroni.

Maigre—made without meat.

Matelote—a rich and expensive stew of fish with wine, generally of carp, eels, or trout.

Meringue—a cake, or icing, made of sugar and whites of egg beaten to snow.

Meringué—covered or iced with a meringue-mixture.

Nouilles—a paste made of yolks of egg and flour, then cut small like vermicelli.

Purée—meat, or vegetables, reduced to a smooth pulp, and then mixed with sufficient liquid to form a thick sauce or soup.

Quenelles—French forcemeat, for which see page 163.

Rissoles—small fried pastry, either sweet or savoury.

Sparghetti—Naples vermicelli.

Stock—the unthickened broth or gravy which forms the basis of soups and sauces.

Tammy—a strainer of fine thin woollen canvas.

Timbale—a sort of pie made in a mould.

Tourte—a delicate kind of tart, baked generally in a shallow tin pan, or without any: see page 574.

Vol-au-vent—for this, see page 357.

Zita—Naples maccaroni.

TABLE OF CONTENTS.

CHAPTER I.

SOUPS.

Page

Ingredients which may all be 1 used for making Soup of various kinds

A few directions to the Cook 2

The time required for boiling 4 down Soup or Stock

To thicken Soups 4

To fry Bread to serve with 5 Soup

Sippets _à la Reine_ 5

To make _Nouilles_ (an elegant 5 substitute for Vermicelli)

Vegetable Vermicelli 5 (Vegetables cut very fine for Soups)

Extract of Beef, or very 6 strong Beef Gravy-Soup (Baron Liebig’s receipt)

Bouillon (the common Soup of 7 France), cheap and very wholesome

Clear pale Gravy Soup, or 10 _Consommé_

Another receipt for Gravy Soup 10

Cheap clear Gravy Soup 11

Glaze (Note) 11

Vermicelli Soup (_Potage au 12 Vermicelle_)

Semoulina Soup (_Soupe à la 12 Semoule_)

Macaroni Soup 13

Soup of _Soujee_ 13

Potage aux Nouilles, or 14 Taillerine Soup

Sago Soup 14

Tapioca Soup 14

Rice Soup 14

White Rice Soup 15

Rice-Flour Soup 15

Stock for White-Soup 15

Mutton Stock for Soups 16

Mademoiselle Jenny Lind’s Soup 16

The Lord Mayor’s Soup 17

The Lord Mayor’s Soup 18 (Author’s receipt)

Cocoa-Nut Soup 19

Chestnut Soup 19

Jerusalem Artichoke, or 19 Palestine Soup

Common Carrot Soup 20

A finer Carrot Soup 20

Common Turnip Soup 21

A quickly made Turnip Soup 21

Potato Soup 21

Apple Soup 21

Parsnep Soup 22

Another Parsnep Soup 22

Westerfield White Soup 22

A richer White Soup 23

Mock-Turtle Soup 23

Old-fashioned Mock-Turtle 26

Good Calf's-Head Soup (_not 27 expensive_)

Soupe des Galles 28

Potage à la Reine (a 29 delicate White Soup)

White Oyster Soup (or Oyster 30 Soup _à la Reine_)

Rabbit Soup _à la Reine_ 31

Brown Rabbit Soup 31

Superlative Hare Soup 32

A less expensive Hare Soup 32

Economical Turkey Soup 33

Pheasant Soup 33

Another Pheasant Soup 34

Partridge Soup 35

Mullagatawny 35

To boil Rice for Mullagatawny, 36 or for Curries

Good Vegetable Mullagatawny 37

Cucumber Soup 38

Spring Soup, and Soup _à la 38 Julienne_

An excellent Green Peas Soup 39

Green Peas Soup without meat 39

A cheap Green Peas Soup 40

Rich Peas Soup 41

Common Peas Soup 41

Peas Soup without meat 42

Ox-tail Soup 43

A cheap and good Stew Soup 43

Soup in haste 43

Veal or Mutton Broth 44

Milk Soup with Vermicelli (or 44 with Rice, Semoulina, Sago, &c.)

Cheap Rice Soup 44

Carrot Soup Maigre 45

Cheap Fish Soups 46

Buchanan Carrot Soup 46 (excellent)

Observation 47

CHAPTER II.

FISH.

Page

To choose Fish 48

To clean Fish 50

To keep Fish 51

To sweeten tainted Fish 51

The mode of cooking best 51 adapted to different kinds of Fish

The best mode of boiling Fish 53

Brine for boiling Fish 54

To render boiled Fish firm 54

To know when Fish is 55 sufficiently boiled, or otherwise cooked

To bake Fish 55

Fat for frying Fish 55

To keep Fish hot for table 56

To boil a Turbot (_and when in 56 season_)

Turbot _à la Crême_ 57

Turbot _au Béchamel_ 57

Mould of cold Turbot with Shrimp Chatney (refer to Chapter VI.)

To boil a John Dory (_and when 58 in season_)

Small John Dories baked. Good 58 (Author’s receipt)

To boil a Brill 58

To boil Salmon (_and when in 59 season_)

Salmon _à la Genevese_ 50

Crimped Salmon 60

Salmon _à la St. Marcel_ 60

Baked Salmon over mashed 69 Potatoes

Salmon Pudding, to be served 60 hot or cold (_a Scotch receipt. Good_)

To boil Cod Fish (_and when in 61 season_)

Slices of Cod Fish Fried 61

Stewed Cod 62

Stewed Cod Fish in brown sauce 62

To boil Salt Fish 62

Salt Fish _à la Maître 63 d’Hôtel_

To boil Cods’ Sounds 63

To fry Cods’ Sounds in batter 63

To fry Soles (_and when in 64 season_)

To boil Soles 64

Fillets of Soles 65

Soles _au Plat_ 66

Baked Soles (_a simple but 66 excellent receipt_)

Soles stewed in cream 67

To fry Whitings (_and when in 67 season_)

Fillets of Whitings 68

To boil Whitings (_French 68 receipt_)

Baked Whitings _à la 68 Française_

To boil Mackerel (_and when in 69 season_)

To bake Mackerel 69

Baked Mackerel or Whitings 70 (_Cinderella’s receipt. Good_)

Fried Mackerel (_Common French 70 receipt_)

Fillets of Mackerel (_fried or 71 broiled_)

Boiled fillets of Mackerel 71

Mackerel broiled whole (_an 71 excellent receipt_)

Mackerel stewed with Wine 72 (_very good_)

Fillets of Mackerel stewed in 72 Wine (_excellent_)

To boil Haddocks (_and when in 73 season_)

Baked Haddocks 73

To fry Haddocks 73

To dress Finnan Haddocks 74

To boil Gurnards (_with 74 directions for dressing them in other ways_)

Fresh Herrings. Farleigh 74 receipt (_and when in season_)

To dress the Sea Bream 75

To boil Plaice or Flounders 75 (_and when in season_)

To fry Plaice or Flounders 75

To roast, bake, or broil Red 76 Mullet (_and when in season_)

To boil Grey Mullet 76

The Gar Fish (_to bake_) 77

The Sand Launce, or Sand Eel 77 (_mode of dressing_)

To fry Smelts (_and when in 77 season_)

Baked Smelts 78

To dress White Bait. Greenwich 78 receipt (_and when in season_)

Water Souchy (_Greenwich 78 receipt_)

Shad, Touraine fashion (_also 79 à la mode de Touraine_)

Stewed Trout. Good common 80 receipt (_and when in season_)

To boil Pike (_and when in 80 season_)

To bake Pike (_common 81 receipt_)

To bake Pike (_superior 81 receipt_)

To stew Carp (_a common 82 country receipt_)

To boil Perch 82

To fry Perch or Tench 83

To fry Eels (_and when in 83 season_)

Boiled Eels (_German receipt_) 83

To dress Eels (_Cornish 84 receipt_)

Red Herrings _à la Dauphin_ 84

Red Herrings (_common English 84 mode_)

Anchovies fried in batter 84

CHAPTER III.

DISHES OF SHELL-FISH.

Page

Oysters, to cleanse and feed 85 (_and when in season_)

To scallop Oysters 86

Scalloped Oysters _à la Reine_ 86

To stew Oysters 86

Oyster Sausages (_a most 87 excellent receipt_)

To boil Lobsters (_and when in 88 season_)

Cold dressed Lobster and Crab 88

Lobsters fricasseed, or _au 89 Béchamel_ (_Entrée_)

Hot Crab or Lobster 89

Potted Lobsters 90

Lobster cutlets (_a superior 91 Entrée_)

Lobster Sausages 91

Boudinettes of Lobsters, 92 Prawns, or Shrimps. _Entrée_ (_Author’s receipt_)

To boil Shrimps or Prawns 93

To dish cold Prawns 93

To shell Shrimps and Prawns 93 quickly and easily

CHAPTER IV.

GRAVIES.

Page

Introductory remarks 94

Jewish smoked Beef (_extremely 95 useful for giving flavour to Soups and Gravies_)

To heighten the colour and 96 flavour of Gravies

Baron Liebeg’s Beef Gravy 96 (_most excellent for Hashes, Minces, and other dishes made of cold meat_)

Shin of Beef Stock for Gravies 97

Rich pale Veal Gravy or 97 _Consommé_

Rich deep coloured Veal Gravy 98

Good Beef or Veal Gravy 99 (_English receipt_)

A rich English brown Gravy 99

Plain Gravy for Venison 100

A rich Gravy for Venison 100

Sweet Sauce, or Gravy for 100 Venison

Espagnole, Spanish Sauce (_a 100 highly flavoured Gravy_)

Espagnole with Wine 100

Jus des Rognons, or Kidney 101 Gravy

Gravy in haste 101

Cheap Gravy for a Roast Fowl 101

Another cheap Gravy for a Fowl 102

Gravy or Sauce for a Goose 102

Orange Gravy for Wild Fowl 102

Meat Jellies for Pies and 103 Sauces

A cheaper Meat Jelly 103

Glaze 104

Aspic, or clear savoury 104 Jelly

CHAPTER V.

SAUCES.

Page

Introductory remarks 105

To thicken Sauces 105

French thickening, or brown 106 _Roux_

White _Roux_, or French 106 thickening

Sauce Tournée, or pale 106 thickened Gravy

Béchamel 107

Béchamel Maigre (_a cheap 108 white Sauce_)

Another common _Béchamel_ 108

Rich melted Butter 108

Melted Butter (_a good common 108 receipt_)

French melted Butter 109

Norfolk Sauce, or rich melted 109 Butter without Flour

White melted Butter 109

Burnt or browned Butter 109

Clarified Butter 110

Very good Egg Sauce 110

Sauce of Turkeys’ Eggs Sauce 110 (_excellent_)

Common Egg Sauce 110

Egg Sauce for Calf’s Head 111

English White Sauce 111

Very common White Sauce 111

Dutch Sauce 111

Fricassee Sauce 112

Bread Sauce 112

Bread Sauce with Onion 113

Common Lobster Sauce 113

Good Lobster Sauce 113

Crab Sauce 114

Good Oyster Sauce 114

Common Oyster Sauce 114

Shrimp Sauce 115

Anchovy Sauce 115

Cream Sauce for Fish 114

Sharp _Maître d’Hôtel_ Sauce 116 (_English receipt_)

French _Maître d’Hôtel_, or 116 Steward’s Sauce

Maître d’Hôtel Sauce Maigre, 117 or without Gravy

The Lady’s Sauce for Fish 117

Genevese Sauce, or _Sauce 117 Genevoise_

Sauce Robert 118

Sauce Piquante 118

Excellent Horseradish Sauce, 118 to serve hot or cold with roast Beef

Hot Horseradish Sauce 119

Christopher North’s own Sauce 119 for many Meats

Gooseberry Sauce for Mackerel 120

Common Sorrel Sauce 120

Asparagus Sauce for Lamb 120 Cutlets

Caper Sauce 121

Brown Caper Sauce 121

Caper Sauce for Fish 121

Common Cucumber Sauce 121

Another common Sauce of 122 Cucumbers

White Cucumber Sauce 122

White Mushroom Sauce 122

Another Mushroom Sauce 123

Brown Mushroom Sauce 123

Common Tomata Sauce 123

A finer Tomata Sauce 124

Boiled Apple Sauce 124

Baked Apple Sauce 124

Brown Apple Sauce 125

White Onion Sauce 125

Brown Onion Sauce 125

Another brown Onion Sauce 125

Soubise 126

Soubise (_French receipt_) 126

Mild Ragout of Garlic, or 126 _l'Ail à la Bordelaise_

Mild Eschalot Sauce 127

A fine Sauce, or _Purée_ of 127 Vegetable Marrow

Excellent Turnip, or Artichoke 127 Sauce, for boiled Meat

Olive Sauce 128

Celery Sauce 128

White Chestnut Sauce 129

Brown Chestnut Sauce 129

Parsley-green, for colouring 129 Sauces

To crisp Parsley 130

Fried Parsley 130

Mild Mustard 130

Mustard, the common way 130

French Batter for frying 130 vegetables, and for Apple, Peach, or Orange fritters

To prepare Bread for frying 131 Fish

Browned Flour for thickening 131 Soups and Gravies

Fried Bread-Crumbs 131

Fried Bread for Garnishing 131

SWEET PUDDING SAUCES, CHAPTER XXII.

CHAPTER VI.

COLD SAUCES, SALADS, ETC.

Page

Superior Mint Sauce, to serve 132 with Lamb

Common Mint Sauce 132

Strained Mint Sauce 132

Fine Horseradish Sauce, to 133 serve with cold roast, stewed, or boiled Beef

Cold _Maître d'Hôtel_, or 133 Steward's Sauce

Cold Dutch or American Sauce, 133 for Salads of dressed Vegetables, Salt Fish, or hard Eggs

English Sauce for Salad, cold 134 Meat, or cold Fish

The Poet's receipt for Salad 135

Sauce Mayonnaise, for 135 Salads, cold Meat, Poultry, Fish, or Vegetables

Red or green _Mayonnaise_ 136 Sauce

Imperial _Mayonnaise_, an 136 elegant Jellied Sauce or Salad dressing

Remoulade 137

Oxford Brawn Sauce 137

Forced Eggs for garnishing 137 Salads

Anchovy Butter (_excellent_) 138

Lobster Butter 138

Truffled Butter, and Truffles 139 potted in Butter for the Breakfast or Luncheon table

English Salads 140

French Salad 140

French Salad—Dressing 140

Des Cerneaux, or Walnut 141 Salad

Suffolk Salad 141

Yorkshire Ploughman's Salad 141

An excellent Salad of young 141 Vegetables

Sorrel Salad, to serve with 142 Lamb Cutlets, Veal Cutlets, or roast Lamb

Lobster Salad 142

An excellent Herring Salad 143 (_Swedish receipt_)

Tartar Sauce (_Sauce à la 143 Tartare_)

Shrimp Chatney (_Mauritian 144 receipt_)

Capsicum Chatney 144

CHAPTER VII.

STORE SAUCES.

INTRODUCTORY CHAPTERS.

TRUSSING.

[Illustration:

Trussing Needles.]

COMMON and untrained cooks are often deplorably ignorant of this branch of their business, a knowledge of which is, nevertheless, quite as essential to them as is that of boiling or roasting; for without it they cannot, by any possibility, serve up dinners of decently creditable appearance. We give such brief general directions for it as our space will permit, and as our own observations enable us to supply; but it has been truly said, by a great authority in these matters, that trussing cannot be "_taught by words_;" we would, therefore, recommend, that instead of relying on any written instructions, persons who really desire thoroughly to understand the subject, and to make themselves acquainted with the mode of entirely preparing all varieties of game and poultry more especially for table, in the very best manner, should apply for some _practical_ lessons to a first-rate poulterer; or, if this cannot be done, that they should endeavour to obtain from some well experienced and skilful cook the instruction which they need.

GENERAL DIRECTIONS FOR TRUSSING.

Before a bird is trussed, the skin must be entirely freed from any down which may be on it, and from all the stubble-ends of the feathers;[3] the hair also must be singed from it with lighted writing paper, care being taken not to smoke nor blacken it in the operation. Directions for cleansing the insides of birds after they are drawn, are given in the receipts for dressing them, Chapters XIV. and XV. Turkeys, geese, ducks, wild or tame, fowls, and pigeons, should all have the necks taken off close to the bodies, but not the skin of the necks, which should be left sufficiently long to turn down upon the backs for a couple of inches or more, where it must be secured, either with a needle and coarse soft cotton, or by the pinions of the birds when trussed.

Footnote 3:

This should be _particularly_ attended to.

[Illustration]

For boiling, all poultry or other birds must have the feet drawn off at the first joint of the leg, or as shown in the engraving. (In the latter case, the sinews of the joint must be slightly cut, when the bone may be easily turned back as here.) The skin must then be loosened with the finger entirely from the legs, which must be pushed back into the body, and the small ends tucked quite under the apron, so as to be entirely out of sight.

[Illustration]

The wings of chickens, fowls, turkeys, and pigeons, are left on entire, whether for roasting or boiling. From geese, ducks, pheasants, partridges, black game, moor-fowl, woodcocks, snipes, wild-fowl of all kinds, and all small birds, the first two joints are taken off, leaving but one joint on, thus:—

The feet are left on ducks, and those of tame ones are trussed as will be seen at page 278, and upon roast fowls, pheasants, black and moor-game, pigeons, woodcocks, and snipes. The thick coarse skin of the legs of these must be stripped, or rubbed off with a hard cloth after they have been held in boiling water, or over a clear fire for a few minutes. The sharp talons must be pulled out, and the nails clipped. The toes of the pigeons for roasting should be cut off.

Geese, sucking-pigs, hares, and rabbits have the feet taken off at the first joint.

The livers and gizzards are served in the wings of roast turkeys and fowls only.

The heads are still commonly left on pheasants, partridges, and black game and moor-game; but the fashion is declining. Of this we shall speak more particularly in the ensuing chapter.

Poultry and birds in general, except perhaps quite the larger kinds, are more easily trussed into plump handsome form with twine and needles proper to the purpose (for which see page 1), than with skewers. The manner in which the legs and wings are confined is much the same for all; the principal difference being in the arrangement of the former for boiling, which has already been explained.

There is a present mode of trussing very large fowls for boiling or stewing which to our taste is more novel than attractive. The feet are left on, and after the skin has been loosened from them in every part, the legs are thrust entirely into the body by means of a slight incision made in the skin just above the first joint on the underside, the feet then appear almost as if growing out of the sides of the breast: the effect of this is not pleasing.

TO TRUSS A TURKEY, FOWL, PHEASANT OR PARTRIDGE, FOR ROASTING.

First draw the skin of the neck down over the back, and secure it from slipping up; then thread a trussing needle of convenient size,[4] for the occasion, with packthread or small twine (the former, from being the most flexible, is best); pass it through the pinion of the bird, then through the thick part of the thigh, which must be brought up close _under the wing_, and in a straight line quite through the body, and through the leg and pinion on the other side; draw them close, and bring the needle back, passing it through the thick part of the leg, and through the second joint of the pinion, should it be left on the bird; tie it quite tight; and then to secure the legs, pierce the sidebone and carry the twine over the legs, then pass the needle through the other sidebone, and tie them close down. If skewers be used they should be driven through the pinions and the legs, and a twine passed across the back of the bird, and caught over the points of it, and then tied in the centre of the back: this is only needful when the trussing is not firm.

Footnote 4:

These may be had, of various sizes, at any good ironmongers.

[Illustration]

When the head is left on a bird, it may still be trussed in the same way, and the head brought round, as shown here, and kept in place by a skewer passed through it, and run through the body. When the bird is trussed entirely with skewers, the point of one is brought from the other side, through the pinions and the thighs, and the head is fixed upon it. The legs are then pressed as much as possible under the breast, between it and the side-bones, where they are lettered _a b_. The partridge in the engraving is shown with the skewers just withdrawn after being roasted.

Hares, after being filled with forcemeat, and sewn or securely fastened up with skewers, are brought into proper roasting form by having the head fixed between the shoulders, and either fastened to the back by means of a long skewer, run through the head quite into it, or by passing one through the upper part of the shoulders and the neck together, which will keep it equally well in place, though less thrown back. The fore-legs are then laid straight along the sides of the hare, and a skewer is thrust through them both and the body at the same time; the sinews are just cut through under the hind-legs, and they are brought forward as much as possible, and skewered in the same manner as the others. A string is then thrown across, under the hare and over the points of both skewers, being crossed before it is passed over the second, and then tied above the back. The ears of a hare are left on; those of a rabbit, which is trussed in the same way, are taken off.

[Illustration:

Paste Brush.]

Joints of meat require but little arrangement, either for the spit or for boiling. A fillet of veal must have the flap, or part to which the fat adheres, drawn closely round the outside, and be skewered or bound firmly into good shape: this will apply equally to a round of beef. The skin or flank of loins of meat must be wrapped over the ends of the bones, and skewered on the underside. _The cook should_ _be particularly careful to separate the joints when it has not been done by the butcher_, and necks of veal or mutton also, or much trouble will often arise to the carver.

[Illustration:

Cutlet Bat.]

To flatten and bring cutlets into uniform shape, a bat of this form is used: and to egg or to cover them with clarified butter when they are to be crumbed, a paste-brush should be at hand. Indeed, these and many other small means and appliances, ought to be provided for every cook who is expected to perform her duty in a regular and proper manner, for they save much time and trouble, and their first expense is very slight; yet many kitchens are almost entirely without them.

TO TRUSS FISH.

Salmon, salmon-peel, pike, and some few other large fish, are occasionally trussed in the form of an S by passing a string through the head, and tying it securely, then through the centre of the body, and next round the tail, which should be turned the reverse way of the head, and the whole should then be drawn closely together and well fastened. Whitings and other fish of small size are trussed with the tails merely skewered into their mouths. _Obs._—It is indispensable for cooks to know how to carve neatly for pies, puddings, fricassees, and curries, at the least, hares, rabbits, fowls, and other birds. For those who are quite without experience in this branch of their business, the directions and the illustrations in the next chapter for carving a fowl into joints, will be found useful; and probably many of the other instructions also.

CARVING.

[Illustration:

Fish Carvers.]

Whether the passing fashion of the day exact it of her or not, a gentlewoman should always, for her own sake, be able to carve well and easily, the dishes which are placed before her, that she may be _competent_ to do the honours of a table at any time with propriety and self-possession.[5] To gentlemen, and especially to those who mix much in society, some knowledge of this art, and a

certain degree of skill in the exercise of it, are indispensable, if they would avoid the chance of appearing often to great disadvantage themselves, and of causing dissatisfaction and annoyance to others; for the uncouth operations of bad carvers occasion almost as much discomfort to those who witness, as they do generally of awkwardness and embarrassment to those who exhibit them.

Footnote 5:

As this can only be accomplished by practice, young persons should be early accustomed to carve at home, where the failure of their first attempts will cause them much less embarrassment than they would in another sphere, and at a later period of life.

The precise mode of carving various dishes must of course depend on many contingencies. For a plain family-dinner, or where strict economy is an imperative consideration, it must sometimes, of necessity, differ from that which is laid down here. We have confined our instructions to the fashion usually adopted in the world.

Carving knives and forks are to be had of many forms and sizes, and adapted to different purposes: the former should always have a very keen edge, and the latter two prongs only.

No. 1. COD'S HEAD AND SHOULDERS (AND COD FISH GENERALLY.)

The thick part of the back of this, as of all large fish—salmon excepted—is the firmest and finest eating. It should be carved across, rather thick, and, as much as possible, in unbroken slices, from _a_ to _b_. The sound, which is considered a delicacy, lies underneath, and lines the back-bone: it must be reached with a spoon in the direction _c_. The middle of the fish, when served to a family party, may be carved in the same manner, or in any other which convenience and economy may dictate.

No. 2. A TURBOT.

In carving this most excellent fish, the rich gelatinous skin attached to it, and a portion of the thick part of the fins, should be served with every slice. If the point of the fish-knife be drawn down the centre of the back through to the bone, in the lines _a b c_, and from thence to _d d d_, the flesh may easily be raised upon the blade in handsome portions,. The thickest parts of all flat fish are the best. A brill and a John Dory are served exactly like a turbot.

SOLES.

The more elegant mode of serving these, and the usual one at good tables, is to raise the flesh from the bones as from a turbot, which is easily done when the fish are large; but when they are too small well to admit of it, they must be divided across quite through the bone: the shoulders, and thick part of the body, are the superior portions.

No. 3. SALMON.

It is customary to serve a slice of the thick part of the back of this fish, which is marked from _a_ to _b_, with one of the thinner and richer portions of it, shown by the line from _c_ to _d_. It should be carved quite straight across, and the fine flakes of the flesh should be preserved as entire as possible. Salmon-peel, pike, haddocks, large whitings, and all fish which are served curled round, and with the backs uppermost, are carved in the same manner; the flesh is separated from the bone in the centre of the back, and taken off, on the outer side first, in convenient portions for serving. The flesh of mackerel is best raised from the bones by passing the fish-slice from the tail to the head: it may then be divided in two.

No. 4. SADDLE OF MUTTON.

The manner of trussing this joint varies almost from season to season, the mode which is considered in good taste one year being obsolete the next, in families where passing fashions are closely observed. It seems really immaterial whether it be served as shown in the engraving; or whether two or three joints of the tail be left on and surrounded with a paper frill. This joint is now trussed for roasting in the manner shown in the engraving; and when it is dished a silver skewer replaces the one marked _e_. It is likewise often still served in good families with only two or three joints of the tail left on. The most usual mode of carving it is in thin slices cut quite along the bone, on either side, in the line _a_ to _b_; but it is sometimes sliced obliquely from _c_ to _d_: this last fashion is rather gaining ground. The thick end of the joint must then, of course, be to the left of the carver. A saddle of pork or of lamb is carved exactly in the same manner.

No. 5. A HAUNCH OF VENISON (OR MUTTON.)

An incision must first be made entirely across the knuckle end of this joint, quite down to the bone, in the line _a b_, to let the gravy escape; it must then be carved in thin slices taken as deep as they can be, the whole length of the haunch, from _c_ to _d_. A portion of the fat should invariably be served with the venison.

No. 6. SIRLOIN OR RUMP OF BEEF.

As the very tender part of this favourite joint, which lies under the bone, and is called the _fillet_, is preferred by many eaters, the beef should be raised, and some slices be taken from it in the direction _a b_, before the carver proceeds further. The slices should be cut quite across the joint, from side to side, as indicated by the line from _c_ to _d_, in which direction the whole of the meat is occasionally carved, though it is much more usual to slice the upper part from _e_ to _f_. When the brown outside has been taken off this, it should be evenly carved in thin slices, and served with some of the gravy in the dish, and accompanied with horseradish very lightly and finely scraped, with tufts of which the beef is commonly garnished.

RIBS OF BEEF.

Are carved in the same manner as the sirloin; but there is no fillet attached to them.

A ROUND OF BEEF.

To carve this well, a very sharp-edged and thin-bladed knife is requisite. A thick slice should first be taken entirely off the top of the joint, leaving it very smooth; it should then be cut as thin and as evenly as possible, and delicate slices of the fat or udder should be served with the lean.

A BRISKET OF BEEF

Is carved in slices quite across the bones.

No. 7. LEG OF MUTTON.

This, whether roast or boiled, is dished as it lies in the engraving, unless when fanciful eaters prefer the underside of the joint laid uppermost, and carved quite across the middle, for the sake of the finely grained meat which lies beneath the part commonly called the Pope’s eye. In a general way, the mutton should be sliced, rather thick than thin as directed by the line between _a b_; the fat will be found in the direction _c d_.

No. 8. QUARTER OF LAMB.

The shoulder must be divided, and raised entirely from the breast in the direction of the letters _a b c d_. A slice of butter sprinkled with cayenne and salt is then usually laid between them, and a little lemon-juice is added, or a cold _Mâitre d’Hôtel_ sauce is substituted for these. The shoulder may then be removed into another dish or not, as is most convenient. The brisket is next separated from the long bones in the line _e f_, and carved in the direction g h; the rib-bones are divided from _i i_ to _j j_. The choice of the different parts is offered in serving them.

No. 9. SHOULDER OF MUTTON OR LAMB.

Commence by cutting from the outer edge direct to the bone of the shoulder in the line _a b_, and carve as many slices from that part of the joint as it will afford: then, if more be required, draw the knife on either side of the ridge of the blade-bone in the direction _c c d d_. The fat must be carved in the line _e f_. Some eaters have a preference for the juicy, but not very finely-grained flesh on the underside of the shoulder, which must be turned, for it to be carved. For the mode of boning a shoulder of mutton or veal, and giving it a more agreeable appearance, see 219.

No. 10. A SUCKING PIG.

Every part of a sucking pig is good, but some persons consider the flesh of the neck which lies between the shoulders, and the ribs as the most delicate portion of it. The shoulders themselves are preferred by others. They should be taken off, and the legs also, by passing the knife under them at the letters _a b c_. The ribs may then be easily divided from _e_ to _d_. The flesh only of the larger

joints should be served to ladies; but gentlemen often prefer it sent to them on the bones.

A FILLET OF VEAL.

There is no difference between the mode of carving this and a round of beef; but the brown outside slice of the veal is much liked by many eaters, and a portion of it should be served to them when it is known to be so. The forcemeat must be reached by cutting deeply into the flap, and a slice of it served always with the veal.

A LOIN OF VEAL.

This may be carved at choice quite across through the thick part of the flesh, or in slices taken in the direction of the bones. A slice of the kidney, and of the fat which surrounds it, should accompany the veal.

No. 11. A BREAST OF VEAL.

The brisket or gristles[6] of this joint must first be entirely separated from the rib-bones by pressing the knife quite through it in the line between _a_ and _b_; this part may then be divided as shown by the letters _c c d d d_, and the long bones or ribs may easily be separated in the direction _e f_. The taste of those who are served should be consulted as to the part of the joint which is preferred. The sweetbread is commonly sent to table with a roast breast of veal, and laid upon it: a portion of it should be served with every plate of the breast.

Footnote 6:

The _tendons_ are literally the small white gristles themselves, which are found under the flesh in this part of the joint. When freed from the bone attached to them, they may be dressed in a variety of ways, and are extremely good: but they require from four to six hours' stewing to render them perfectly tender, even when each tendon is divided into three or four slices. The upper flesh must be laid back from the tendons before they are taken from the breast, not left adhering to them. They are very good simply stewed in white gravy, and served with green peas, _à la Française_, in the centre. The breast entirely boned, forced, and rolled, makes a handsome dish, either roasted or stewed.

No. 12. A TONGUE.

This is sliced, not very thin, through the thickest and best part, shown by the letters _a b_. The fat of the root, when it is liked, must be carved by turning the tongue, and cutting in the direction _c d_.

No. 13. A CALF'S HEAD.

[Illustration]

An entire calf's head, served in its natural form, recalls too forcibly the appearance of the living animal to which it has belonged not to be very uninviting. Even when the half of one only is sent to table, something of the same aspect remains, and as it is in every way improved, and rendered most easy to carve when boned[7] and rolled, we would recommend its being so prepared whenever it can be done without difficulty. Our engraving does not give a very flattering representation of it in that form, but having been dressed with the skin on, it was not quite so easily brought into handsome shape as if it had been freed from it; yet we would nevertheless advise its being generally retained. When the head is served without being boned, it is carved across the cheek, in the line from _a_ to _b_; the part which in flavour and appearance resembles a sweetbread, and which is regarded as a delicacy, lies in the direction indicated by the letters _c d_. The flesh of the eye is another favourite morsel, which must be detached from the head by passing the point of the carving knife deeply round the eye-hole, in the circle marked _e e_.

Footnote 7:

This will be more easily accomplished by an experienced cook after the head has been boiled for half an hour and then allowed to cool; but it should not be left until cold before it is altogether prepared for dressing. After the bones are removed, it should be laid on a clean cloth, and the inside sprinkled over or rubbed with a little salt, mace, and cayenne, well mixed together; the tongue may be laid upon, and rolled up in it. It must be secured, first with a skewer, and then bound tightly round with tape. It should be boiled or stewed extremely tender; and is excellent when just covered with good stock, and simmered for two hours, or when strong broth is substituted for this, and the bones are added to it. The head may be glazed, and served with rich brown gravy, or with the ordinary

sauces if preferred; and it may be eaten cold, with Oxford brawn sauce, which is compounded of brown sugar, vinegar, mustard, and salt, mixed to the taste, with the addition of oil when it is liked.

No. 14. A HAM.

Strict economists sometimes commence the carving of a ham at the knuckle, and so gradually reach the choicer portion of it; but this method is not at all to be recommended. It should be cut at once through the thick part of the flesh, quite down to the bone, in the line _a b_, and sliced very thin and evenly, without separating the fat from the lean. The decoration of the ham No. 14, is formed by leaving on it a portion of the rind at the knuckle in a semi-circle, and then trimming it into scollops or points at pleasure; and the ornamental part of the top is formed from the fat which is pared away from the thick end and the edges. A paper ruffle, as will be seen, is wrapped round the bone of the knuckle.

No. 15. A PHEASANT.

This bird was formerly always sent to table with the head on, but it was a barbarous custom, which has been partially abandoned of late in the best houses, and which it is hoped may soon be altogether superseded by one of better taste. The breast is by far the finest part of a pheasant, and it is carved in slices from pinion to pinion, in the lines _a a b b_; the legs may then be taken off, in the direction _c d_. The bird, when it is preferred so, may be entirely dismembered by the directions for a fowl, No. 16. Black and moor-game are trussed and served like pheasants. The breasts of both are very fine eating, and the thigh of the black-cock is highly esteemed.

No. 16. A BOILED FOWL.

The boiled fowl of plate 6 is represented as garnished with branches of parsley, which is an error, as they would be appropriate to it only if it were cold, and it is seldom served so, being considered insipid. Small tufts of cauliflower would have been in better keeping with it, as the bird is supposed to be dished for the dinner-table. Unless it be for large family parties, fowls are seldom carved there entirely into joints; but when it is wished to divide them so, the fork should be fixed firmly in the centre of the breast, and the leg, being first disengaged from the skin, may be taken off with the wing in the line _a b_; or, the wing being previously removed, by carving it down the line to _b_, and there separating it from the neck-bone, the leg may be released from the skin, and easily taken off, by cutting round it from _a_ to _c_, and then turning it with the fork, back from the body, when the joint will readily be perceived.

[Illustration]

After the leg and wing on the other side have been taken off in the same manner, the merrythought must follow. To remove this, the knife must be drawn through the flesh in the line _d e_, and then turned towards the neck quite under the merrythought, which it will so lift from the breast, in this form:—The neck-bones—which lie close under the upper part of the wings, and are shaped thus—must next be disengaged from the fowl, by putting the knife in at the top of the joint, dividing the long part of the bone from the flesh, and breaking the short one off by raising it up, and turning it from the body; the breast, which is shown here, may then be divided from it by merely cutting through the tender ribs on either side.

[Illustration]

It is seldom that further disjointing than this is required at table; but when it is necessary to cut up the entire fowl, the remainder of it must be laid with the back uppermost, and to take off the side-bones, which are of this shape—the point of the knife must be pressed through the back-bone, near the top, about half an inch from the centre, and brought down towards the end of the back, quite through the bone, then turned in the opposite direction, when the joints will separate without difficulty. All which then remains to be done is, to lay the edge of the knife across the middle of the only two undivided bones, and then with the fork to raise the small end of the fowl, which will part them immediately: to carve a boiled fowl or chicken in a more modern manner, see the directions which follow. The breast, wings, and merrythought, are the most delicate parts of a fowl. On the upper part of the sidebone is the small round portion of flesh called the _oyster_, by many persons considered as a great delicacy.

No. 17. A ROAST FOWL.

It is not usual to carve fowls entirely at table in the manner described above. The wings, and any other joints are taken off only as they are required. The breast of a very large fowl may be carved in slices like that of a turkey; or the whole of that of a small one may be taken off with the wings, as shown by the line _a b_. As the liver is a delicacy, the handsomer mode of serving these last is

to remove the gizzard, which is seldom eaten, then to divide the liver, and to send an equal portion of it with each wing. The whole of a roast fowl may be carved by the directions we have already given for No. 16.

No. 18. A PARTRIDGE.

[Illustration]

When partridges are served to ladies only, or in parties where they are present, it is now customary to take off the heads, to truss the legs short, and to make them appear (in poulterer's phrase) _all breast_. For gentlemen's dinners, the heads may be left on or not at choice. The most ready mode of carving a partridge is to press back the legs, then to fix the fork firmly in the inside of the back, and by passing the blade of the knife flat under the lower part of the breast, to raise it, with the wings, entire from the body, from which it easily separates. The breast may then be divided in the middle, as shown by the line from _a_ to _b_ in the engraving here. This is by far the best and handsomest manner of carving a partridge, but when the supply of game at table is small, and it is necessary to serve three persons from the choicer parts of one bird, a not very large wing should be taken off with the leg on either side, in the line from _a_ to _b_ in No. 13, and sufficient of the breast will still remain to send to a third eater. The high game-flavour of the back of a partridge, as well as that of various other birds,[8] is greatly relished by many persons.

Footnote 8:

A great man o the north eloquently describes that of a grouse as "the most pungent, palate-piercing, wild bitter-sweet."

No. 19. A WOODCOCK.

[Illustration]

The thigh and back are the most esteemed parts of a woodcock which, being a small bird, may be carved entirely through the centre of the breast and back, or distributed in the same manner as the partridge for three, which we have described; or even carved down like a fowl, if needful. In whatever way it is divided, however, a portion of the toast which has received the trail, and on which it should always be sent to table, must invariably be served to all who partake of it. The very old fashion of trussing the bird with its own bill, by running it through the thighs and body, is again adopted by very good cooks of the present day; but the common method of preparing either woodcocks or snipes for table is this: the trussing of the legs is, however, better shown at Nos. 19 and 21 of Plate 6.

No. 20. A PIGEON.

The breast and wings of a pigeon may be raised in the same way as those of a partridge (see No. 18); or the bird may be carved entirely through in the line _a b_. For the second course, pigeons should be dished upon young delicate water-cresses.

No. 21. A SNIPE.

This bird is trussed, roasted, and served exactly like a woodcock. It is not of a size to require any carving, beyond dividing in two, if at all.

No. 22. A GOOSE.

The skin below the breast, called the apron, must first be cut off in a circular direction as indicated by the letters _a a a_, when a glass of port-wine or of claret, ready mixed with a teaspoonful of mustard, may be poured into the body or not, at choice. Some of the stuffing should then be drawn out with a spoon, and the neck of the goose, which ought to be to the right and not to the left hand, as here, being turned a little towards the carver, the flesh of the breast should be sliced in the lines from _b b b_ to _c c c_, on either side of the bone. The wings may then be taken off like those of any other bird, and then the legs, which, in the engraving No. 22, are trussed so completely under the apron as to render their outline scarcely distinguishable. Graceful and well-skilled carvers never turn birds on their sides to remove any of the joints, but those of a goose, unless it be very young, are sometimes severed from it with difficulty; and the common directions for assisting the process in that case are, to turn it on its side, and with the fork to press down the small end of the leg; then to pass the knife quite under it from the top down to the joint, when the leg should be turned back from the bird with the fork, while the thigh-bone is loosened from its socket with the knife. The end of the pinion marked _d_ is then held down in the same manner, to facilitate the separation of the bones at _e_, from which point the knife is drawn under the wing, which it takes off. The merrythought of a goose is small, and, to remove it the knife must first be turned a

little _from_ the neck, after the flesh has been cut through, and then passed under it, back towards the neck. For the remainder of the carving, the directions for that of a fowl will suffice.

DUCKS.

Tame ducks are served with the feet (which are liked by many people) left upon them and trussed up over the backs. If large they may be carved like a goose, but when very young may be disjointed like chickens; the only material difference between them being the position of the thigh-joints, which lie much further towards the back-bone than those of a fowl.

No. 23. A WILD DUCK.

The breasts of wild-fowl are the only parts of them held in much estimation, and these are carved in slices from the legs to the neck The legs and pinions may, if required, be taken off exactly like those of a pheasant.

No. 24. A TURKEY.

The carving of a turkey commences by taking slices off the breast, from the letters _b b_ quite through the forcemeat, which lies under the letter _a_, to _c c_: the greater part of the flesh of the wings is thus taken off likewise. When the bird is boned and filled with sausage or other forcemeat, the breast is carved entirely across in the direction _d e_, nearly, or quite down to the back, which it is better not altogether to divide at first, as the appearance of the turkey is not then so good. When it has been prepared in the ordinary manner, after the breast has been disposed of, the pinions and the legs may be taken off, the first in the line from _f_ to _g_, and the latter by passing the knife under it at _h_, and bringing it down to the joint at _i j_, where it must be taken off in the line shown. The whole of the joints being in form exactly like those of a fowl, may be separated in the same manner. The gizzard is more commonly eaten broiled after having been scored, and very _highly_ seasoned with cayenne and with a sufficiency of salt, than in any other way. A slice or portion of the liver should be served with the white flesh of the turkey as far as possible.

No. 25. A HARE.

A hare should be placed with its head to the left of the carver, therefore the engraving No. 25 shows it turned in the wrong direction. It is so very great an improvement to take out the back-bone before a hare is roasted, that we would recommend it to be done wherever it can be so without difficulty: it may then be carved in the line _a b_ quite through, or only partially so at choice. When the bone remains in, slices may be taken down the whole length of the back from _c c_ to _d d_; the legs, which, next to the back, are considered the best eating, may then be taken off in the direction _e f_ and the flesh divided from or served upon them, after the small bones have been parted from the thighs. The shoulders, which are not generally much esteemed, though sometimes liked by sportsmen, may next be taken off by passing the knife at the letters _g h_ between the joint and the body. When a hare is young, the back is sometimes divided at the joints into three or four parts, after being freed from the ribs and under-skin.

No. 26. A FRICANDEAU OF VEAL.

This is usually stewed, or rather braised sufficiently tender to be divided with a spoon, and requires no carving; but the fat (or underpart of the fillet) attached to it, marked _a a a_, which is sometimes, but not invariably served with it now, may be carved in even slices. The larding differs somewhat from that which we have described, but the mode shown here allows the _fricandeau_ to be glazed with more facility.

The engraving of the _entrée_ No. 26 is intended merely to show the manner of dishing the cutlets. They may be of mutton, lamb, veal, or pork; and the centre may be filled with the sauce or stewed, vegetable appropriate to either; as _soubise_, _purée_ of asparagus, of mushrooms, or of tomatas; or _green peas à la Française_, stewed cucumbers, or aught else that is suited to the kind of meat which is served.

MODERN COOKERY.

[Illustration]

CHAPTER I.

=Soups.=

INGREDIENTS WHICH MAY ALL BE USED FOR MAKING SOUP OF VARIOUS KINDS:—Beef—Mutton—Veal—Hams—Salted Pork—Fat Bacon—Pigs' Ears and Feet—Venison—Black and Moor Game—Partridges—Pheasants—Wild Pigeons—Hares—Rabbits—Turkeys—Fowls—Tame Pigeons—Sturgeon—Conger Eel, with all sorts of Fish usually eaten—All Shell-Fish—Every kind of Vegetable and Herb fit for food—Butter—Milk—Eggs—Rice—Sago—Arrow-Root—Indian Corn—Hominy—Soujee—Tapioca—Pearl Barley—Oatmeal—Polenta[9]—Macaroni—Vermicelli—Semoulina, and other Italian Pastes.

Footnote 9:

The name given in English commerce to the maize flour or meal of Italy.

THE art of preparing good, wholesome, palatable soups, _without great expense_, which is so well understood in France, and in other countries where they form part of the daily food of all classes of the people, has hitherto been very much neglected in England;[10] yet it really presents no difficulties which a little practice, and the most common degree of care, will not readily overcome; and we strongly recommend increased attention to it, not only on account of the loss and inconvenience which ignorance of it occasions in many households, but because a better knowledge of it will lead naturally to improvement in other branches of cookery connected with it in which our want of skill is now equally apparent.

Footnote 10:

The inability of servants to prepare delicately and well even a little broth suited to an invalid, is often painfully evident in cases of illness, not only in common English life, but where the cookery is supposed to be of a superior order.

We have endeavoured to show by the list at the beginning of this chapter the immense number of different articles of which soup may be in turn compounded. It is almost superfluous to add, that it may be rendered at pleasure exceedingly rich, or simple in the extreme; composed, in fact, of all that is most choice in diet, or of little beyond herbs and vegetables. From the varied produce of a

well-stored kitchen garden, it may be made excellent at a very trifling cost; and where fish is fresh and abundant it may be cheaply supplied nearly equal in quality to that for which a full proportion of meat is commonly used. It is best suited to the colder seasons of the year when thickened well with rice, semoulina, pearl barley, or other ingredients of the same nature; and adapted to the summer months when lighter and more refreshing. Families who have resided much abroad, and those accustomed to continental modes of service, prefer it usually _in any form_ to the more solid and heavy dishes which still often supersede it altogether at our tables[11] (except at those of the more affluent classes of society, where it appears, as a matter of course, in the daily bills of fare), and which are so _oppressive_, not only to foreigners, but to all persons generally to whom circumstances have rendered them unaccustomed diet; and many a housekeeper who is compelled by a narrow income to adopt a system of rigid domestic economy, would find it assist greatly in furnishing comfortable meals in a very frugal manner, if the proper modes of making it were fully comprehended as they ought to be.[12]

Footnote 11:

The popular taste in England, even at the present day, is far more in favour of what is termed “_substantial_” food, than of any kind of pottage.

Footnote 12:

We are unable to give further space to this subject here, but may probably resume it at another part of the book, if practical.

The reader who desires to understand the _principles_ of soup-making is advised to study with attention the directions for “Baron Liebeg’s Extract of Beef,” in the present chapter, and the receipt for _bouillon_ which follows it.

A FEW DIRECTIONS TO THE COOK.

In whatever vessel soup is boiled, see that it be perfectly clean, and let the inside of the cover and the rim be equally so. Wash the meat, and prepare the vegetables with great nicety before they are laid into it; and be careful to keep it always closely shut when it is on the fire. Never, on any account, set the soup by in it, but strain it off at once into a clean pan, and fill the stock-pot immediately with water; pursue the same plan with all stewpans and saucepans directly they are emptied.

Skim the soup thoroughly when it _first_ begins to boil, or it will not be easy afterwards to render it clear; throw in some salt, which will assist to bring the scum to the surface, and when it has all been taken off, add the herbs and vegetables; for if not long stewed in the soup, their flavour will prevail too strongly. Remember that the trimmings, and the _bones_ of fresh meat, the necks of poultry, the liquor in which a joint has been boiled, and the shank-bones of mutton, are all excellent additions to the stock-pot, and should be carefully reserved for it. The remains of roast poultry and game also will improve both the colour and the flavour of broth or soup.

Let the soup be very slowly heated, and after it has been well skimmed, and has boiled for a few minutes, draw it to the side of the stove and keep it _simmering softly_, but without ceasing, until it is done; for on this, as will hereafter be shown, its excellence principally depends. Every good cook understands perfectly the difference produced by the fast boiling, or the _gentle stewing_, of soups and gravies, and will adhere strictly to the latter method.[13]

Footnote 13:

It is most difficult to render rapidly-boiled soup or gravy clear for table; but that which is only simmered will clarify itself if allowed to remain undisturbed for some little time (half an hour or so) after it is withdrawn from the fire; it should then be poured very gently from the sediment. Calf’s feet stock likewise may be converted into transparent jelly with far greater facility when it has not been thickened by too quick boiling, by which so many preparations in our English kitchens are injured.

Pour boiling water, in small quantities at first, to the meat and vegetables of which the soup is to be made when they have been fried or browned; but otherwise, always add _cold_ water to the meat. Unless precise orders to the contrary have been given, onions, eschalots, and garlic, should be used for seasoning with great moderation; for not only are they very offensive to many eaters, but to persons of delicate habit their effects are sometimes extremely prejudicial; and it is only in coarse cookery that their flavour is allowed ever strongly to prevail.

A small proportion of sugar, about an ounce to the gallon, will very much improve the flavour of gravy-stock, and of all rich brown soups; it may be added also to some others with advantage; and for this, directions will be given in the proper places.

Two ounces of salt may be allowed for each gallon of soup or broth, in which large quantities of vegetables are stewed; but an ounce and a half will be sufficient for such as contain few or none; it is always easy to add more if needful, but oversalting in the first instance is a fault for which there is no remedy but that of increasing the proportions of all the other ingredients, and stewing the whole afresh, which occasions needless trouble and expense, even when time will admit of its being done.

As no particle of fat should be seen floating on soup when sent to table, it is desirable that the stock should be made the day before it is wanted, that it may become quite cold; when the fat may be entirely cleared off without difficulty.

When cayenne pepper is not mixed with rice-flour, or with any other thickening, grind it down with the back of a spoon, and stir a little liquid to it before it is thrown into the stewpan, as it is apt to remain in lumps, and to occasion great irritation of the throat when swallowed so.

Serve, not only soups and sauces, but all other dishes, _as hot as possible_.

THE TIME REQUIRED FOR BOILING DOWN SOUP OR STOCK.

This must be regulated by several considerations; for though the mere juices of meat require but little boiling after they have been fully extracted by the slow heating recommended by Baron Liebeg, soup to which many vegetables are added (winter vegetables especially) requires long stewing to soften and to blend properly the flavour of _all_ the ingredients which it contains, as that of no one in particular ought to be allowed to predominate over the rest. We have in consequence retained the old directions as to time, in many of the following receipts; but an intelligent cook will soon ascertain from practice and observation how and when to vary it with advantage. _Over-boiling_ renders all preparations insipid, and causes undue reduction of them likewise: it is a fault, therefore, which should be carefully avoided.

TO THICKEN SOUPS.

Except for white soups, to which arrow-root is, we think, more appropriate, we prefer, to all other ingredients generally used for this purpose, the finest and freshest rice-flour, which, after being passed through a lawn sieve, should be thoroughly blended with the salt, pounded spices, catsup, or wine, required to finish the flavouring of the soup. Sufficient liquid should be added to it very gradually to render it of the consistence of batter, and it should also be perfectly smooth; to keep it so, it should be moistened sparingly at first, and beaten with the back of a spoon until every lump has disappeared. The soup should boil quickly when the thickening is stirred into it, and be simmered for ten minutes afterwards. From an ounce and a half to two ounces of rice-flour will thicken sufficiently a quart of soup.

Instead of this, arrow-root or the condiment known by the name of _tous les mois_, which greatly resembles it, or potato flour, or the French thickening called _roux_ (see Chapter V.), may be used in the following proportions:—Two and a half ounces of either of the first three, to four pints and a half of soup; to be mixed gradually with a little cold stock or water, stirred into the boiling soup, and simmered for a minute.

Six ounces of flour with seven of butter, made into a _roux_, or merely mixed together with a large knife, will be required to thicken a tureen of soup; as much as half a pound is sometimes used; these must be added by degrees, and carefully stirred round in the soup until smoothly blended with it, or they will remain in lumps. We would, however, recommend any other thickening rather than this unwholesome mixture.

All the ingredients used for soups should be fresh, and of good quality, particularly Italian pastes of every kind (macaroni, vermicelli, &c.), as they contract, by long keeping, a peculiarly unpleasant, musty flavour.

Onions, freed from the outer skin, dried gradually to a deep brown, in a slow oven, and flattened like Norfolk biffins, will keep for almost any length of time, and are extremely useful for heightening the colour and flavour of broths and gravies.[14]

Footnote 14:

The fourth part of one these dried onions (_des ognons brûlés_), of moderate size, is sufficient for a tureen of soup. They are sold very commonly in France, and may be procured in London at many good foreign warehouses.

TO FRY BREAD TO SERVE WITH SOUP.

Cut some slices a quarter of an inch thick from a stale loaf; pare off the crust and divide the bread into dice, or cut it with a small paste-cutter into any other form. For half a pound of bread put two ounces of the best butter into a frying-pan, and when it is quite melted, add the bread; keep it turned over a gentle fire until it is equally coloured to a very pale brown, then drain it from the butter, and dry it on a soft cloth, or on a sheet of paper placed before a clear fire upon a dish, or upon a sieve reversed.

SIPPETS À LA REINE.

Having cut the bread as for common sippets, spread it on a dish, and pour over it a few spoonsful of thin cream, or of good milk: let it soak for an hour, then fry it in fresh butter of a delicate brown, drain and serve the sippets very hot.

TO MAKE NOUILLES.

(_An elegant substitute for Vermicelli._)

Wet with the yolks of four eggs, as much fine dry sifted flour as will make them into a firm but very smooth paste. Roll it out as thin as possible, and cut it into bands of about an inch and a quarter in width. Dust them lightly with flour, and place four of them one upon the other. Cut them obliquely into the finest possible strips; separate them with the point of a knife, and spread them upon writing paper, so that they may dry a little before they are used. Drop them gradually into the boiling soup, and in ten minutes they will be done.

Various other forms may be given to this paste at will. It may be divided into a sort of ribbon macaroni; or stamped with small confectionary cutters into different shapes. It is much used in the more delicate departments of cookery, and when cut as for soup, and prepared as for the _Genoises à la Reine_ of Chapter XVIII. makes very superior puddings, pastry, fritters, and other sweet dishes.

VEGETABLE VERMICELLI.

(_Vegetables cut very fine for soups._)

Cut the carrots into inch lengths, then pare them round and round in ribands of equal thickness, till the inside is reached; next cut these ribands into straws, or very small strips; celery is prepared in the same way, and turnips also are first pared into ribands, then sliced into strips; these last require less boiling than the carrots, and attention must be paid to this, for if broken, the whole would have a bad appearance in soup. The safer plan is to boil each vegetable separately, till tolerably tender, in a little pale broth (in water if this be not at hand), to drain them well, and put them into the soup, which should be clear, only a few minutes before it is dished. For cutting them small, in other forms, the proper instruments will be found at the ironmonger’s.

EXTRACT OF BEEF; OR, VERY STRONG PLAIN BEEF GRAVY SOUP.

(_Baron Liebeg’s Receipt._)

OBSERVATION.—This admirable preparation is not only most valuable as a restorative of the best kind for invalids who require light but highly nutritious diet, it is also of the utmost utility for the general purposes of the kitchen, and will enable a cook who can take skilful advantage of it, to convert the _cold meat_ which often abounds so inconveniently in an English larder, from our habit of having joints of large size so much served, into good nourishing dishes, which the hashes and minces of our common cookery _are not_, though they may answer well enough as mere varieties of diet. We shall indicate in the proper chapters the many other uses to which this _beef juice_—for such indeed it is—will be found eminently adapted. Of its value in illness it is impossible to speak too highly; and in every family, therefore, the _exact_ mode of making it ought to be thoroughly understood. The economist who may consider it expensive, must remember that drugs and medical advice are usually far more so; and in cases of extreme debility the benefit derived from it, when it is well prepared and judiciously administered, is often remarkable. It should be given in small quantities at first, and in its pure state. It may afterwards be varied by the addition of vermicelli, semoulina, or other preparations of the kind; and also by using for it a portion of mutton, calf’s head, poultry, or game, when these suit a patient as well as the beef.

RECEIPT.—Take a pound of good, juicy beef (rump-steak is best for the purpose), from which all the skin and fat that can possibly be separated from it, has been cut away. Chop it up small like sausage-meat; then mix it thoroughly with an exact pint of cold water, and place it on the side of the stove to heat _very slowly indeed_; and give it an occasional stir. It may stand two or three hours before it is allowed to simmer, and will then require at the utmost but fifteen minutes of gentle boiling. Professor Liebeg directs even

less time than this, but the soup then occasionally retains a raw flavour which is distasteful. Salt should be added when the boiling first commences, and for invalids, this, in general, is the only seasoning required. When the extract is thus far prepared, it may be poured from the meat into a basin, and allowed to stand until any particles of fat it may exhibit on the surface can be skimmed off entirely, and the sediment has subsided and left the soup quite clear (which it speedily becomes), when it may be poured gently off, heated in a clean saucepan, and served at once. It will contain all the nutriment which the meat will yield. The scum should always be well cleared from the surface of the soup as it accumulates.

To make light beef tea or broth, merely increase the proportion of water to a pint and a half or a quart; but in all else proceed as above.

Meat (without fat or skin), 1 lb.; cold water, exact pint: heating 2 hours or more; to boil 15 minutes at the utmost. Beef tea or broth.—Beef, 1 lb.; water, 1-1/2 pint or 1 quart.

Obs.—To mingle vegetable diet in its best form with this extract, it will be sufficient, as we have explained in “Cookery for Invalids,” to boil down the kind of vegetable desired, sliced or cut up small, in a very moderate quantity of water, until its juices are well drawn out; then to strain off the liquid from it with slight pressure, and, when it has become cold, to pour it to the chopped meat instead of water. Several different sorts can be mixed together, and cooked in this way: the water must boil before they are added to it.

They should be much more tender than when merely boiled for table, but not reduced to pulp. The juice should remain clear; no salt should be added; and it should be quite cold before it is stirred to the meat.

When the extract is wanted for gravy, a small portion of onion, and of herbs, carrots, celery, and the other usual vegetables, may be stewed together, to give it the requisite flavour.

About an inch square of the Jewish beef (see Chapter of FOREIGN COOKERY), whether cooked or uncooked, will impart a fine savour to it; the smoked surface of this should be pared off before it is used, and it may be added in thin slices.

BOUILLON.

(_The Common Soup or Beef-Broth of France; cheap, and very wholesome._)

[Illustration]

This soup, or _broth_ as we should perhaps designate it in England, is made once or twice in the week, in every family of respectability in France; and by the poorer classes as often as their means will enable them to substitute it for the vegetable or _maigre_ soups, on which they are more commonly obliged to subsist. It is served usually on the first day with slices of untoasted bread soaked in it; on the second, it is generally varied with vermicelli, rice, or semoulina. The ingredients are, of course, often otherwise proportioned than as we have given them, and more or less meat is allowed according to the taste or circumstances of the persons for whom the _bouillon_ is prepared; but the process of making it is always the same, and is thus described (rather learnedly) by one of the most skilful cooks in Europe: “The stock-pot of the French artisan,” says Monsieur Carême, “supplies his principal nourishment; and it is thus managed by his wife, who, without the slightest knowledge of chemistry, conducts the process in a truly scientific manner. She first lays the meat into an earthen stock-pot, and pours cold water to it in the proportion of about two quarts to three pounds of the beef;[15] she then places it by the side of the fire, where it slowly becomes hot; and as it does so, the heat enlarges the fibre of the meat, dissolves the gelatinous substances which it contains, allows the albumen (or the muscular part which produces the scum) to disengage itself, and rise to the surface, and the OZMAZOME (_which is the most savoury part of the meat_) to be diffused through the broth. Thus, from the simple circumstance of boiling it in the gentlest manner, a relishing and nutritious soup will be obtained, and a dish of tender and palatable meat; but if the pot be placed and kept over a quick fire, the _albumen_ will coagulate, harden the meat, prevent the water from penetrating it, and the _ozmazome_ from disengaging itself; the result will be a broth without flavour or goodness, and a tough, dry bit of meat.”

Footnote 15:

This is a large proportion of meat for the family of a French artisan, a pound to the quart would be nearer the reality; but it is not the refuse-meat which would be purchased by persons of the same rank in England for making broth.

It must be observed in addition, that as the meat of which the _bouillon_ is made, is almost invariably sent to table, a part of the rump, the mouse-buttock, or the leg-of-mutton piece of beef, should be selected for it; and the simmering should be continued only until this is perfectly tender. When the object is simply to make good, pure-flavoured, beef broth, part of the shin or leg, with a pound or two of the neck, will best answer the purpose. When the _bouilli_ (that is to say, the beef which is boiled in the soup), is to be served, bind it into a good shape, add to it a calf's foot if easily procurable, as this much improves the quality of the _bouillon_; pour cold water to it in the proportion mentioned above, and proceed, as Monsieur Carême directs, to heat the soup _slowly_ by the side of the fire; remove carefully the head of scum which will gather on the surface before the boiling commences, and continue the skimming at intervals for about twenty minutes longer, pouring in once or twice a little cold water. Next, add salt in the proportion of two ounces to the gallon; this will cause a little more scum to rise; clear it quite off and throw in three or four turnips, as many carrots, half ahead of celery, four or five young leeks, an onion stuck with six or eight cloves, a large half teaspoonful of peppercorns, and a bunch of savoury herbs. Let the whole stew VERY softly without ceasing, from four hours and a half to six hours, according to the quantity: the beef in that time will be extremely tender but not overdone. It will be excellent eating if properly managed, and might often, we think, be substituted with great advantage for the hard, half-boiled, salted beef so often seen at an English table. It should be served with a couple of cabbages, which have been first boiled in the usual way, then pressed very dry, and stewed for ten minutes in a little of the broth, and seasoned with pepper and salt. The other vegetables from the _bouillon_ may be laid round it or not at choice. The soup if served on the same day must be strained, well cleared from fat, and sent to table with fried or toasted bread, unless the continental mode of putting slices or crusts of _untoasted_ bread into the tureen, and soaking them for ten minutes in a ladleful or two of the _bouillon_, be, from custom, preferred.

Beef, 8 to 9 lbs.; water, 6 quarts; salt, 3 oz. (more, if needed); carrots, 4 to 6; turnips, 4 or 5; celery, one small head; leeks, 4 to 6; one onion, stuck with 6 cloves; peppercorns, one small teaspoonful; large bunch of savoury herbs (calf's foot if convenient); to _simmer_ 5 to 6 hours.

Obs. 1.—This broth forms in France the foundation of all richer soups and gravies. Poured on fresh meat (a portion of which should be veal) instead of water, it makes at once an excellent _consommé_ or strong jellied stock. If properly managed, it is very clear and pale; and with an additional weight of beef and some spoonsful of glaze, may easily be converted into an amber-coloured gravy-soup, suited to modern taste.

Obs. 2.—It is a common practice abroad to boil poultry, pigeons, and even game, in the _=pot-au-feu=_ or soup-pot.[16] They should be properly trussed, stewed in the broth just long enough to render them tender, and served, when ready, with a _=good=_ sauce. A small ham, if well soaked, washed exceedingly clean, and freed entirely from any rusty or blackened parts, laid with the beef when the water is first added to it, and boiled from three hours and a half to four hours in the _bouillon_, is very superior in flavour to those cooked in water only, and infinitely improves the soup, which cannot however so well be eaten until the following day, when all the fat can easily be taken from it: it would, of course, require no salt.

Footnote 16:

In wealthy families the soup is boiled in a metal soup-pot, called a _=marmite=_.

CLEAR, PALE GRAVY SOUP OR CONSOMMÉ.

Rub a deep stewpan or soup-pot with butter, and lay into it three quarters of a pound of ham freed entirely from fat, skin, and rust, four pounds of leg or neck of veal, and the same weight of lean beef, all cut into thick slices; set it over a clear and rather brisk fire, until the meat is of a fine amber-colour; it must be often moved, and closely watched, that it may not stick to the pan, nor burn. When it is equally browned, lay the bones upon it, and pour in gradually four quarts of boiling water. Take off the scum carefully as it rises, and throw in a pint of cold water at intervals to bring it quickly to the surface. When no more appears, add two ounces of salt, two onions, two large carrots, two turnips, one head of celery, a faggot of savoury herbs, a dozen cloves, half a teaspoonful of whole white pepper, and two large blades of mace. Let the soup boil gently from five hours and a half to six hours and a half; then strain it through a very clean fine cloth, laid in a hair sieve. When it is perfectly cold, remove every particle of fat from the top; and, in taking out the soup, leave the sediment untouched; heat in a clean pan the quantity required for table, add salt to it if needed, and a few drops of chili or of cayenne vinegar. Harvey's sauce, or very fine mushroom catsup, may be substituted for these. When thus prepared the soup is ready to serve: it should be accompanied by pale sippets of fried bread, or sippets _à la reine_. (At tables where English modes of service entirely prevailed, clear gravy-soup, until very recently, was always accompanied by dice, or sippets as they are called, of delicately toasted bread. These are now seldom seen, but some Italian paste, or nicely prepared

vegetable, is served _in_ the soup instead). Rice, macaroni in lengths or in rings, vermicelli, or _nouilles_, may in turn be used to vary it; but they must always be boiled apart, till tender, in broth or water, and well drained before they are slipped into it. The addition of young vegetables, too, and especially of asparagus, will convert it into superior spring-soup; but they, likewise, must be separately cooked.

ANOTHER RECEIPT FOR GRAVY SOUP.

Instead of browning the meat in its own juices, put it with the onions and carrots, into a deep stewpan, with a quarter of a pint of _bouillon_, set it over a brisk fire at first, and when the broth is somewhat reduced, let it boil gently until it has taken a fine colour, and forms a glaze (or jelly) at the bottom of the stewpan; then pour to it the proper quantity of water, and finish the soup by the preceding receipt.[17]

Footnote 17:

The juices of meat, drawn out with a small portion of liquid, as directed here, may easily be reduced to the consistency in which they form what is called _glaze_; for particulars of this, see Chapter IV. The best method, though perhaps not the easiest, of making the clear, amber-coloured stock, is to pour a ladleful or two of pale but strong beef-broth to the veal, and to boil it briskly until well reduced, thrusting a knife when this is done into the meat, to let the juices escape; then to proceed more slowly and cautiously as the liquid approaches the state in which it would burn. It must be allowed to take a dark amber-colour only, and the meat must be turned, and often moved in it. When the desired point is reached, pour in more boiling broth, and let the pan remain off the fire for a few minutes, to detach and melt the glaze; then shake it _well_ round before the boiling is continued. A certain quantity of deeply coloured glaze, made apart, and stirred into strong, clear, pale stock, would produce the desired effect of this, with much less trouble.

Obs.—A rich, old-fashioned English brown gravy-soup may be made with beef only. It should be cut from the bones, dredged with flour, seasoned with pepper and salt, and fried a clear brown; then stewed for six hours, if the quantity be large, with a pint of water to each pound of meat, and vegetables as above, except onions, of which four moderate-sized ones, also fried, are to be added to every three quarts of the soup, which, after it has been strained and cleared from fat, may be thickened with six ounces of fresh butter, worked up very smoothly with five of flour. In twenty minutes afterwards, a tablespoonful of the best soy, half a pint of sherry, and a little cayenne, may be added to the soup, which will then be ready to serve.

CHEAP, CLEAR GRAVY SOUP.

The shin or leg of beef, if not large or coarse, will answer extremely well for this soup, and afford at the same time a highly economical dish of boiled meat, which will be found very tender, and very _palatable_ also, if it be served with a sauce of some piquancy. From about ten pounds of the meat let the butcher cut evenly off five or six from the thick fleshy part, and again divide the knuckle, that the whole may lie compactly in the vessel in which it is to be stewed. Pour in three quarts of cold water, and when it has been brought slowly to boil, and been well skimmed, as directed for _bouillon_ (Page 8), throw in an ounce and a half of salt, half a large teaspoonful of peppercorns, eight cloves, two blades of mace, a faggot of savoury herbs, a couple of small carrots, and the heart of a root of celery; to these add a mild onion or not, at choice. When the whole has stewed very softly for four hours, probe the larger bit of beef, and if quite tender, lift it out for table; let the soup be simmered from two to three hours longer, and then strain it through a fine sieve, into a clean pan. When it is perfectly cold, clear off every particle of fat; heat a couple of quarts, stir in, when it boils, half an ounce of sugar, a small tablespoonful of good soy, and twice as much of Harvey's sauce, or instead of this, of clear and fine mushroom catsup. If carefully made, the soup will be perfectly transparent and of good colour and flavour. A thick slice of lean ham will improve it, and a pound or so of the neck of beef with an additional pint of water, will likewise enrich its quality. A small quantity of good broth may be made of the fragments of the whole boiled down with a few fresh vegetables.

Brown caper, or hot horseradish sauce, or _sauce Robert_, or _sauce piquante_, made with the liquor in which it is boiled, may be served with the portion of the meat which is sent to table.

VERMICELLI SOUP.

(_Potage au Vermicelle._)

Drop very lightly, and by degrees, six ounces of vermicelli, broken rather small, into three quarts of boiling bouillon or clear gravy soup; let it simmer for half an hour[18] over a gentle fire, and stir it often. This is the common French mode of making vermicelli

soup, and we can recommend it as a particularly good one for family use. In England it is customary to soak, or to blanch the vermicelli, then to drain it well, and to stew it for a shorter time in the soup; the quantity also, must be reduced quite two ounces, to suit modern taste.

Footnote 18:

When of very fine quality, the vermicelli will usually require less boiling than this. We have named to the reader, in another part of the volume, Mr. Cobbett, 18, Pall Mall, as supplying all the Italian pastes extremely good. There are, of course, _many_ other houses in London where they may be procured equally so; but in naming Mr. Cobbett, who is personally unknown to us, we merely give the result of our own experience of many years. Some articles of _very_ superior quality purchased for us at his warehouse by a person merely commissioned to procure the best that could be had "_from Town_," first directed our attention to his house (a long established one, we believe), which is justly noted, especially amongst affluent country families, for the excellence of the goods which it sends out. We give this explanation, because it seems invidious to select, from the large number of deservedly celebrated establishments of the same class which are to be found here, any _one_ in particular for mention in a work of this nature.

Bouillon, or gravy soup, 3 quarts; vermicelli, 6 oz.; 30 minutes. Or, soup, 3 quarts; vermicelli, 4 oz.; blanched in boiling water 5 minutes; stewed in soup 10 to 15 minutes.

SEMOULINA SOUP.

(_Soupe à la Sémoule._)

Semoulina is used in the same way as the vermicelli. It should be dropped very lightly and by degrees into the boiling soup, which should be stirred all the time it is being added, and very frequently afterwards; indeed, it should scarcely be quitted until it is ready for table. Skim it carefully, and let it simmer from twenty to five-and-twenty minutes. This, when the semoulina is good and fresh, is, to our taste, an excellent soup.

Soup, 3 quarts; semoulina, 6 oz.; nearly, or quite 25 minutes.

MACARONI SOUP.

Throw four ounces of fine fresh[19] mellow Naples maccaroni into a pan of fast-boiling water, with about an ounce of fresh butter, and a small onion stuck with three or four cloves.[20] When it has swelled to its full size, and become tender, drain it well, cut it into half-inch lengths, and slip it into a couple of quarts of clear gravy-soup: let it simmer for a few minutes, when it will be ready for table. Observe, that the macaroni should be boiled quite tender; but it should by no means be allowed to burst, nor to become pulpy. Serve grated Parmesan cheese with it.

Footnote 19:

We must here repeat our warning against the use of long-kept macaroni, vermicelli, or semoulina; as when stale they will render any dish into which they are introduced quite unfit for table.

Footnote 20:

For white soups omit the onion.

Macaroni, 4 oz.; butter, 1 oz.; 1 small onion; 5 cloves; 3/4 hour, or more. In soup, 5 to 10 minutes.

Obs.—The macaroni for soups should always be either broken into short lengths before it is boiled, or cut as above, or sliced quickly into small rings not more than the sixth of an inch thick after it is boiled, unless the _cut_ or ring macaroni, which may be purchased at the Italian warehouses, be used; this requires but ten minutes' boiling, and should be dropped into the soup in the same way as vermicelli.[21] Four ounces of it will be sufficient for two quarts of stock. It may be added to white soup after having been previously boiled in water or veal-broth, and well drained from it: it has a rather elegant appearance in clear gravy-soup, but should have a boil in water before it is thrown into it.

Footnote 21:

For the different varieties of macaroni and vermicelli, and the time required to boil each of them, see Chapter XXI.

If served in very clear bright stock (_consommé_), it should be boiled apart until tender in a little good broth, which ought also to be clear and entirely free from fat; then well drained, and put into the soup for a minute, or into the tureen, the instant before the soup is dished.

SOUP OF SOUJEE.

The soujee is of Indian origin, but is now well manufactured in England,[22] and is, we think, somewhat more delicate than semoulina in flavour; and being made from wheat of the finest quality, is also quite as nutritious, or more so. For each quart of soup allow two ounces of soujee (the proportions can always be otherwise adapted to the taste after the first trial); drop it gradually into the boiling liquid, and simmer it for ten or twelve minutes. Bullock's semola is another preparation which may be used in exactly the same manner to thicken soup; but both this and soujee are more expensive at present than semoulina.

Footnote 22:

By Messrs. Stephens and Co., 2 White's Row, Bishopsgate.

POTAGE AUX NOUILLES, OR TAILLERINE SOUP

Make into _nouille_-paste, with very fine dry flour, the yolks of four fresh eggs, and when ready cut, drop it gradually into five pints of boiling soup; keep this gently stirred for ten minutes, skim it well, and serve it quickly. This is a less common, and a more delicately flavoured soup than the vermicelli, provided always that the _nouilles_ be made with really fresh eggs. The same paste may be cut into very small diamonds, squares, stars, or any other form, then left to dry a little, and boiled in the soup until swollen to its full size, and tender.

Nouille-paste of four eggs; soup, 5 pints: 10 minutes.

SAGO SOUP.

Wash in several waters, and float off the dirt from six ounces of fine pearl sago; put it into three quarts of good cold gravy-stock; let it stew gently from half to three quarters of an hour, and stir it occasionally, that it may not burn nor stick to the stewpan. A quarter of an ounce more of sago to each pint of liquid, will thicken it to the consistence of peas-soup. It may be flavoured with half a wineglassful of Harvey's sauce, as much cayenne as it may need, the juice of half a lemon, an ounce of sugar, and two glasses of sherry; or these may be omitted, and good beef-broth may be substituted for the gravy-soup, for a simple family dinner, or for an invalid; or, again, it may be converted into inexpensive white soup by the addition of some cream smoothly mixed with a dessertspoonful of arrow-root, or of thick cream and new milk in equal portions. Veal broth would be the most appropriate for this, or it might be made with half veal and half mutton.

Sago, 6 oz.; soup, 3 quarts: 30 to 45 minutes.

TAPIOCA SOUP.

This is made in the same manner, and with the same proportions as the preceding soup, but it must be simmered from fifty to sixty minutes.

RICE SOUP.

In France, this soup is served well thickened with the rice, which is stewed in it for upwards of an hour and a half, and makes thus, even with the common _bouillon_ of the country, an excellent winter _potage_. Wipe in a dry cloth, eight ounces of the best rice; add it, in small portions, to four quarts of hot soup, of which the boiling should not be checked as it is thrown in. When a clear soup is wanted wash the rice, give it five minutes' boil in water, drain it well, throw it into as much boiling stock or well-flavoured broth as will keep it covered till done, and simmer it very softly until the grains are tender but still separate; drain it, drop it into the soup, and let it remain in it a few minutes before it is served, but without simmering. When stewed in the stock it may be put at once, after being drained, into the tureen, and the clear _consommé_ may be poured to it.

An easy English mode of making rice-soup is this: put the rice into plenty of cold water; when it boils throw in a small quantity of salt, let it simmer for ten minutes, drain it well, throw it into the boiling soup, and simmer it gently from ten to fifteen minutes longer.[23] An extra quantity of stock must be allowed for the reduction of this soup which is always considerable.

Footnote 23:

The Patna requires much less boiling than the Carolina.

WHITE RICE SOUP.

Throw four ounces of well-washed rice into boiling water, and in five minutes after pour it into a sieve, drain it well, and put it into a couple of quarts of good white boiling stock; let it stew until tender; season the soup with salt, cayenne, and pounded mace; stir to it three quarters of a pint of very rich cream, give it one boil, and serve it quickly.

Rice, 4 oz.: boiled 5 minutes. Soup, 2 quarts: 3/4 hour or more. Seasoning of salt, mace, and cayenne; cream, 3/4 pint: 1 minute.

RICE-FLOUR SOUP.

Mix to a smooth batter, with a little cold broth, eight ounces of fine rice-flour, and pour it into a couple of quarts of fast-boiling broth or gravy soup. Add to it a seasoning of mace and cayenne, with a little salt if needful. It will require but ten minutes' boiling. Soup, 2 quarts; rice-flour, 8 oz.: 10 minutes.

Obs.—Two dessertspoonsful of currie-powder, and the strained juice of half a moderate-sized lemon will greatly improve this soup: it may also be converted into a good common white soup (if it be made of veal stock), by the addition of three quarters of a pint of thick cream to the rice.

STOCK FOR WHITE SOUP.

Though a knuckle of veal is usually preferred for this stock, part of the neck will answer for it very well. Whichever joint be chosen, let it be thoroughly washed, once or twice divided, and laid into a delicately clean soup-pot, or well-tinned large stout iron saucepan, upon a pound of lean ham, freed entirely from skin and fat, and cut into thick slices; or, instead of this, one half a pound of the Jewish smoked beef, of which we have already spoken, and from which the smoked surface, and _all_ fat, must be carefully carved away.

Dutch or hung beef also will answer the same purpose, but similar precautions must be observed with regard to the smoked portions of either; as they would impart a very unpleasant flavour to any preparation. Should _very_ rich soup be wished for, pour in a pint only of cold water for each pound of meat, but otherwise a pint and a half may be allowed. When the soup has been thoroughly cleared from scum, which should be carefully taken off from the time of its first beginning to boil, throw in an ounce of salt to the gallon (more can be added afterwards if needed), two mild onions, a moderate-sized head of celery, two carrots, a small teaspoonful of whole white pepper, and two blades of mace; and let the soup stew very softly from five to six hours, if the quantity be large: it should simmer until the meat falls from the bones. The skin of a calf's head, a calf's foot, or an old fowl may always be added to this stock with good effect. Strain it into a clean deep pan, and keep it in a cool place till wanted for use.

Lean ham, 1 lb.; veal, 7 lbs; water, 4 to 6 quarts; salt, 1-1/2 oz. (more if needed); onions, 2; celery, 1 head; carrots, 2; peppercorns, 1 teaspoonful; mace, 2 blades: 5 to 6 hours.

MUTTON-STOCK FOR SOUPS.

Equal parts of beef and mutton, with the addition of a small portion of ham, or dried beef, make excellent stock, especially for winter-soups. The necks of fowls, the bones of an undressed calf's head, or of any uncooked joint, may be added to it with advantage. According to the quality of soup desired, pour from a pint to a pint and a half of cold water to each pound of meat; and after the liquor has been well skimmed, on its beginning to boil, throw in an ounce and a half of salt to the gallon, two small heads of celery, three mild middling-sized onions, three well-flavoured turnips, as many carrots, a faggot of thyme and parsley, half a teaspoonful of white peppercorns, twelve cloves, and a large blade of mace. Draw the soup-pot to the side of the fire, and boil the stock as gently as possible for about six hours; then strain, and set it by for use. Be particularly careful to clear it _entirely_ from fat before it is prepared for table. One third of beef or _veal_, with two of mutton, will make very good soup; or mutton only will answer the purpose quite well upon occasion.

Beef, 4 lbs.; mutton, 4 lbs. (or, beef or veal from 2 to 3 lbs.; mutton from 5 to 6 lbs.); water, 1 to 1-1/2 gallon; salt, 1-1/2 oz.; mild turnips, 1 lb.; onions, 6 oz.; carrots, 3/4 lb.; celery, 6 to 8 oz.; 1 bunch of herbs; peppercorns, 1/2 teaspoonful; cloves, 12; mace, 1 large blade: 6 hours.

Obs.—Salt should be used sparingly at first for stock in which any portion of ham is boiled; allowance should also be made for its reduction, in case of its being required for gravy.

MADEMOISELLE JENNY LIND'S SOUP.

(_Authentic Receipt_)

This receipt does not merely bear the name of "Mademoiselle Lind," but is in reality that of the soup which was constantly served to her, as it was prepared by her own cook. We are indebted for it to the kindness of the very poplar Swedish authoress, Miss Bremer, who received it direct from her accomplished countrywoman.[24]

Footnote 24:

We were informed by Miss Bremer that Mademoiselle Lind was in the habit of taking this soup before she sang, as she found the sago and eggs soothing to the chest, and beneficial to the voice.

The following proportions are for a tureen of this excellent _potage_:—

Wash a quarter of a pound of the best pearl sago until the water poured from it is clear; then stew it quite tender and very thick in water or thick broth (it will require nearly or quite a quart of liquid, which should be poured to it cold, and heated slowly): then mix gradually with it a pint of good boiling cream, and the yolks of four fresh eggs, and mingle the whole carefully with two quarts of strong veal or beef stock, which should always be kept ready boiling. Send the soup immediately to table.

THE LORD MAYOR'S SOUP.

Wash thoroughly two sets of moderate sized pigs' ears and feet from which the hair has been carefully removed; add to them five quarts of cold water, and stew them very gently with a faggot of savoury herbs, and one large onion stuck with a dozen cloves, for nearly four hours, when the ears may be lifted out; stew the feet for another hour, then take them up, strain the soup, and set it in a cool place that it may become cold enough for the fat to be quite cleared from it. Next, bone the ears and feet, cut the flesh down into dice, throw a clean folded cloth over it, and leave it so until the soup requires to be prepared for table; then strew upon it two tablespoonsful of savoury herbs minced small, half a saltspoonful of cayenne, a little white pepper, and some salt. Put into a large saucepan half a pound of good butter, and when it begins to simmer thicken it gradually with as much flour as it will absorb; keep these stirred over a very gentle fire for ten minutes or more, but do not allow them to take the slightest colour; pour the soup to them by degrees, letting it boil up after each portion is added; put in the meat, and half a pint of sherry; simmer the whole from three to five minutes; dish the soup, and slip into it two or three dozens of delicately fried forcemeat-balls. (See Chapter VIII.)

Pigs' feet, 8; ears, 4; water, 5 quarts; bunch savoury herbs; 1 large onion; cloves, 12: 3-1/2 to 4 hours, feet, 1 hour more. Butter, 1/2 lb.; flour, 6 oz.[25]: 10 to 12 minutes. Minced herbs, 2 tablespoonsful; cayenne and common pepper, each 1/2 saltspoonful; salt, 1/2 teaspoonful or more; sherry, 1/2 pint: 3 to 5 minutes. Forcemeat-balls, 2 to 3 dozens.

Footnote 25:

The safer plan for an inexperienced cook is to weigh the flour, and then to sprinkle it from a dredging-box into the butter.

Obs.—We have given this receipt with the slightest possible variation from the original, which we derived from a neighbourhood where the soup made by it was extremely popular. We have better adapted it to our own taste by the following alterations.

THE LORD MAYOR'S SOUP.

(_Author's Receipt._)

We prefer to have this soup made, in part, the evening before it is wanted. Add the same proportion of water to the ears and feet as in the preceding directions; skim it thoroughly when it first boils, and throw in a tablespoonful of salt, two onions of moderate size, a small head of celery, a bunch of herbs, two whole carrots, a small teaspoonful of white peppercorns, and a blade of mace. Stew these softly until the ears and feet are perfectly tender, and, after they are lifted out, let the liquor be kept _just simmering_ only, while they are being boned, that it may not be too much reduced. Put the bones back into it, and stew them as gently as possible for an hour; then strain the soup into a clean pan, and set it by until the morrow in a cool place. The flesh should be cut into dice while it is still warm, and covered with the cloth before it becomes _quite_ cold. To prepare the soup for table clear the stock from

fat and sediment, put it into a very clean stewpan, or deep saucepan, and stir to it when it boils, six ounces of the finest rice-flour smoothly mixed with a quarter of a teaspoonful of cayenne, three times as much of mace and salt, the strained juice of a lemon, three tablespoonsful of Harvey's sauce, and half a pint of good sherry or Madeira. Simmer the whole for six or eight minutes, add more salt if needed, stir the soup often, and skim it thoroughly; put in the meat and herbs, and after they have boiled gently for five minutes, dish the soup, add forcemeat-balls or not, at pleasure, and send it to table quickly.

Moderate-sized pigs' feet, 8; ears, 4; water, 5 quarts; salt, 1 tablespoonful; onions, 2; celery, 1 head; carrots, 2; bunch of herbs; peppercorns, 1 small teaspoonful; mace, 1 blade: 3-1/2 to 4-1/2 hours. Stock, 5 pints; rice-flour, 6 oz.; cayenne, 1/4 teaspoonful; mace and salt, each 3/4 of a teaspoonful; juice of 1 lemon; Harvey's sauce, 3 tablespoonsful; sherry or Madeira, 1/2 pint: 6 to 8 minutes. Savoury herbs, 2 tablespoonsful: 5 minutes.

Obs. 1.—Should the quantity of stock exceed five pints, an additional ounce or more of rice must be used, and the flavouring be altogether increased in proportion. Of the minced herbs, two-thirds should be parsley, and the remainder equal parts of lemon thyme and winter savoury, unless sweet basil should be at hand, when a teaspoonful of it may be substituted for half of the parsley. To some tastes a seasoning of sage would be acceptable; and a slice or two of lean ham will much improve the flavour of the soup.

Obs. 2.—Both this soup, and the preceding one, may be rendered very rich by substituting strong _bouillon_ (see page 8) or good veal broth for water, in making them.

COCOA-NUT SOUP.

Pare the dark rind from a very fresh cocoa-nut, and grate it down small on an exceedingly clean, bright grater; weigh it, and allow two ounces for each quart of soup. Simmer it gently for one hour in the stock, which should then be strained closely from it, and thickened for table.

Veal stock, gravy-soup, or broth, 5 pints; grated cocoa-nut, 5 oz., 1 hour. Flour of rice, 5 oz.; mace, 1/2 teaspoonful; little cayenne and salt; mixed with 1/4 pint of cream: 10 minutes.

Or: gravy-soup, or good beef broth, 5 pints: 1 hour. Rice flour, 5 oz.; soy and lemon-juice, each 1 tablespoonful; finely pounded sugar, 1 oz.; cayenne, 1/4 teaspoonful; sherry, 2 glassesful.

Obs.—When either cream or wine is objected to for these soups, a half-pint of the stock should be reserved to mix the thickening with.

CHESTNUT SOUP.

Strip the outer rind from some fine, sound Spanish chestnuts, throw them into a large pan of warm water, and as soon as it becomes too hot for the fingers to remain in it, take it from the fire, lift out the chestnuts, peel them quickly, and throw them into cold water as they are done; wipe, and weigh them; take three quarters of a pound for each quart of soup, cover them with good stock, and stew them gently for upwards of three quarters of an hour, or until they break when touched with a fork; drain, and pound them smoothly, or bruise them to a mash with a strong spoon, and rub them through a fine sieve reversed; mix with them by slow degrees the proper quantity of stock; add sufficient mace, cayenne, and salt to season the soup, and stir it often until it boils. Three quarters of a pint of rich cream, or even less, will greatly improve it. The stock in which the chestnuts are boiled can be used for the soup when its sweetness is not objected to; or it may in part be added to it.

Chestnuts, 1-1/2 lb.: stewed from 2/3 to 1 hour. Soup, 2 quarts; seasoning of salt, mace, and cayenne: 1 to 3 minutes. Cream, 3/4 pint (when used).

JERUSALEM ARTICHOKE, OR PALESTINE SOUP.

Wash and pare quickly some freshly-dug artichokes, and to preserve their colour, throw them into spring water as they are done, but do not let them remain in it after all are ready. Boil three pounds of them in water for ten minutes; lift them out, and slice them into three pints of boiling stock; when they have stewed gently in this from fifteen to twenty minutes, press them with the soup, through a fine sieve, and put the whole into a clean saucepan with a pint and a half more of stock; add sufficient salt and cayenne to season it, skim it well, and after it has simmered for two or three minutes, stir it to a pint of rich boiling cream. Serve it immediately.

Artichokes, 3 lbs., boiled in water: 10 minutes. Veal stock, 3 pints 15 to 20 minutes. Additional stock, 1-1/2 pint; little cayenne and salt 2 to 3 minutes. Boiling cream, 1 pint.

Obs.—The palest veal stock, as for white soup, should be used for this; but for a family dinner, or where economy is a consideration excellent mutton-broth, made the day before and perfectly cleared from fat, will answer very well as a substitute; milk too may in part take the place of cream when this last is scarce: the proportion of artichokes should then be increased a little.

Vegetable-marrow, when young, makes a superior soup even to this, which is an excellent one. It should be well pared, trimmed, and sliced into a small quantity of boiling veal stock or broth, and when perfectly tender, pressed through a fine sieve, and mixed with more stock and some cream. In France the marrow is stewed, first in butter, with a large mild onion or two also sliced; and afterwards in a quart or more of water, which is poured gradually to it; it is next passed through a tammy,[26] seasoned with pepper and salt, and mixed with a pint or two of milk and a little cream.

Footnote 26:

Derived from the French _tamis_, which means a sieve or strainer.

COMMON CARROT SOUP.

The most easy method of making this favourite English soup is to boil some highly coloured carrots quite tender in water slightly salted, then to pound or mash them to a smooth paste, and to mix with them boiling gravy soup or strong beef broth (_see Bouillon_) in the proportion of two quarts to a pound and a half of the prepared carrots; then to pass the whole through a strainer, to season it with salt and cayenne, to heat it in a clean stewpan, and to serve it immediately. If only the red outsides of the carrots be used, the colour of the soup will be very bright; they should be weighed after they are mashed. Turnip soup may be prepared in the same manner.

Obs.—An experienced and observant cook will know the proportion of vegetables required to thicken this soup appropriately, without having recourse to weights and measures; but the learner had always better proceed by _rule_.

Soup, 2 quarts; pounded carrot, 1-1/2 lb.; salt, cayenne: 5 minutes.

A FINER CARROT SOUP.

Scrape very clean, and cut away all blemishes from some highly-flavoured red carrots; wash, and wipe them dry, and cut them into quarter-inch slices. Put into a large stewpan three ounces of the best butter, and when it is melted, add two pounds of the sliced carrots, and let them stew gently for an hour without browning; pour to them then four pints and a half of brown gravy soup, and when they have simmered from fifty minutes to an hour, they ought to be sufficiently tender. Press them through a sieve or strainer with the soup; add salt, and cayenne if required; boil the whole gently for five minutes, take off all the scum, and serve the soup as hot as possible.

Butter, 3 oz.; carrots, 2 lbs.: 1 hour. Soup, 4-1/2 pints: 50 to 60 minutes. Salt, cayenne: 5 minutes.

COMMON TURNIP SOUP.

Wash and wipe the turnips, pare and weigh them; allow a pound and a half for every quart of soup. Cut them in slices about a quarter of an inch thick. Melt four ounces of butter in a clean stewpan, and put in the turnips before it begins to boil; stew them gently for three quarters of an hour, taking care that they shall not brown, then have the proper quantity of soup ready boiling, pour it to them, and let them simmer in it for three quarters of an hour. Pulp the whole through a coarse sieve or soup strainer, put it again on the fire, keep it stirred until it has boiled three minutes or four, take off the scum, add salt and pepper if required, and serve it very hot. Turnips, 3 lbs.; butter, 4 oz.: 3/4 hour. Soup, 2 quarts: 3/4 hour. Last time: three minutes.

A QUICKLY MADE TURNIP SOUP.

Pare and slice into three pints of veal or mutton stock or of good broth, three pounds of young mild turnips; stew them gently from twenty-five to thirty minutes, or until they can be reduced quite to pulp; rub the whole through a sieve, and add to it another quart of stock, a seasoning of salt and white pepper, and one lump of sugar: give it two or three minutes' boil, skim and serve it. A large white onion when the flavour is liked may be sliced and stewed with the turnips. A little cream improves much the colour of this

soup.

Turnips, 3 lbs.; soup, 5 pints: 25 to 30 minutes.

POTATO SOUP.

Mash to a smooth paste three pounds of good mealy potatoes, which have been steamed, or boiled very dry; mix with them by degrees, two quarts of boiling broth, pass the soup through a strainer, set it again on the fire, add pepper and salt, and let it boil for five minutes. Take off entirely the black scum that will rise upon it, and serve it very hot with fried or toasted bread. Where the flavour is approved, two ounces of onions minced and fried a light brown, may be added to the soup, and stewed in it for ten minutes before it is sent to table.

Potatoes, 3 lbs.; broth, 2 quarts: 5 minutes. (With onions, 2 oz.) 10 minutes.

APPLE SOUP.

(_Soupe à la Bourguignon._)

Clear the fat from five pints of good mutton broth, _bouillon_, or shin of beef stock, and strain it through a fine sieve; add to it when it boils, a pound and a half of good cooking apples, and stew them down in it very softly to a smooth pulp; press the whole through a strainer, add a small teaspoonful of powdered ginger and plenty of pepper, simmer the soup for a couple of minutes, skim, and serve it very hot, accompanied by a dish of rice, boiled as for curries.

Broth, 5 pints; apples, 1-1/2 lb.: 25 to 40 minutes. Ginger, 1 teaspoonful; pepper, 1/2 teaspoonful: 2 minutes.

PARSNEP SOUP.

Dissolve, over a gentle fire, four ounces of good butter, in a wide stewpan or saucepan, and slice in directly two pounds of sweet tender parsneps; let them stew very gently until all are quite soft, then pour in gradually sufficient veal stock or good broth to cover them, and boil the whole slowly from twenty minutes to half an hour; work it with a wooden spoon through a fine sieve, add as much stock as will make two quarts in all, season the soup with salt and white pepper or cayenne, give it one boil, skim, and serve it very hot. Send pale fried sippets to table with it.

Butter, 4-1/2 oz.; parsneps, 2 lbs.: 3/4 hour, or more. Stock, 1 quart; 20 to 30 minutes; 1 full quart more of stock; pepper, salt: 1 minute.

Obs.—We can particularly recommend this soup to those who like the peculiar flavour of the vegetable.

ANOTHER PARSNEP SOUP.

Slice into five pints of boiling veal stock or strong colourless broth, a couple of pounds of parsneps, and stew them as gently as possible from thirty minutes to an hour; when they are perfectly tender, press them through a sieve, strain the soup to them, season, boil, and serve it very hot. With the addition of cream, parsnep soup made by this receipt resembles in appearance the Palestine soup.

Veal stock or broth, 5 pints; parsneps, 2 lbs.: 30 to 60 minutes. Salt and cayenne: 2 minutes.

WESTERFIELD WHITE SOUP.

Break the bone of a knuckle of veal in one or two places, and put it on to stew, with three quarts of cold water to the five pounds of meat; when it has been quite cleared from scum, add to it an ounce and a half of salt, and one mild onion, twenty corns of white pepper, and two or three blades of mace, with a _little_ cayenne pepper. When the soup is reduced one-third by slow simmering strain it off, and set it by till cold; then free it carefully from the fat and sediment, and heat it again in a very clean stewpan. Mix with it when it boils, a pint of thick cream smoothly blended with an ounce of good arrow-root, two ounces of very fresh vermicelli previously boiled tender in water slightly salted and _well drained_ from it, and an ounce and a half of almonds blanched and cut in strips: give it one minute’s simmer, and serve it immediately, with a French roll in the tureen.

Veal, 5 lbs.; water, 3 quarts; salt, 1-1/2 oz.; 1 mild onion; 20 corns white pepper; 2 large blades of mace: 5 hours or _more_. Cream, 1 pint; almonds, 1-1/2 oz.; vermicelli, 1 oz.: 1 minute. Little thickening if needed.

Obs.—We have given this receipt without any variation from the original, as the soup made by it—of which we have often partaken—seemed always much approved by the guests of the hospitable country gentleman from whose family it was derived, and at whose well-arranged table it was very commonly served; but we would suggest the suppression of the almond spikes, as they seem unsuited to the preparation, and also to the taste of the present day.

A RICHER WHITE SOUP.

Pound very fine indeed six ounces of sweet almonds, then add to them six ounces of the breasts of roasted chickens or partridges, and three ounces of the whitest bread which has been soaked in a little veal broth, and squeezed very dry in a cloth. Beat these altogether to an extremely smooth paste; then pour to them boiling and by degrees, two quarts of rich veal stock; strain the soup through a fine hair sieve, set it again over the fire, add to it a pint of thick cream, and serve it, as soon as it is at the point of boiling. When cream is very scarce, or not easily to be procured, this soup may be thickened sufficiently without it, by increasing the quantity of almonds to eight or ten ounces, and pouring to them, after they have been reduced to the finest paste, a pint of boiling stock, which must be again wrung from them through a coarse cloth with very strong pressure: the proportion of meat and bread also should then be nearly doubled. The stock should be well seasoned with mace and cayenne before it is added to the other ingredients.

Almonds, 6 oz.; breasts of chickens or partridges, 6 oz.; soaked bread, 3 oz.; veal stock, 2 quarts; cream, 1 pint.

Obs. 1.—Some persons pound the yolks of four or five hard-boiled eggs with the almonds, meat, and bread for this white soup; French cooks beat smoothly with them an ounce or two of whole rice, previously boiled from fifteen to twenty minutes.

Obs. 2.—A good plain white soup maybe made simply by adding to a couple of quarts of pale veal stock or strong well-flavoured veal broth, a thickening of arrow-root, and from half to three quarters of a pint of cream. Four ounces of macaroni boiled tender and well-drained may be dropped into it a minute or two before it is dished, but the thickening may then be diminished a little.

MOCK TURTLE SOUP.

To make a single tureen of this favourite English soup in the most economical manner when there is no stock at hand, stew gently down in a gallon of water four pounds of the fleshy part of the shin of beef, or of the neck, with two or three carrots, one onion, a small head of celery, a bunch of savoury herbs, a blade of mace, a half-teaspoonful of peppercorns, and an ounce of salt. When the meat is quite in fragments, strain off the broth, and pour it when cold upon three pounds of the knuckle or of the neck of veal; simmer this until the flesh has quite fallen from the bones, but be careful to stew it as softly as possible, or the quantity of stock will be so much reduced as to be insufficient for the soup. Next, take the half of a fine calf's head _with the skin on_, remove the brains, and then bone it[27] entirely, or let the butcher do this, and return the bones with it; these, when there is time, may be stewed with the veal to enrich the stock, or boiled afterwards with the head and tongue. Strain the soup through a hair-sieve into a clean pan, and let it drain closely from the meat. When it is nearly or quite cold, clear off all the fat from it; roll the head lightly round, leaving the tongue inside, or taking it out, as is most convenient, secure it with tape or twine, pour the soup over, and bring it gently to boil upon a moderate fire; keep it well skimmed, and simmer it from an hour to an hour and a quarter; then lift the head into a deep pan or tureen, add the soup to it, and let it remain in until nearly cold, as this will prevent the edges from becoming dark. Cut into quarter-inch slices, and then divide into dice, from six to eight ounces of the lean of an undressed ham, and if possible, one of good flavour; free it perfectly from fat, rind, and the smoked edges; peel and slice four moderate-sized eschalots, or if these should not be at hand, one mild onion in lieu of them. Dissolve in a well-tinned stewpan or thick iron saucepan which holds a gallon or more, four ounces of butter; put in the ham and eschalots, or onion, with half a dozen cloves, two middling-sized blades of mace, a half-teaspoonful of peppercorns, three or four very small sprigs of thyme, three teaspoonsful of minced parsley, one of lemon thyme and winter savoury mixed, and when the flavour is thought appropriate, the very thin rind of half a small fresh lemon. Stew these as softly as possible for nearly or quite an hour, and keep the pan frequently shaken: then put into a dredging box two ounces of fine dry flour, and sprinkle it to them by degrees; mix the whole well together, and after a few minutes more of gentle simmering, add very gradually five full pints of the stock taken free of fat and sediment, and made boiling before it is poured in; shake the pan strongly round as the first portions of it are added, and continue to do so until it contains from two to three pints, when the remainder may be poured in at once, and the pan placed by the side of the fire that it may boil in the gentlest manner for an hour. At

the end of that time turn the whole into a hair-sieve placed over a large pan, and if the liquid should not run through freely, knock the sides of the sieve, but do not force it through with a spoon, as that would spoil the appearance of the stock. The head in the meanwhile should have been cut up, ready to add to it. For the finest kind of mock turtle, only the skin, with the fat that adheres to it, should be used; and this, with the tongue, should be cut down into one inch squares, or if preferred into strips of an inch wide. For ordinary occasions, the lean part of the flesh may be added also, but as it is always sooner done than the skin, it is better to add it to the soup a little later. When it is quite ready, put it with the strained stock into a clean pan, and simmer it from three quarters of an hour to a full hour: it should be perfectly tender, without being allowed to break. Cayenne, if needed, should be thrown into the stock before it is strained; salt should be used sparingly, on account of the ham, until the whole of the other ingredients have been mixed together, when a sufficient quantity must be stirred into the soup to season it properly. A couple of glasses of good sherry or Madeira, with a dessertspoonful of strained lemon-juice, are usually added two or three minutes only before the soup is dished, that the spirit and flavour of the wine may not have time to evaporate; but it is sometimes preferred mellowed down by longer boiling. The proportion of lemon-juice may be doubled at will, but much acid is not generally liked. We can assure the reader of the excellence of the soup made by this receipt; it is equally palatable and delicate, and not heavy or cloying to the stomach, like many of the elaborate compositions which bear its name. The fat, through the whole process, should be carefully skimmed off. The ham gives far more savour, when used as we have directed, than when, even in much larger proportion, it is boiled down in the stock. Two dozens of forcemeat-balls, prepared by the receipt No. 11, Chap. VIII., should be dropped into the soup when it is ready for table. It is no longer customary to serve egg-balls in it.

Footnote 27:

This is so simple and easy a process, that the cook may readily accomplish it with very little attention. Let her only work the knife close to the bone always, so as to take the flesh clean from it, instead of leaving large fragments on. The jaw-bone may first be removed, and the flesh turned back from the edge of the other.

First broth:—shin, or neck of beef, 4 lbs.; water, 4 quarts; carrots, 2 or 3; large mild onion, 1; celery, small head; bunch savoury herbs; mace, 1 large blade; peppercorns, 1/2 teaspoonful; cloves, 6; salt, 1 oz.: 5 hours or more, _very gently_. For stock: the broth and 3 lbs. neck or knuckle of veal (bones of head if ready): 4 to 5 hours. Boned half-head with skin on and tongue, 1 to 1-1/4 hour. Lean of undressed ham, 6 to 8 oz. (6 if _very_ salt); shalots, 4, or onion, 1; fresh butter, 4 oz.; cloves, 6; middling-sized blades of mace, 2; peppercorns, 1/2 teaspoonful; _small_ sprigs of thyme, 3 or 4; minced parsley, 3 large teaspoonsful; minced savoury and lemon-thyme mixed, 1 small teaspoonful (thin rind 1/2 small lemon, when liked): 1 hour. Flour, 2 oz.: 5 minutes. Stock, full five pints; flesh of head and tongue, 1-3/4 to 2 lbs.: 3/4 of an hour to 1 hour (salt, if needed, to be added in interim). Good sherry or Madeira, 2 wineglassesful; lemon-juice, 1 to 2 dessertspoonsful; forcemeat-balls, 24.

Obs. 1.—The beef, veal, bones of the head, and vegetables may be stewed down together when more convenient: it is only necessary that a really good, well flavoured, and rather deeply-coloured stock should be prepared. A calf’s foot is always an advantageous addition to it, and the skin of another calf’s head[28] a better one still.

Footnote 28:

Country butchers, in preparing a calf’s head for sale in the ordinary way, take off the skin (or scalp), considered so essential to the excellence of this soup, and frequently throw it away; it may, therefore, often be procured from them at very slight cost, and is the best possible addition to the mock turtle. It is cleared from the head in detached portions with the hair on, but this may easily be removed after a few minutes’ scalding as from the head itself, or the feet, by the direction given in Chapter of _Sweet Dishes_. In London it is sold entire, and very nicely prepared, and may be served in many forms, besides being _added_ to soup with great advantage.

Obs. 2.—A couple of dozens mushroom-buttons, cleaned with salt and flannel, then wiped very dry, and sliced, and added to the ham and herbs when they have been simmered together about half an hour, will be found an improvement to the soup.

Claret is sometimes added instead of sherry or Madeira, but we do not think it would in general suit English taste so well. From two to three tablespoonsful of Harvey’s sauce can be stirred in with the wine when it is liked, or when the colour requires deepening.

OLD-FASHIONED MOCK TURTLE.

After having taken out the brain and washed and soaked the head well, pour to it nine quarts of cold water, bring it gently to boil, skim it very clean, boil it if large an hour and a half, lift it out, and put into the liquor eight pounds of neck of beef lightly browned in a

little fresh butter, with three or four thick slices of lean ham, four large onions sliced, three heads of celery, three large carrots, a large bunch of savoury herbs, the rind of a lemon pared very thin, a dessertspoonful of peppercorns, two ounces of salt, and after the meat has been taken from the head, all the bones and fragments. Stew these gently from six to seven hours, then strain off the stock and set it into a very cool place, that the fat may become firm enough on the top to be cleared off easily. The skin and fat of the head should be taken off together and divided into strips of two or three inches in length, and one in width; the tongue may be carved in the same manner, or into dice. Put the stock, of which there ought to be between four and five quarts, into a large soup or stewpot; thicken it when it boils with four ounces of fresh butter[29] mixed with an equal weight of fine dry flour, a half-teaspoonful of pounded mace, and a third as much of cayenne (it is better to use these sparingly at first, and to add more should the soup require it, after it has boiled some little time); pour in half a pint of sherry, stir the whole together until it has simmered for a minute or two, then put in the head, and let it stew gently from an hour and a quarter to an hour and a half: stir it often, and clear it perfectly from scum. Put into it just before it is ready for table three dozens of small forcemeat-balls; the brain cut into dice (after having been well soaked, scalded,[30] and freed from the film), dipped into beaten yolk of egg, then into the finest crumbs mixed with salt, white pepper, a little grated nutmeg, fine lemon-rind, and chopped parsley fried a fine brown, well drained and dried; and as many egg-balls, the size of a small marble, as the yolks of four eggs will supply. (See Chapter VIII). This quantity will be sufficient for two large tureens of soup; when the whole is not wanted for table at the same time, it is better to add wine only to so much as will be required for immediate consumption, or if it cannot conveniently be divided, to heat the wine in a small saucepan with a little of the soup, to turn it into the tureen, and then to mix it with the remainder by stirring the whole gently after the tureen is filled. Some persons simply put in the cold wine just before the soup is dished, but this is not so well.

Footnote 29:

When the butter is considered objectionable, the flour, without it, may be mixed to the smoothest batter possible, with a little cold stock or water, and stirred briskly into the boiling soup: the spices should be blended with it.

Footnote 30:

The brain should be blanched, that is, thrown into boiling water with a little salt in it, and boiled from five to eight minutes, then lifted out and laid into cold water for a quarter of an hour: it must be wiped very dry before it is fried.

Whole calf’s head with skin on, boiled 1-1/2 hour. Stock: neck of beef, browned in butter, 8 lbs.; lean of ham, 1/2 to 3/4 lb.; onions, 4; large carrots, 3; heads of celery, 3; large bunch herbs; salt, 2 oz. (as much more to be added when the soup is made as will season it sufficiently); thin rind, 1 lemon; peppercorns, 1 dessertspoonful; bones and trimmings of head: 8 hours. Soup: stock, 4 to 5 quarts; flour and butter for thickening, of each 4 oz.; pounded mace, half-teaspoonful; cayenne, third as much (more of each as needed); sherry, half pint: 2 to 3 minutes. Flesh of head and tongue, nearly or quite 2 lbs.: 1-1/4 to 1-1/2 hour. Forcemeat-balls, 36; the brain cut and fried; egg-balls, 16 to 24.

Obs.—When the brain is not blanched it must be cut thinner in the form of small cakes, or it will not be done through by the time it has taken enough colour: it may be altogether omitted without much detriment to the soup, and will make an excellent corner dish if gently stewed in white gravy for half an hour, and served with it thickened with cream and arrow-root to the consistency of good white sauce, then rather highly seasoned, and mixed with plenty of minced parsley, and some lemon-juice.

GOOD CALF’S HEAD SOUP.

(_Not expensive._)

Stew down from six to seven pounds of the thick part of a shin of beef with a little lean ham, or a slice of hung beef, or of Jewish beef, trimmed free from the smoky edges, in five quarts of water until reduced nearly half, with the addition, when it first begins to boil, of an ounce of salt, a large bunch of savoury herbs, one large onion, a head of celery, three carrots, two or three turnips, two small blades of mace, eight or ten cloves, and a few white or black peppercorns. Let it boil _gently_ that it may not be too much reduced, for six or seven hours, then strain it into a clean pan and set it by for use. Take out the bone from half a calf’s head with the skin on (the butcher will do this if desired), wash, roll, and bind it with a bit of tape or twine, and lay it into a stewpan, with the bones and tongue; cover the whole with the beef stock, and stew it for an hour and a half; then lift it into a deep earthen pan and let it cool in the liquor, as this will prevent the edges from becoming dry or discoloured. Take it out before it is quite cold; strain, and skim all the fat carefully from the stock; and heat five pints in a large clean saucepan, with the head cut into small thick slices or into inch-squares. As quite the whole will not be needed, leave a portion of the fat, but add every morsel of the skin to the soup, and of

the tongue also. Should the first of these not be perfectly tender, it must be simmered gently till it is so; then stir into the soup from six to eight ounces of fine rice-flour mixed with a quarter-teaspoonful of cayenne, twice as much freshly pounded mace, half a wineglassful of mushroom catsup,[31] and sufficient cold broth or water to render it of the consistence of batter; boil the whole from eight to ten minutes; take off the scum, and throw in two glasses of sherry; dish the soup and put into the tureen some delicately and well fried forcemeat-balls made by the receipt No. 1, 2, or 3, of Chapter VIII. A small quantity of lemon-juice or other acid can be added at pleasure. The wine and forcemeat-balls may be omitted, and the other seasonings of the soup a little heightened. As much salt as may be required should be added to the stock when the head first begins to boil in it: the cook must regulate also by the taste the exact proportion of cayenne, mace, and catsup, which will flavour the soup agreeably. The fragments of the head, with the bones and the residue of the beef used for stock, if stewed down together with some water and a few fresh vegetables, will afford some excellent broth, such as would be highly acceptable, especially if well thickened with rice, to many a poor family during the winter months.

Footnote 31:

Unless _very good_ and pure in flavour, we cannot recommend the addition of this or of any other catsup to soup or gravy.

Stock: shin of beef, 6 to 7 lbs.; water, 5 quarts: stewed down (with vegetables, &c.) till reduced nearly half. Boned half-head with skin on stewed in stock: 1-1/2 hour. Soup: stock, 5 pints; tongue, skin of head, and part of flesh: 15 to 40 minutes, or more if not quite tender. Rice-flour, 6 to 8 oz.; cayenne, quarter-teaspoonful; mace, twice as much; mushroom catsup, 1/2 wineglassful: 10 minutes. Sherry, 2 wineglassesful, forcemeat-balls, 20 to 30.

SOUP DES GALLES.

Add to the liquor in which a knuckle of veal has been boiled the usual time for table as much water as will make altogether six quarts, and stew in it gently sixpennyworth of beef bones and sixpennyworth of pork-rinds. When the boiling is somewhat advanced, throw in the skin of a calf's head; and in an hour afterwards, or when it is quite tender, lift it out and set it aside till wanted. Slice and fry four large mild onions, stick into another eight or ten cloves, and put them into the soup after it has stewed from six to seven hours. Continue the boiling for two or three hours longer, then strain off the soup, and let it remain until perfectly cold. When wanted for table, take it quite clear from the fat and sediment, and heat it anew with the skin of the calf's head cut into dice, three ounces of loaf sugar, four tablespoonsful of strained lemon-juice, two of soy, and three wineglassesful of sherry; give it one boil, skim it well, and serve it as hot as possible. Salt must be added to it sparingly in the first instance on account of the soy: a proper seasoning of cayenne or pepper must not, of course, be omitted.

This receipt was given to the writer, some years since, as a perfectly successful imitation of a soup which was then, and is still, she believes, selling in London at six shillings the quart. Never having tasted the original _Soupe des Galles_ she cannot say how far it is a correct one; but she had it tested with great exactness when she received it first, and found the result a very good soup prepared at an extremely moderate cost. The pork-rinds, when long boiled, afford a strong and flavourless jelly, which might be advantageously used to give consistence to other soups. They may be procured during the winter, usually at the butcher's, but if not, at the porkshops: they should be carefully washed before they are put into the soup-pot. When a knuckle of veal cannot conveniently be had, a pound or two of the neck and a morsel of scrag of mutton may instead be boiled down with the beef-bones; or two or three pounds of neck or shin of beef: but these will, of course, augment the cost of the soup.

POTAGE À LA REINE.

(_A Delicate White Soup._)

Should there be no strong veal broth, nor any white stock in readiness, stew four pounds of the scrag or knuckle of veal, with a thick slice or two of lean ham, a faggot of sweet herbs, two moderate-sized carrots, and the same of onions, a large blade of mace, and a half-teaspoonful of white peppercorns, in four quarts of water until reduced to about five pints; then strain the liquor, and set it by until the fat can be taken entirely from it. Skin and wash thoroughly, a couple of fine fowls, or three young pullets, and take away the dark spongy substance which adheres to the insides; pour the veal broth to them, and boil them gently from three quarters of an hour to an hour; then lift them out, take off all the white flesh, mince it small, pound it to the finest paste, and cover it with a basin until wanted for use. In the mean time let the bodies of the fowls be put again into the stock, and stewed gently for an hour and a half; add as much salt and cayenne, as will season the soup properly, strain it off when sufficiently boiled, and let it cool; skim off every particle of fat; steep, in a small portion of it, which should be boiling, four ounces of the crumb of light stale bread sliced thin,

and when it has simmered a few minutes, drain or wring the moisture from it in a clean cloth, add it to the flesh of the chickens, and pound them together until they are perfectly blended; then pour the stock to them in very small quantities at first, and mix them smoothly with it; pass the whole through a sieve or tammy, heat it in a clean stewpan, stir to it from a pint to a pint and a half of boiling cream, and add, should it not be sufficiently thick, an ounce and a half of arrow-root, quite free from lumps, and moistened with a few spoonsful of cold milk or stock.

REMARK.—This soup, and the two which immediately follow it, if made with care and great nicety by the exact directions given here for them, will be found very refined and excellent. For stock: veal, 4 lbs.; ham, 6 oz.; water, 4 quarts; bunch of herbs; carrots, 2; onions, 2; mace, large blade; peppercorns, 1/2 teaspoonful; salt: 5 hours. Fowls, 2, or pullets, 3: 3/4 to 1 hour; stewed afterwards 1 to 1-1/2 hour. Crumb of bread, 4 oz.; cream, 1 to 1-1/2 pint; arrow-root (if needed), 1-1/2 oz.

Obs.—Some cooks pound with the bread and chickens the yolks of three or four hard-boiled eggs, but these improve neither the colour nor the flavour of the _potage_.

WHITE OYSTER SOUP.

(_or Oyster Soup à la Reine._)

When the oysters are small, from two to three dozens for each pint of soup should be prepared, but this number can of course be diminished or increased at pleasure. Let the fish (which should be finely conditioned natives) be opened carefully; pour the liquor from them, and strain it; rinse them in it well, and beard them; strain the liquor a second time through a lawn sieve or folded muslin, and pour it again over the oysters. Take a portion from two quarts of the palest veal stock, and simmer the beards in it from twenty to thirty minutes. Heat the soup, flavour it with mace and cayenne, and strain the stock from the oyster-beards into it. Plump the fish in their own liquor, but do not let them boil; pour the liquor to the soup, and add to it a pint of boiling cream; put the oysters into the tureen, dish the soup, and send it to table quickly. Should any thickening be required, stir briskly to the stock an ounce and a half of arrow-root entirely free from lumps, and carefully mixed with a little milk or cream; or, in lieu of this, when a _rich_ soup is liked, thicken it with four ounces of fresh butter well blended with three of flour.

Oysters, 8 to 12 dozens; pale veal stock, 2 quarts; cream, 1 pint; thickening, 1 oz. arrow-root, or butter, 4 oz., flour, 3 oz.

RABBIT SOUP À LA REINE.

Wash and soak thoroughly three young rabbits, put them whole into the soup-pot, and pour on them seven pints of cold water or of clear veal broth; when they have stewed gently about three quarters of an hour lift them out, and take off the flesh of the backs, with a little from the legs should there not be half a pound of the former; strip off the skin, mince the meat very small, and pound it to the smoothest paste; cover it from the air, and set it by. Put back into the soup the bodies of the rabbits, with two mild onions of moderate size, a head of celery, three carrots, a faggot of savoury herbs, two blades of mace, a half-teaspoonful of peppercorns, and an ounce of salt. Stew the whole softly three hours; strain it off, let it stand to settle, pour it gently from the sediment, put from four to five pints into a clean stewpan, and mix it very gradually while hot with the pounded rabbit-flesh; this must be done with care, for if the liquid be not added in very small portions at first, the meat will gather into lumps and will not easily be worked smooth afterwards. Add as much pounded mace and cayenne as will season the soup pleasantly, and pass it through a coarse but very clean sieve; wipe out the stewpan, put back the soup into it, and stir in when it boils, a pint and a quarter of good cream[32] mixed with a tablespoonful of the best arrow-root: salt, if needed, should be thrown in previously.

Footnote 32:

We give this receipt exactly as we had it first compounded, but less cream and rather more arrow-root might be used for it, and would adapt it better to the economist.

Young rabbits, 3; water, or clear veal broth, 7 pints: 3/4 of an hour. Remains of rabbits; onions, 2; celery, 1 head; carrots, 3; savoury herbs; mace, 2 blades; white peppercorns, a half-teaspoonful; salt, 1 oz.: 3 hours. Soup, 4 to 5 pints; pounded rabbit-flesh, 8 oz.; salt, mace, and cayenne, if needed; cream, 1-1/4 pint; arrow-root, 1 tablespoonful (or 1-1/2 ounce).

BROWN RABBIT SOUP.

Cut down into joints, flour, and fry lightly, two full grown, or three young rabbits; add to them three onions of moderate size, also fried to a clear brown; on these pour gradually seven pints of boiling water, throw in a large teaspoonful of salt, clear off all the scum

with care as it rises, and then put to the soup a faggot of parsley, four not very large carrots, and a small teaspoonful of peppercorns; boil the whole very softly from five hours to five and a half; add more salt if needed, strain off the soup, let it cool sufficiently for the fat to be skimmed clean from it, heat it afresh, and send it to table with sippets of fried bread. Spice, with a thickening of rice-flour, or of wheaten flour browned in the oven, and mixed with a spoonful or two of very good mushroom catsup, or of Harvey's sauce, can be added at pleasure to the above, with a few drops of eschalot-wine, or vinegar; but the simple receipt will be found extremely good without them.

Rabbits, 2 full grown, or 3 small; onions fried, 3 middling-sized; water, 7 pints; salt, 1 large teaspoonful or more; carrots, 4, a faggot of parsley; peppercorns, 1 small teaspoonful: 5 to 5-1/2 hours.

SUPERLATIVE HARE SOUP.

Cut down a hare into joints, and put into a soup-pot, or large stewpan, with about a pound of lean ham, in thick slices, three moderate-sized mild onions, three blades of mace, a faggot of thyme, sweet marjoram, and parsley, and about three quarts of good beef stock. Let it stew very gently for full two hours from the time of its first beginning to boil, and more, if the hare be old. Strain the soup and pound together very fine the slices of ham and all the flesh of the back, legs, and shoulders of the hare, and put this meat into a stewpan with the liquor in which it was boiled, the crumb of two French rolls, and half a pint of port wine. Set it on the stove to simmer twenty minutes; then rub it through a sieve, place it again on the stove till very hot, but do not let it boil: season it with salt and cayenne, and send it to table directly.

Hare, 1; ham, 12 to 16 oz.; onions, 3 to 6; mace, 3 blades; faggot of savoury herbs; beef stock, 3 quarts: 2 hours. Crumb of 2 rolls; port wine, 1/2 pint; little salt and cayenne: 20 minutes.

A LESS EXPENSIVE HARE SOUP.[33]

Footnote 33:

The remains of a roasted hare, with the forcemeat and gravy, are admirably calculated for making this soup.

Pour on two pounds of neck or shin of beef and a hare well washed and carved into joints, one gallon of cold water, and when it boils and has been thoroughly skimmed, add an ounce and a half of salt, two onions, one large head of celery, three moderate-sized carrots, a teaspoonful of black peppercorns, and six cloves.

Let these stew very gently for three hours, or longer, should the hare not be perfectly tender. Then take up the principal joints, cut the meat from them, mince, and pound it to a fine paste, with the crumb of two penny rolls (or two ounces of the crumb of household bread) which has been soaked in a little of the boiling soup, and then pressed very dry in a cloth; strain, and mix smoothly with it the stock from the remainder of the hare; pass the soup through a strainer, season it with cayenne, and serve it when at the point of boiling; if not sufficiently thick, add to it a tablespoonful of arrow-root moistened with a little cold broth, and let the soup simmer for an instant afterwards. Two or three glasses of port wine, and two dozens of small forcemeat-balls, may be added to this soup with good effect.

Beef, 2 lbs.; hare, 1; water, 1 gallon; salt, 1-1/2 oz.; onions, 2; celery, 1 head; carrots, 3; bunch of savoury herbs; peppercorns, 1 teaspoonful; cloves, 6: 3 hours, or more. Bread, 2 oz.; cayenne, arrow-root (if needed), 1 tablespoonful.

ECONOMICAL TURKEY SOUP.

The remains of a roast turkey, even after they have supplied the usual mince and broil, will furnish a tureen of cheap and excellent soup with the addition of a little fresh meat. Cut up rather small two pounds of the neck or other lean joint of beef, and pour to it five pints of cold water. Heat these very slowly; skim the liquor when it begins to boil, and add to it an ounce of salt, a small, mild onion (the proportion of all the vegetables may be much increased when they are liked), a little celery, and the flesh and bones of the turkey, with any gravy or forcemeat that may have been left with them. Let these boil gently for about three hours; then strain off the soup through a coarse sieve or cullender, and let it remain until the fat can be entirely removed from it. It may then be served merely well thickened with rice[34] which has previously been boiled very dry as for currie, and stewed in it for about ten minutes; and seasoned with one large heaped tablespoonful or more of minced parsley, and as much salt and pepper or cayenne as it may require. This, as the reader will perceive, is a somewhat frugal preparation, by which the residue of a roast turkey may be turned to economical account; but it is a favourite soup at some good English tables, where its very simplicity is a recommendation. It can

always be rendered _more expensive_, and of richer quality, by the addition of lean ham or smoked beef,[35] a larger weight of fresh meat, and catsup or other store-sauces.

Footnote 34:

It will be desirable to prepare six ounces of rice, and to use as much of it as may be required, the reduction of the stock not being always equal, and the same weight of rice therefore not being in all cases sufficient. Rice-flour can be substituted for the whole grain and used as directed for _Rice Flour Soup_, page 15.

Footnote 35:

As we have stated in our chapter of Foreign Cookery, the _Jewish_ smoked beef, of which we have given particulars there, imparts a superior flavour to soups and gravies; and it is an economical addition to them, as a small portion of it will much heighten their savour.

Turkey soup _à la reine_ is made precisely like the _Potage à la Reine_ of fowls or pullets, of which the receipt will be found in another part of this chapter.

PHEASANT SOUP.

Half roast a brace of well-kept pheasants, and flour them rather thickly when they are first laid to the fire. As soon as they are nearly cold take all the flesh from the breasts, put it aside, and keep it covered from the air; carve down the remainder of the birds into joints, bruise the bodies thoroughly, and stew the whole gently from two to three hours in five pints of strong beef broth; then strain off the soup, and press as much of it as possible from the pheasants. Let it cool; and in the mean time strip the skins from the breasts, mince them small, and pound them to the finest paste, with half as much fresh butter, and half of dry crumbs of bread; season these well with cayenne, sufficiently with salt, and moderately with pounded mace and grated nutmeg, and add, when their flavour is liked, three or four eschalots previously boiled tender in a little of the soup, left till cold, and minced before they are put into the mortar. Moisten the mixture with the yolks of two or three eggs, roll it into small balls of equal size, dust a little flour upon them, skim all the fat from the soup, heat it in a clean stewpan, and when it boils throw them in and poach them from ten to twelve minutes, but first ascertain that the soup is properly seasoned with salt and cayenne. We have recommended that the birds should be partially roasted before they are put into the soup-pot, because their flavour is much finer when this is done than when they are simply stewed; they should be placed rather near to a brisk fire that they may be quickly browned on the surface without losing any of their juices, and the basting should be constant. A slight thickening of rice-flour and arrow-root can be added to the soup at pleasure, and the forcemeat-balls may be fried and dropped into the tureen when they are preferred so. Half a dozen eschalots lightly browned in butter, and a small head of celery, may also be thrown in after the birds begin to stew, but nothing should be allowed to prevail ever the natural flavour of the game itself; and this should be observed equally with other kinds, as partridges, grouse, and venison.

Pheasants, 2. roasted 20 to 25 minutes. Strong beef broth, or stock, 5 pints: 2 to 3 hours. Forcemeat-balls: breasts of pheasants, half as much dry bread-crumbs and of butter, salt, mace, cayenne; yolks of 2 or 3 eggs (and at choice 3 or 4 boiled eschalots).

Obs.—The stock may be made of six pounds of shin of beef, and four quarts of water reduced to within a pint of half. An onion, a large carrot, a bunch of savoury herbs, and some salt and spice should be added to it: one pound of neck of veal or of beef will improve it.

ANOTHER PHEASANT SOUP.

Boil down the half-roasted birds as directed in the foregoing receipt, and add to the soup, after it is strained and re-heated, the breasts pounded to the finest paste with nearly as much bread soaked in a little of the stock and pressed very dry; for the proper manner of mixing them, see _Potage à la Reine_, page 29. Half a pint of small mushrooms cleaned as for pickling, then sliced rather thickly, and stewed from ten to fifteen minutes without browning, in an ounce or two of fresh butter, with a slight seasoning of mace, cayenne, and salt, then turned into the mortar and pounded with the other ingredients, will be found an excellent addition to the soup, which must be passed through a strainer after the breasts are added to it, brought to the point of boiling, and served with sippets _à la Reine_, or with others simply fried of a delicate brown and well dried. We have occasionally had a small quantity of delicious soup made with the remains of birds which have been served at table; and where game is frequently dressed, the cook, by reserving all the fragments for the purpose, and combining different kinds, may often send up a good tureen of such, made at a

very slight cost.

Pheasants, 2; stock, 5 pints; bread soaked in gravy (see Panada, Chapter VIII), nearly as much _in bulk_ as the flesh of the breasts of the birds; mushrooms, 1/2 pint, stewed in one or two oz. of butter 10 to 15 minutes, then pounded with flesh of pheasants. Salt, cayenne and mace, to season properly.

PARTRIDGE SOUP.

This is, we think, superior in flavour to the pheasant soup. It should be made in precisely the same manner, but three birds allowed for it instead of two. Grouse and partridges together will make a still finer one; the remains of roast grouse even, added to a brace of partridges, will produce a very good effect.

MULLAGATAWNY SOUP.

Slice, and fry gently in some good butter three or four large onions, and when they are of a fine equal amber-colour lift them out with a slice and put them into a deep stewpot, or large thick saucepan; throw a little more butter into the pan, and then brown lightly in it a young rabbit, or the prime joints of two, or a fowl cut down small, and floured. When the meat is sufficiently browned, lay it upon the onions, pour gradually to them a quart of good boiling stock, and stew it gently from three quarters of an hour to an hour; then take it out, and pass the stock and onions through a fine sieve or strainer. Add to them two pints and a half more of stock, pour the whole into a clean pan, and when it boils stir to it two tablespoonsful of currie-powder mixed with nearly as much of browned flour, and a little cold water or broth, put in the meat, and simmer it for twenty minutes or longer should it not be perfectly tender, add the juice of a small lemon just before it is dished, serve it very hot, and send boiled rice to table with it. Part of a pickled mango cut into strips about the size of large straws, is sometimes served in this soup, after being stewed in it for a few minutes; a little of the pickle itself should be added with it. We have given here the sort of receipt commonly used in England for mullagatawny, but a much finer soup may be made by departing from it in some respects. The onions, of which the proportion may be increased or diminished to the taste, after being fried slowly and with care, that no part should be overdone, may be stewed for an hour in the first quart of stock with three or four ounces of grated cocoa-nut,[36] which will impart a rich mellow flavour to the whole. After all of this that can be rubbed through the sieve has been added to as much more stock as will be required for the soup, and the currie-powder and thickening have been boiled in it for twenty minutes, the flesh of part of a calf's head,[37] previously stewed almost tender, and cut as for mock turtle, with a sweetbread also parboiled or stewed in broth, and divided into inch-squares, will make an admirable mullagatawny, if simmered in the stock until they have taken the flavour of the currie-seasoning. The flesh of a couple of calves' feet, with a sweetbread or two, may, when more convenient, be substituted for the head. A large cupful of thick cream, first mixed and boiled with a teaspoonful of flour or arrow-root to prevent its curdling, and stirred into the soup before the lemon-juice, will enrich and improve it much.

Footnote 36:

That our readers to whom this ingredient in soups is new, may not be misled, we must repeat here, that although the cocoa-nut when it is young and fresh imparts a _peculiarly_ rich flavour to any preparation, it is not liked by all eaters, and is better omitted when the taste of a party is not known, and only one soup is served.

Footnote 37:

The scalp or skin only of a calf's head will make excellent mullagatawny, with good broth for stock; and many kinds of shell-fish also.

Rabbit, 1, or the best joints of, 2, or fowl, 1; large onions, 4 to 6; stock, 1 quart: 3/4 to 1 hour. 2-1/2 pints more of stock; currie-powder, 2 heaped tablespoonsful, with 2 of browned flour; meat and all simmered together 20 minutes or more; juice of lemon, 1 small; or part of pickled mango stewed in the soup 3 to 4 minutes.

Or,—onions, 3 to 6; cocoa-nut, 3 to 4 oz.; stock, 1 quart; stewed 1 hour. Stock, 3 pints (in addition to the first quart); currie-powder and thickening each, 2 large tablespoonsful: 20 minutes. Flesh of part of calf s head and sweetbread, 15 minutes or more. Thick cream, 1 cupful; flour or arrow-root, 1 teaspoonful; boiled 2 minutes, and stirred to the soup. Chili vinegar, 1 tablespoonful, or lemon-juice, 2 tablespoonsful.

Obs. 1.—The brain of the calf's head stewed for twenty minutes in a little of the stock, then rubbed through a sieve, diluted gradually with more of the stock, and added as thickening to the soup, will be found an admirable substitute for part of the flour.

Obs. 2.—Three or four pounds of a breast of veal, or an equal weight of mutton, free from bone and fat, may take the place of rabbits or fowls in this soup, for a plain dinner. The veal should be cut into squares of an inch and a half, or into strips of an inch in width, and two in length; and the mutton should be trimmed down in the same way, or into very small cutlets.

Obs. 3.—For an elegant table, the joints of rabbit or of fowl should always be boned before they are added to the soup, for which, in this case, a couple of each will be needed for a single tureen, as all the inferior joints must be rejected.

TO BOIL RICE FOR MULLAGATAWNY SOUPS, OR FOR CURRIES.

The Patna, or small-grained rice, which is not so good as the Carolina, for the general purposes of cookery, ought to be served with currie. First take out the unhusked grains, then wash the rice in several waters, and put it into a large quantity of cold water; bring it gently to boil, keeping it uncovered, and boil it softly for fifteen minutes, when it will be perfectly tender, and every grain will remain distinct. Throw it into a _large_ cullender, and let it drain for ten minutes near the fire; should it not then appear _quite_ dry, turn it into a dish, and set it for a short time into a gentle oven, or let it steam in a clean saucepan near the fire. It should neither be stirred, except just at first, to prevent its lumping while it is still quite hard, nor touched with either fork or spoon; the stewpan may be shaken occasionally, should the rice seem to require it, and it should be thrown lightly from the cullender upon the dish. A couple of minutes before it is done, throw in some salt, and from the time of its beginning to boil remove the scum as it rises.

Patna rice, 1/2 lb.; cold water, 2 quarts: boiled slowly, 15 minutes. Salt, 1 large teaspoonful.

Obs.—This, of all the modes of boiling rice which we have tried, and they have been very numerous, is indisputably the best. The Carolina rice answers well dressed in the same manner, but requires four or five minutes longer boiling: it should never be served until it is quite tender. One or two minutes, more or less, will sometimes, from the varying quality of the grain, be requisite to render it tender.

GOOD VEGETABLE MULLAGATAWNY.

Dissolve in a large stewpan or thick iron saucepan, four ounces of butter, and when it is on the point of browning, throw in four large mild onions sliced, three pounds weight of young vegetable marrow cut in large dice and cleared from the skin and seeds, four large or six moderate-sized cucumbers, pared, split, and emptied likewise of their seeds, and from three to six large acid apples, according to the taste; shake the pan often, and stew these over a gentle fire until they are tolerably tender; then strew lightly over and mix well amongst them, three heaped tablespoonsful of mild currie powder, with nearly a third as much of salt, and let the vegetables stew from twenty to thirty minutes longer; then pour to them gradually sufficient boiling water (broth or stock if preferred) to just cover them, and when they are reduced almost to a pulp press the whole through a hair-sieve with a wooden spoon, and heat it in a clean stewpan, with as much additional liquid as will make two quarts with that which was first added. Give any flavouring that may be needed, whether of salt, cayenne, or acid, and serve the soup extremely hot. Should any butter appear on the surface, let it be carefully skimmed off, or stir in a small dessertspoonful of arrow-root (smoothly mixed with a little cold broth or water) to absorb it. Rice may be served with this soup at pleasure, but as it is of the consistence of winter peas soup, it scarcely requires any addition. The currie powder may be altogether omitted for variety, and the whole converted into a plain vegetable _potage_; or it may be rendered one of high savour, by browning all the vegetables lightly, and adding to them rich brown stock. Tomatas, when in season, may be substituted for the apples, after being divided, and freed from their seeds.

Butter, 4 oz.; vegetable marrow, pared and scooped, 3 lbs.; large mild onions, 4; large cucumbers, 4; or middling-sized, 6; apples, or large tomatas, 3 to 6; 30 to 40 minutes. Mild currie-powder, 3 heaped tablespoonsful; salt, one small tablespoonful 20 to 32 minutes. Water, broth, or good stock, 2 quarts.

CUCUMBER SOUP.

Pare, split, and empty from eight to twenty[38] fine, well grown, but not old cucumbers,—those which have the fewest seeds are best for the purpose; throw a little salt over them, and leave them for an hour to drain, then put them with the white part only of a couple of mild onions into a deep stewpan or delicately clean saucepan, cover them nearly half an inch with pale but good veal stock, and stew them gently until they are perfectly tender, which will be in from three quarters of an hour to an hour and a quarter; work the whole through a hair-sieve, and add to it as much more stock as may be needed to make the quantity of soup required for

table; and as the cucumbers, from their watery nature, will thicken it but little, stir to it when it boils, as much arrow-root, rice-flour, or _tous les mois_ (see page 1), as will bring it to a good consistence; add from half to a whole pint of boiling cream, and serve the soup immediately. Salt and cayenne sufficient to season it, should be thrown over the cucumbers while they are stewing. The yolks of six or eight eggs, mixed with a dessertspoonful of chili vinegar, may be used for this soup instead of cream; three dessertspoonsful of minced parsley may then be strewed into it a couple of minutes before they are added: it must not, of course, be allowed to boil after they are stirred in.

Footnote 38:

This is a great disparity of numbers; but some regard must be had to expense, where the vegetable cannot be obtained with facility.

SPRING SOUP AND SOUP À LA JULIENNE.

Throw into three quarts of strong clear broth, or shin of beef stock, or of _consommé_, half a pint each of turnips and carrots prepared by the directions of page 20, or turned into any other shape that may be preferred, with rather less of the solid part of some white celery stems, and of leeks or of very mild onions[39] mixed. The latter must, if used, be sliced, drawn into rings, and divided into slight shreds. When these have simmered from twenty to thirty minutes, add the leaves of one or two lettuces and a few of sorrel, trimmed or torn, about the size of half-a-crown. Continue the gentle boiling until these are tender, and add at the moment of serving half a pint of asparagus-points boiled very green, and as many French beans cut into small lozenges, and also boiled apart; or substitute green peas for these last.

Footnote 39:

Only a very _subdued_ flavour of these is, we think, admissible for a delicate vegetable soup of any kind.

For the _Julienne_ soup, first stew the carrots, &c. tolerably tender in a couple of ounces of butter; pour the stock boiling to them; skim off all the fat from the surface, and finish as above. Sprigs of chervil, spinach (boiled apart, and sparingly added), green onions, very small tufts of brocoli or cauliflower, may all be used in these soups at choice. Both the kind and the proportion of the vegetables can be regulated entirely by the taste. Bread stamped out with a _very small_ round cutter, and dried a pale brown in the oven, is added sometimes to this spring soup, but is, we should say, no improvement. Winter vegetables should have three or four minutes' previous boiling (or blanching) before they are put into the soup.

AN EXCELLENT GREEN PEAS SOUP.

Take at their fullest size, but before they are of bad colour or worm-eaten, three pints of fine large peas, and boil them as for table (see Chapter XVII.) with half a teaspoonful of carbonate of soda in the water, that they may be very green. When they are quite tender, drain them well, and put them into a couple of quarts of boiling, pale, but _good_ beef or veal stock, and stew them in it gently for half an hour; then work the whole through a fine hair-sieve, put it into a clean pan and bring it to the point of boiling; add salt, should it be needed, and a small teaspoonful of pounded sugar; clear off the scum entirely, and serve the soup as hot as possible. An elegant variety of it is made by adding a half pint more of stock to the peas, and about three quarters of a pint of asparagus points, boiled apart, and well drained before they are thrown into it, which should be done only the instant before it is sent to table.

Green peas, 3 pints: boiled 25 to 30 minutes, or more. Veal or beef stock, 2 quarts (with peas): 1/2 an hour. Sugar, one small teaspoonful; salt, if needed.

Obs.—When there is no stock at hand, four or five pounds of shin of beef boiled slowly down with three quarts of water to two, and well seasoned with savoury herbs, young carrots, and onions, will serve instead quite well. A thick slice of lean, undressed ham, or of Jewish beef, would improve it.

Should a common English peas soup be wished for, make it somewhat thinner than the one above, and add to it, just before it is dished, from half to three quarters of a pint of young peas boiled tender and well drained.

GREEN PEAS SOUP, WITHOUT MEAT.

Boil tender in three quarts of water, with the proportions of salt and soda directed for them in Chapter XVII., one quart of large, full grown peas; drain and pound them in a mortar, mix with them gradually five pints of the liquor in which they were cooked, put the

whole again over the fire, and stew it gently for a quarter of an hour; then press it through a hair-sieve. In the mean time, simmer in from three to four ounces of butter,[40] three large, or four small cucumbers pared and sliced, the hearts of three or four lettuces shred small, from one to four onions, according to the taste, cut thin, a few small sprigs of parsley, and, when the flavour is liked, a dozen leaves or more of mint roughly chopped: keep these stirred over a gentle fire for nearly or quite an hour, and strew over them a half-teaspoonful of salt, and a good seasoning of white pepper or cayenne. When they are partially done drain them from the butter, put them into the strained stock, and let the whole boil gently until all the butter has been thrown to the surface, and been entirely cleared from it; then throw in from half to three quarters of a pint of young peas boiled as for eating, and serve the soup immediately.

Footnote 40:

Some persons prefer the vegetables slowly fried to a fine brown, then drained on a sieve, and well dried before the fire; but though more savoury so, they do not improve the colour of the soup.

When more convenient, the peas, with a portion of the liquor, may be rubbed through a sieve, instead of being crushed in a mortar; and when the colour of the soup is not so much a consideration as the flavour, they may be slowly stewed until perfectly tender in four ounces of good butter, instead of being boiled: a few green onions, and some branches of parsley may then be added to them.

Green peas, 1 quart; water, 5 pints: cucumbers, 3 to 6; lettuces, 3 or 4; onions, 1 to 4; little parsley; mint (if liked), 12 to 20 leaves; butter, 3 to 4 oz.; salt, half-teaspoonful; seasoning of white pepper or cayenne: 50 to 60 minutes. Young peas, 1/2 to 3/4 of a pint.

Obs.—We must repeat that the peas for these soups must not be _old_, as when they are so, their fine sweet flavour is entirely lost, and the dried ones would have almost as good an effect; nor should they be of inferior kinds. Freshly gathered marrowfats, taken at nearly or quite their full growth, will give the best quality of soup. We are credibly informed, but cannot assert it on our own authority, that it is often made for expensive tables in early spring, with the young tender plants or halms of the peas, when they are about a foot in height. They are cut off close to the ground, like small salad, we are told, then boiled and pressed through a strainer, and mixed with the stock. The flavour is affirmed to be excellent.

A CHEAP GREEN PEAS SOUP.

Wash very clean and throw into an equal quantity of boiling water salted as for peas, three quarts of the shells, and in from twenty to thirty minutes, when they will be quite tender, turn the whole into a large strainer, and press the pods strongly with a wooden spoon. Measure the liquor, put two quarts of it into a clean deep saucepan, and when it boils add to it a quart of full grown peas, two or even three large cucumbers, as many moderate-sized lettuces freed from the coarser leaves and cut small, one large onion (or more if liked) sliced extremely thin and stewed for half an hour in a morsel of butter before it is added to the soup, or gently fried without being allowed to brown; a branch or two of parsley, and, when the flavour is liked, a dozen leaves of mint. Stew these softly for an hour, with the addition of a small teaspoonful, or a larger quantity if required of salt, and a good seasoning of fine white pepper or of cayenne; then work the whole of the vegetables with the soup through a hair-sieve, heat it afresh, and send it to table with a dish of small fried sippets. The colour will not be so bright as that of the more expensive soups which precede it, but it will be excellent in flavour.

Pea-shells, 3 quarts; water, 3 quarts: 20 to 30 minutes. Liquor from these, 2 quarts; full-sized green peas, 1 quart; large cucumbers, 2 or 3; lettuces, 3; onion, 1 (or more); little parsley; mint, 12 leaves; seasoning of salt and pepper or cayenne: stewed 1 hour.

Obs.—The cucumbers should be pared, quartered, and freed from the seeds before they are added to the soup. The peas, as we have said already more than once, should not be _old_, but taken at their full growth, before they lose their colour: the youngest of the shells ought to be selected for the liquor.

RICH PEAS SOUP.

Soak a quart of fine yellow split peas for a night, drain them well, and put them into a large soup-pot with five quarts of good brown gravy stock; and when they have boiled gently for half an hour, add to the soup three onions, as many carrots, and a turnip or two, all sliced and fried carefully in butter; stew the whole softly until the peas are reduced to pulp, then add as much salt and cayenne as may be needed to season it well, give it two or three minutes' boil, and pass it through a sieve, pressing the vegetables with it. Put into a clean saucepan as much as may be required for table, add a little fresh stock to it should it be too thick, and reduce it by quick boiling if too thin; throw in the white part of some fresh celery sliced a quarter of an inch thick, and when this is tender send

the soup quickly to table with a dish of small fried or toasted sippets. A dessertspoonful or more of currie-powder greatly improves peas soup: it should be smoothly mixed with a few spoonsful of it, and poured to the remainder when this first begins to boil after having been strained.

Split peas, 1 quart: soaked one night. Good brown gravy soup, 5 quarts: 30 minutes. Onions and carrots browned in butter, 3 of each; turnips, 2: 2-1/2 to 3-1/2 hours. Cayenne and salt as needed. Soup, 5 pints; celery, sliced, 1 large or 2 small heads: 20 minutes.

Obs.—When more convenient, six pounds of neck of beef well scored and equally and carefully browned, may be boiled gently with the peas and fried vegetables in a gallon of water (which should be poured to them boiling) for four or five hours.

COMMON PEAS SOUP.

Wash well a quart of good split peas, and float off such as remain on the surface of the water; soak them for one night, and boil them with a bit of soda the size of a filbert in just sufficient water to allow them to break to a mash. Put them into from three to four quarts of good beef broth, and stew them in it gently for an hour; then work the whole through a sieve, heat afresh as much as may be required for table, season it with salt and cayenne or common pepper, clear it perfectly from scum, and send it to table with fried or toasted bread. Celery sliced and stewed in it as directed for the rich peas soup, will be found a great improvement to this.

Peas, 1 quart: soaked 1 night; boiled in 2 quarts or rather more of water, 2 to 2-1/2 hours. Beef broth, 3 to 4 quarts: 1 hour. Salt and cayenne or pepper as needed: 3 minutes.

PEAS SOUP WITHOUT MEAT.

To a pint of peas, freed from all that are worm-eaten, and well washed, put five pints of cold water, and boil them tolerably tender; then add a couple of onions (more or less according to the taste), a couple of fine carrots grated, one large or two moderate-sized turnips sliced, all gently fried brown in butter; half a teaspoonful of black pepper, and three times as much of salt. Stew these softly, keeping them often stirred, until the vegetables are sufficiently tender to pass through a sieve; then rub the whole through one, put it into a clean pan, and when it boils throw in a sliced head of celery, heighten the seasoning if needful, and in twenty minutes serve the soup as hot as possible, with a dish of fried or toasted bread cut into dice. A little chili vinegar can be added when liked: a larger proportion of vegetables also may be boiled down with the peas at pleasure. Weak broth, or the liquor in which a joint has been boiled, can be substituted for the water; but the soup is very palatable as we have given the receipt for it. Some persons like it flavoured with a little mushroom catsup. All peas soup is rendered more wholesome by the addition of a small quantity of currie-paste or powder.

Split peas, 1 pint; water, 5 pints: 2 hours or more. Onions, 2; carrots, 2; large turnip, 1; pepper, 1/2 teaspoonful; salt, 1-1/2 teaspoonful: 1 to 1-1/2 hour. Celery, 1 head: 20 minutes.

OX-TAIL SOUP.

An inexpensive and very nutritious soup may be made of ox-tails, but it will be insipid in flavour without the addition of a little ham, knuckle of bacon, or a pound or two of other meat. Wash and soak three tails, pour on them a gallon of cold water, let them be brought gradually to boil, throw in an ounce and a half of salt, and clear off the scum carefully as soon as it forms upon the surface; when it ceases to rise, add four moderate-sized carrots, from two to four onions, according to the taste, a large faggot of savoury herbs, a head of celery, a couple of turnips, six or eight cloves, and a half-teaspoonful of peppercorns. Stew these gently from three hours to three and a half, if the tails be very large; lift them out, strain the liquor, and skim off all the fat; divide the tails into joints, and put them into a couple of quarts or rather more of the stock; stir in, when these begin to boil, a thickening of arrow-root or of rice flour (see page 4), mixed with as much cayenne and salt as may be required to flavour the soup well, and serve it very hot. If stewed down until the flesh falls away from the bones, the ox-tails will make stock which will be quite a firm jelly when cold; and this, strained, thickened, and well flavoured with spices, catsup, or a little wine, would, to many tastes, be a superior soup to the above. A richer one still may be made by pouring good beef broth instead of water to the meat in the first instance.

Ox-tails, 3; water, 1 gallon; salt, 1-1/2 oz.; carrots, 4; onions, 2 to 4; turnips, 2; celery, 1 head; cloves, 8; peppercorns, 1/2 teaspoonful; faggot of savoury herbs: 3 hours to 3-1/2. For a richer soup, 5 to 6 hours. (Ham or gammon of bacon at pleasure, with other flavourings.)

Obs.—To increase the savour of this soup when the meat is not served in it, the onions, turnips, and carrots may be gently fried until of a fine light brown, before they are added to it.

A CHEAP AND GOOD STEW SOUP.

Put from four to five pounds of the gristly part of the shin of beef into three quarts of cold water, and stew it very softly indeed, with the addition of the salt and vegetables directed for _bouillon_ (see page 7), until the whole is very tender; lift out the meat, strain the liquor, and put it into a large clean saucepan, add a thickening of rice-flour or arrow-root, pepper and salt if needed, and a tablespoonful of mushroom catsup. In the mean time, cut all the meat into small, thick slices, add it to the soup, and serve it as soon as it is very hot. The thickening and catsup may be omitted, and all the vegetables, pressed through a strainer, may be stirred into the soup instead, before the meat is put back into it.

SOUP IN HASTE.

Chop tolerably fine a pound of lean beef, mutton, or veal, and when it is partly done, add to it a small carrot and one small turnip cut in slices, half an ounce of celery, the white part of a moderate-sized leek, or a quarter of an ounce of onion. Mince all these together, and put the whole into a deep saucepan with three pints of cold water. When the soup boils take off the scum, and add a little salt and pepper. In half an hour it will be ready to serve with or without straining: it may be flavoured at will, with cayenne, catsup, or aught else that is preferred, or it may be converted into French spring broth, by passing it through a sieve, and boiling it again for five or six minutes, with a handful of young and well washed sorrel. Meat, 1 lb.; carrot, 2 oz.; turnip, 1-1/2 oz.; celery, 1/2 oz.; onion, 1/4 oz. water, 3 pints: half an hour. Little pepper and salt.

Obs.—Three pounds of beef or mutton, with two or three slices of ham, and vegetables in proportion to the above receipt, all chopped fine, and boiled in three quarts of water for an hour and a half, will make an excellent family soup on an emergency: additional boiling will of course improve it, and a little spice should be added after it has been skimmed and salted. It may easily be converted into carrot, turnip, or ground-rice soup after it is strained.

VEAL OR MUTTON BROTH.

To each pound of meat add a quart of cold water, bring it gently to boil, skim it very clean, add salt in the same proportion as for _bouillon_ (see page 7), with spices and vegetables also, unless _unflavoured_ broth be required, when a few peppercorns, a blade or two of mace, and a bunch of savoury herbs, will be sufficient; though for some purposes even these, with the exception of the salt, are better omitted. Simmer the broth for about four hours, unless the quantity be very small, when from two and a half to three, will be sufficient. A little rice boiled down with the meat will both thicken the broth, and render it more nutritious. Strain it off when done, and let it stand till quite cold that the fat may be entirely cleared from it: this is especially needful when it is to be served to an invalid.

Veal or mutton, 4 lbs.; water, 4 quarts; salt. (For vegetables, &c., see page 7;) rice (if used), 4 oz.: 4 hours or more.

MILK SOUP WITH VERMICELLI.

Throw into five pints of boiling milk a small quantity of salt, and then drop lightly into it five ounces of good fresh vermicelli; keep the milk stirred as this is added, to prevent its gathering into lumps, and continue to stir it very frequently from fifteen to twenty minutes, or until it is perfectly tender. The addition of a little pounded sugar and powdered cinnamon renders this a very agreeable dish. In Catholic countries, milk soups of various kinds constantly supply the place of those made with meat, on _maigre_ days; and with us they are sometimes very acceptable, as giving a change of diet for the nursery or sick room. Rice, semoulina, sago, cocoa-nut, and maccaroni may all in turn be used for them as directed for other soups in this chapter, but they will be required in rather smaller proportions with the milk.

Milk, 5 pints; vermicelli, 5 oz.: 15 to 20 minutes.

CHEAP RICE SOUP.

Place a gallon of water on the fire (more or less according to the quantity of soup required), and when it boils, throw in a moderate-sized tablespoonful of salt, and two or three onions, thickly sliced, a faggot of sweet herbs, a root of celery, and three or four large carrots split down into many divisions, and cut into short lengths. Boil these gently for an hour and a half, or two hours,

and then strain the liquor from them. When time will permit, let it become cold; then for each quart, take from three to four ounces of well washed rice, pour the soup on it, heat it _very_ slowly, giving it an occasional stir, and stew it gently until it is perfectly tender, and the potage quite thick. A moderate seasoning of pepper, and an ounce or two of fresh butter well blended with a teaspoonful of flour, may be thoroughly stirred up with the soup before it is served; or, in lieu of the butter, the yolks of two or three new-laid eggs, mixed with a little milk, may be carefully added to it.

It may be more quickly prepared by substituting vermicelli, semoulina, or soujee for the rice, as this last will require three quarters of an hour or more of stewing after it begins to boil, and the three other ingredients—either of which must be dropped gradually into the soup when it is in full ebullition—will be done in from twenty to thirty minutes; and two ounces will thicken sufficiently a quart of broth.

A large tablespoonful of Captain White's currie-paste, and a small one of flour, diluted with a spoonful or twos of the broth, or with a little milk or cream, if perfectly mixed with the rice and stewed with it for fifteen or twenty minutes before it is dished, render it excellent: few eaters would discover that it was made without meat.

Good beef or mutton broth can be used instead of water for the above soup, and in that case the vegetables sliced small, or rubbed through a strainer, may be added to it before it is served.

CARROT SOUP MAIGRE.

Throw two ounces of salt into a gallon of boiling water, then add three or four carrots quartered or thickly sliced, one onion or more according to the taste, and a faggot of parsley, or some parsley roots. When these have boiled gently for upwards of an hour, strain off the liquor and put it back into the saucepan. Have ready more carrots, nicely scraped and washed; split them down into strips about the size of large macaroni and cut them into half finger lengths. Two quarts of these will not be too much for persons who like the soup well filled with the vegetable; boil them perfectly tender, and turn them with their liquor into the tureen, first adding pepper sufficient to season it properly, and more salt if needed. The proportion of carrots may be diminished, and a quart or more of Brussels sprouts, boiled and drained, may be substituted for part of them. Some persons have these soups thickened, or enriched as they think, with flour and butter; but the latter ingredient should at least be sparingly used; and any other kind of thickening is more wholesome. A few ounces of vermicelli stewed in them for twenty minutes or rather longer, will be found a very good one. Celery, leeks, and turnips may be boiled down in the carrot-stock, or added when the fresh vegetables have been stewed in it for about ten minutes.

CHEAP FISH SOUPS.

An infinite variety of excellent soups may be made of fish, which may be stewed down for them in precisely the same manner as meat, and with the same addition of vegetables and herbs. When the skin is coarse or rank it should be carefully stripped off before the fish is used; and any oily particles which may float on the surface should be entirely removed from it.

In France, Jersey, Cornwall, and many other localities, the conger eel, divested of its skin, is sliced up into thick cutlets and made into soup, which we are assured by English families who have it often served at their tables, is extremely good. A half-grown fish is best for the purpose. After the soup has been strained and allowed to settle, it must be heated afresh, and rice and minced parsley may be added to it as for the turkey soup of page 32; or it may be thickened with rice-flour only, or served clear. Curried fish-soups, too, are much to be recommended.

When broth or stock has been made as above with conger eel, common eels, whitings, haddocks, codlings, fresh water fish, or any common kind, which may be at hand, flakes of cold salmon, cod fish, John Dories, or scallops of cold soles, plaice,[41] &c., may be heated and served in it; and the remains of crabs or lobsters mingled with them. The large oysters sold at so cheap a rate upon the coast, and which are not much esteemed for eating raw, serve admirably for imparting flavour to soup, and the softer portions of them may be served in it after a few minutes of gentle simmering. Anchovy or any other store fish-sauce may be added with good effect to many of these pottages if used with moderation. Prawns and shrimps likewise would generally be considered an improvement to them.

Footnote 41:

Some persons prefer the vegetables slowly fried to a fine brown, then drained on a sieve, and well dried before the fire; but though more savoury so, they do not improve the colour of the soup.

For more savoury preparations, fry the fish and vegetables, lay them into the soup-pot, and add boiling, instead of cold water to them.

BUCHANAN CARROT SOUP.

(_Excellent._)

Make two quarts of soup by either of the foregoing receipts, using for it good brown stock (for a common family dinner strong beef broth will do). Mix smoothly with a little liquid, a tablespoonful of fine currie-powder, and boil it in the soup for ten minutes; or instead of this, season it rather highly with cayenne pepper, and then stir into it from six ounces to half a pound of Patna rice boiled dry and tender as for a currie. The whole may then remain by the side of the fire without even simmering for ten minutes longer, and then be served immediately. As a winter _potage_ this is generally much liked. A spoonful of _Captain White's_ currie-paste will flavour it very agreeably if smoothly diluted, and simmered in it for two or three minutes: we prefer it always to the powder. Three or four ounces of pearl-barley well washed, soaked for some hours, and boiled extremely tender in broth or water, may on occasion be substituted for the rice.

Obs.—This receipt was, from inadvertence, omitted at its proper place, page 20, where it ought to have been inserted after the carrot soups which will be found there, and to which the reader is referred for the method of preparing the present one in part.

OBSERVATION.

The present chapter already so far exceeds the limits within which it ought to have been confined, that we are obliged to reserve several additions which we were desirous of making to it, for the chance of being able to insert them in an appendix.

CHAPTER II.

=Fish.=

[Illustration:

TO CHOOSE FISH.]

[Illustration:

Copper Fish or Ham Kettle.]

The cook should be well acquainted with the signs of freshness and good condition in fish, as they are most unwholesome articles of food when stale, and many of them are also dangerous eating when they are out of season. The eyes should always be bright, the gills of a fine clear red, the body stiff, the flesh firm, yet elastic to the touch, and the smell not disagreeable.

When all these marks are reversed, and the eyes are sunken, the gills very dark in hue, the fish itself flabby and of offensive odour, it is bad, and should be avoided. The chloride of soda, will, it is true, restore it to a tolerably eatable state,[42] if it be not very much over-kept, but it will never resemble in quality and wholesomeness fish which is fresh from the water.

Footnote 42:

We have known this applied very successfully to salmon which from some hours' keeping in sultry weather had acquired a slight degree of taint, of which no trace remained after it was dressed; as a general rule, however, fish which is not _wholesomely fresh_ should be rejected for the table.

[Illustration:

Mackerel Kettle.]

A good turbot is thick, and full fleshed, and the under side is of a pale cream colour or yellowish white; when this is of a bluish tint, and the fish is thin and soft, it should be rejected. The same observations apply equally to soles.

The best salmon and cod fish are known by a small head, very thick shoulders, and a small tail; the scales of the former should be bright, and its flesh of a fine red colour; to be eaten in perfection it should be dressed as soon as it is caught, before the curd (or white substance which lies between the flakes of flesh) has melted and rendered the fish oily. In that state it is really crimp, but continues so only for a very few hours; and it bears therefore a much higher price in the London market then, than when mellowed by having been kept a day or two.

The flesh of cod fish should be white and clear before it is boiled, whiter still after it is boiled, and firm though tender, sweet and mild in flavour, and separated easily into large flakes. Many persons consider it rather improved than otherwise by having a little salt rubbed along the inside of the back-bone and letting it lie from twenty-four to forty-eight hours before it is dressed,. It is sometimes served crimp like salmon, and must then be sliced as soon as it is dead, or within the shortest possible time afterwards.

Herrings, mackerel, and whitings, unless newly caught, are quite uneatable. When they are in good condition their natural colours will be very distinct and their whole appearance glossy and fresh. The herring when first taken from the water is of a silvery brightness; the back of the mackerel is of a bright green marked with dark stripes; but this becomes of a coppery colour as the fish grows stale. The whiting is of a pale brown or fawn colour with a pinkish tint; but appears dim and leaden-hued when no longer fresh.

Eels should be alive and brisk in movement when they are purchased, but the “horrid barbarity,” as it is truly designated, of skinning and dividing them while they are so, is without excuse, as they are easily destroyed “by piercing the spinal marrow close to the back part of the skull with a sharp pointed knife or skewer. If this be done in the right place all motion will instantly cease.” We quote Dr. Kitchener’s assertion on this subject; but we know that the mode of destruction which he recommends is commonly practised by the London fishmongers. Boiling water also will immediately cause vitality to cease, and is perhaps the most humane and ready method of destroying the fish.

Lobsters, prawns, and shrimps, are very stiff when freshly boiled, and the tails turn strongly inwards; when these relax, and the fish are soft and watery, they are stale; and the smell will detect their being so, instantly, even if no other symptoms of it be remarked. If bought alive, lobsters should be chosen by their weight and “liveliness.” The hen lobster is preferred for sauce and soups, on account of the coral; but the flesh of the male is generally considered of finer flavour for eating. The vivacity of their leaps will show when prawns and shrimps are fresh from the sea.

Oysters should close forcibly on the knife when they are opened: if the shells are apart ever so little they are losing their condition, and when they remain far open the fish are dead, and fit only to be thrown away. Small plump natives are very preferable to the larger and coarser kinds.

TO CLEAN FISH.

Let this be always done with the most scrupulous nicety, for nothing can more effectually destroy the appetite, or disgrace the cook, than fish sent to table imperfectly cleaned. Handle it lightly, and never throw it roughly about, so as to bruise it; wash it well, but do not leave it longer in the water than is necessary; for fish, like meat, loses its flavour from being soaked. When the scales are to be removed, lay the fish flat upon its side and hold it firmly with the left hand, while they are scraped off with the right; turn it, and when both sides are done, pour or pump sufficient water to float off all the loose scales; then proceed to empty it; _and do this without opening it more than is absolutely necessary for the purposes of cleanliness_. Be sure that not the slightest particle of offensive matter be left in the inside; wash out the blood entirely, and scrape or brush it away if needful from the back-bone. This may easily be accomplished without opening the fish so much as to render it unsightly when it is sent to table. When the scales are left on, the outside of the fish should be well washed and wiped with a coarse cloth, drawn gently from the head to the tail. Eels to be wholesome should be skinned, but they are sometimes dressed without; boiling water should then be poured upon them, and they should be left in it from five to ten minutes before they are cut up. The dark skin of the sole must be stripped off when it is fried, but it should be left on it like that of a turbot when the fish is boiled, and it should be dished with the white side upwards. Whitings are skinned before they are egged and crumbed for frying, but for boiling or broiling, the skin is left on them. The gills of all fish (the red mullet sometimes excepted), must be taken out. _The fins of a turbot_, _which are considered a great delicacy, should be left untouched_; but those of most other fish must be cut off.

TO KEEP FISH.

We find that all the smaller kinds of fish keep best if emptied and cleaned as soon as they are brought in, then wiped gently as dry as they can be, and hung separately by the head on the hooks in the ceiling of a cool larder, or in the open air when the weather will allow. When there is danger of their being attacked by flies, a wire safe, placed in a strong draught of air, is better adapted to the purpose. Soles in winter will remain good for two days when thus prepared; and even whitings and mackerel may be kept so without losing any of their excellence. Salt may be rubbed slightly over cod fish, and well along the back-bone; but it injures the flavour of salmon, the inside of which may be rubbed with vinegar and peppered instead. When excessive sultriness renders all of these modes unavailing, the fish must at once be partially cooked to preserve it, but this should be avoided if possible, as it is very rarely so good when this method is resorted to.

TO SWEETEN TAINTED FISH.

The application of strong vinegar, or of acetic acid (which may be purchased at the chemists'), will effect this when the taint is but slight. The vinegar should be used pure; and one wineglassful of the acid should be mixed with two of water. Pour either of these over the fish, and rub it on the parts which require it; then leave it untouched for a few minutes, and wash it afterwards well, changing the water two or three times. When the fish is in a worse state the chloride of soda, from its powerful anti-putrescent properties, will have more effect: it may be diluted, and applied in the same manner as the acid.

Obs.—We have retained here the substance of the directions which we had given in former editions of this book for _rendering eatable_ fish (and meat) tainted by being closely packed or overkept; and it is true that they may be deprived of their offensive flavour and odour by the application of strong acids and other disinfecting agents,—Beaufoy's chloride of soda more especially—but we are very doubtful whether they can by any process be converted into _unquestionably wholesome_ food, unless from some accidental circumstance the mere surface should be affected, or some small portion of them, which could be entirely cut away. We cannot, therefore, conscientiously recommend the _false economy_ of endangering health in preference to rejecting them for the table altogether.

THE MODE OF COOKING BEST ADAPTED TO DIFFERENT KINDS OF FISH.

It is not possible, the reader will easily believe, to insert in a work of the size of the present volume, all the modes of dressing the many varieties of fish which are suited to our tables; we give, therefore, only the more essential receipts in detail, and add to them such general information as may, we trust, enable even a moderately intelligent cook to serve all that may usually be required, without difficulty.

There is no better way of dressing a good turbot, brill, John Dory, or cod's head and shoulders, than plain but careful boiling. Salmon is excellent in almost every mode in which it can be cooked or used. Boiled entire or in crimped slices; roasted in a cradle-spit or Dutch oven; baked; fried in small collops; collared; potted; dried and smoked; pickled or soused (this is the coarsest and least to be recommended process for it, of any); made into a raised or common pie, or a potato-pasty; served cold in or with savoury jelly, or with a _Mayonnaise_ sauce; or laid on potatoes and baked, as in Ireland, it will be found Good.

Soles may be either boiled, or baked, or fried entire, or in fillets; curried; stewed in cream; or prepared by any of the directions given for them in the body of this chapter.

Plaice, unless when in full season and very fresh, is apt to be watery and insipid; but taken in its perfection and carefully cooked, it is very sweet and delicate in flavour. If large, it may be boiled with advantage either whole or in fillets; but to many tastes it is very superior when filleted, dipped into egg and bread-crumbs, and fried. The flesh may also be curried; or the plaice may be converted into water-souchy, or _soupe-maigre_: when small it is often fried whole.

Red mullet should always be _baked_, _broiled_, or _roasted_: it should on no occasion be boiled.

Mackerel, for which many receipts will be found in this chapter, when broiled _quite whole_, as we have directed, or freed from the bones, divided, egged, crumbed, and fried, is infinitely superior to the same fish cooked in the ordinary manner.

The whiting, when _very_ fresh and in season, is always delicate and good; and of all fish is considered the best suited to invalids. Perhaps _quite_ the most wholesome mode of preparing it for them, is to open it as little as possible when it is cleansed, to leave the skin on, to dry the fish well, and to broil it gently. It should be sent very hot to table, and will require no sauce: twenty minutes will usually be required to cook it, if of moderate size.

The haddock is sometimes very large. We have had it occasionally from our southern coast between two and three feet in length, and it was then remarkably good when simply boiled, even the day after it was caught, the white curd between the flakes of flesh being like that of extremely fresh salmon. As it is in full season in mid-winter, it can be sent to a distance without injury. It is a _very_ firm fish when large and in season; but, as purchased commonly at inland markets, is often neither fine in size nor quality. _One_ of the best modes of cooking it is, to take the flesh entire from the bones, to divide it, dip it into egg and bread-crumbs, mixed with savoury herbs finely minced, and a seasoning of salt and spice, and to fry it like soles. Other receipts for it will be found in the body of this chapter.

The flesh of the gurnard is exceedingly dry, and somewhat _over firm_, but when filled with well-made forcemeat and gently baked, it is much liked by many persons. At good tables, it is often served in fillets fried or baked, and richly sauced: in common cookery it is sometimes boiled.

Portions only of the skate, which is frequently of _enormous_ size, are used as food: these are in general cut out by the fisherman or by the salesman, and are called the wings. The flesh is commonly served here divided into long narrow fillets, called crimped skate, which are rolled up and fastened, to preserve them in that form, while they are cooked. In France, it is sent to table raised from the bones in large portions, sauced with _beurre-noir_ (burned or browned butter), and strewed with well-crisped parsley.

Trout, which is a delicious fish when stewed in gravy, either quite simply, or with the addition of wine and various condiments, and which when of small size is very sweet and pleasant, eating nicely fried, is poor and insipid when plainly boiled.[43]

Footnote 43:

We have been informed by Mr. Howitt, the well-known author of several highly interesting works on Germany, that this fish, when boiled the instant it was caught—as he had eaten it often on the banks of some celebrated German trout-streams—was most excellent, especially when it was of large size; but, as a general rule, almost any other mode of cooking is to be recommended for it in preference.

Pike, of which the flesh is extremely dry, is we think better baked than dressed in any other way; but it is often boiled.

Carp should either be stewed whole in the same manner as trout, or served cut in slices, in a rich sauce called a _matelote_.

Smelts, sand-eels, and white-bait, are always fried; the last two sometimes after being dipped into batter.

THE BEST MODE OF BOILING FISH.

We have left unaltered in the following receipts the greater number of our original directions for boiling fish, which were found when carefully followed, to produce a good result; but Baron Liebeg and other scientific writers explain clearly the principles on which the nutriment contained in fish or flesh is best retained by bringing the surface of either when it is cooked, into immediate contact with _boiling_ water; and then (after a few minutes of ebullition) lowering the temperature by the addition of cold water, and keeping it somewhat below the boiling point for the remainder of the process. This method is at least worthy of a trial, even if it be attended with a slight degree more of trouble than those in general use; but when fish is served with a variety of other dishes, the escape of some portion of its nutritious juices is of less importance than when it forms the principal food of any part of the community: in that case, the preservation of all the nourishment which can be derived from it, is of real consequence.

Directions.—Throw into as much water as will cover the fish entirely, a portion of the salt which is to be added in cooking it, and when it boils quickly take off the scum, lay in the fish, and let it boil moderately fast from three to ten minutes, according to its weight and thickness; then pour in as much cold water as there is of the boiling, take out a part, leaving sufficient only to keep the fish well covered until it is ready to serve; add the remainder of the salt, draw the fish-kettle to the side of the fire, and keep the water _just simmering_, and no more, until the fish is done.

The cook will understand that if a gallon of water be required to cover the fish while it is cooking, that quantity must be made to boil; and that a gallon of cold must be added to it after the fish has been laid in, and _kept boiling_ for a very few minutes. For example:—A large turbot or cod’s head for ten minutes; a moderate-sized plaice or John Dory, about five; and whitings, codlings, and other small fish, from three to four minutes. That one gallon must then be taken out of the kettle, which should immediately be drawn from the fire, and placed at the side of the stove, that the fish may be gradually heated through as the water is brought slowly to the point of simmering.

The whole of the salt may be added after a portion of the water is withdrawn, when the cook cannot entirely depend on her own judgment for the precise quantity required.

Obs.—This is the best _practical_ application that we can give of Baron Liebeg's instructions.

BRINE FOR BOILING FISH.

Fish is exceedingly insipid if sufficient salt be not mixed with the water in which it is boiled, but the precise quantity required for it will depend, in some measure, upon the kind of salt which is used. Fine common salt is that for which our directions are given; but when the Maldon salt, which is very superior in strength, as well as in other qualities, is substituted for it, a smaller quantity must be allowed. About four ounces to the gallon of water will be sufficient for small fish in general; an additional ounce, or rather more, will not be too much for cod fish, lobsters, crabs, prawns, and shrimps; and salmon will require eight ounces, as the brine for this fish should be strong: the water should always be perfectly well skimmed from the moment the scum begins to form upon the surface.

Mackerel, whiting, and other small fish, 4 ounces of salt to a gallon of water. Cod fish, lobsters, crabs, prawns, shrimps, 5 to 6 oz. Salmon, 8 ozs.

TO RENDER BOILED FISH FIRM.

Put a small bit of saltpetre with the salt into the water in which it is boiled: a quarter of an ounce will be sufficient for a gallon.

TO KNOW WHEN FISH IS SUFFICIENTLY BOILED, OR OTHERWISE COOKED.

If the _thickest_ part of the flesh separates easily from the back-bone, it is quite ready to serve, and should be withdrawn from the pan without delay, as further cooking would be injurious to it. This test can easily be applied to a fish which has been divided, but when it is entire it should be lifted from the water when the flesh of the tail breaks from the bone, and the eyes loosen from the head.

TO BAKE FISH.

A gentle oven may be used with advantage, for cooking almost every kind of fish, as we have ascertained from our own observation; but it must be subjected to a mild degree of heat only. This penetrates the flesh gradually, and converts it into wholesome succulent food; whereas, a _hot oven_ evaporates all the juices rapidly, and renders the fish hard and dry. When small, they should be wrapped in oiled or buttered paper before they are baked; and when filleted, or left in any other form, and placed in a deep dish with or without any liquid before they are put into the oven, a buttered paper should still be laid closely upon them to keep the surface moist. Large pieces of salmon, conger eel, and other fish of considerable size are sometimes in common cookery baked like meat over potatoes pared and halved.

FAT FOR FRYING FISH.

This, whether it be butter, lard, or oil should always be excellent in quality, for the finest fish will be rendered unfit for eating if it be fried in fat that is rancid. When good, and used in sufficient quantity, it will serve for the same purpose several times, if strained after each frying, and put carefully away in a clean pan, provided always that it has not been smoked nor burned in the using.

Lard renders fish more crisp than butter does; but fresh, pure olive-oil (_salad oil_, as it is commonly called in England) is the _best_ ingredient which can be used for it, and as it will serve well for the same purpose, many times in succession, if strained and carefully stored as we have already stated, it is not in reality so expensive as might be supposed for this mode of cooking. There should always be an ample quantity of it (or of any other _friture_[44]) in the pan, as the fish should be nearly covered with it, at the least; and it should cease to bubble before either fish or meat is laid into it, or it will be too much absorbed by the flesh, and will impart neither sufficient firmness, nor sufficient colour.

Footnote 44:

The French term for fat of all kinds used in frying.

TO KEEP FISH HOT FOR TABLE.

Never leave it in the water after it is done, but if it cannot be sent to table as soon as it is ready to serve, lift it out, lay the fish-plate into a large and a very hot dish, and set it across the fish-kettle; just dip a clean cloth into the boiling water, and spread it upon the fish, place a tin cover over it, and let it remain so until two or three minutes before it is wanted, then remove the cloth, and put the fish back into the kettle for an instant that it may be as hot as possible: drain, dish, and serve it immediately: the water should be kept boiling the whole time.

TO BOIL A TURBOT.

[In season all the year.]

[Illustration:

Turbot.]

A fine turbot, in full season, and well served, is one of the most delicate and delicious fish that can be sent to table; but it is generally an expensive dish, and its excellence so much depends on the manner in which it is dressed, that great care should be taken to prepare it properly. After it is emptied, wash the inside until it is perfectly cleansed, and rub _lightly_ a little fine salt over the outside, as this will render less washing and handling necessary, by at once taking off the slime; change the water several times, and when the fish is as clean as it is possible to render it, draw a sharp knife through the thickest part of the middle of the back nearly through to the bone.[45] _Never cut off the fins_ of a turbot when preparing it for table, and remember that it is the dark side of the fish in which the incision is to be made, to prevent the skin of the white side from cracking. Dissolve in a well-cleaned turbot or common fish-kettle, in as much cold spring water as will cover the fish abundantly, salt, in the proportion of four ounces to the gallon; wipe the fish-plate with a clean cloth, lay the turbot upon it with the white side upwards, place it in the kettle, bring it slowly to boil, and clear off the scum _thoroughly_ as it rises. Let the water only just simmer until the fish is done, then lift it out, drain, and slide it gently on to a very hot dish, with a hot napkin neatly arranged over the drainer. Send it immediately to table with rich lobster sauce and good plain melted butter. For a simple dinner, anchovy or shrimp sauce is sometimes served with a small turbot. Should there be any cracks in the skin of the fish, branches of curled parsley may be laid lightly over them, or part of the inside coral of a lobster, rubbed through a fine hair-sieve, may be sprinkled over the fish; but it’s better without either, when it is very white and unbroken. When garnishings are in favour, a slice of lemon and a tuft of curled parsley, may be placed alternately round the edge of the dish. A border of fried smelts or of fillets of soles, was formerly served round a turbot, and is always a very admissible addition, though no longer so fashionable as it was. From fifteen to twenty minutes will boil a moderate-sized fish, and from twenty to thirty a large one; but as the same time will not always be sufficient for a fish of the same weight, the cook must watch it attentively, and lift it out as soon as its appearance denotes its being done.

Footnote 45:

This is the common practice even of the _best_ cooks, but is very unscientific nevertheless. When the incision is made really into the flesh the turbot should be cooked altogether on Liebeg’s plan, for which see “The Best Mode of Boiling Fish,” in the preceding pages.

Moderate sized turbot, 15 to 20 minutes. Large, 20 to 30 minutes. Longer, if of unusual size.

Obs.—A lemon gently squeezed, and rubbed over the fish, is thought to preserve its whiteness. Some good cooks still put turbot into _boiling_ water, and to prevent its breaking, tie it with a cloth tightly to the fish-plate.

TURBOT À LA CRÊME.

Raise carefully from the bones the flesh of a cold turbot, and clear it from the dark skin; cut it into small squares, and put it into an exceedingly clean stewpan or saucepan; then make and pour upon it the cream sauce of Chapter V., or make as much as may be required for the fish by the same receipt, with equal proportions of milk and cream and a little additional flour. Heat the turbot slowly in the sauce, but do not allow it to boil, and send it very hot to table. The white skin of the fish is not usually added to this dish, and it is of better appearance without it; but for a family dinner, it may be left on the flesh, when it is much liked. No acid must be stirred to the sauce until the whole is ready for table.

TURBOT AU BÉCHAMEL, OR, IN BÉCHAMEL SAUCE.

Prepare the cold turbot as for the preceding receipt, but leave no portion of the skin with it. Heat it in a rich _bechamel_ sauce, and serve it in a _vol-au-vent_, or in a deep dish with a border of fried bread cut in an elegant form, and made with one dark and one light sippet, placed alternately. The surface may be covered with a half-inch layer of delicately fried bread-crumbs, perfectly well drained and dried; or they may be spread over the fish without being fried, then moistened with clarified butter, and browned with a salamander.

FOR MOULD OF COLD TURBOT WITH SHRIMP CHATNEY, see Chapter VI.

TO BOIL A JOHN DORY.

[In best season from Michaelmas to Christmas, but good all the year.]

[Illustration:

John Dory.]

The John Dory, though of uninviting appearance, is considered by some persons as the most delicious fish that appears at table; in the general estimation, however, it ranks next to the turbot, but it is far less abundant in our markets, and is not commonly to be procured of sufficient size for a handsome dish, except in some few parts of our coast which are celebrated for it. It may easily be known by its yellow gray colour, its one large dark spot on either side, the long filaments on the back, a general thickness of form, and its very ugly head. It is dressed in the same manner, and served usually with the same sauces as a turbot, but requires less time to boil it. The fins should be cut off before it is cooked.

SMALL JOHN DORIES BAKED.

(_Author's Receipt—good._)

We have found these fish when they were too small to be worth cooking in the usual way, excellent when quite simply baked in the following manner, the flesh being remarkably sweet and tender, much more so than it becomes by frying or broiling. After they have been cleaned, dry them in a cloth, season the insides slightly with fine salt, dredge a little flour on the fish, and stick a few very small bits of butter on them, but only just sufficient to prevent their becoming dry in the oven; lay them singly on a flat dish, and bake them very gently from fourteen to sixteen minutes. Serve them with the same sauce as baked soles.

When extremely fresh, as it usually is in the markets of the coast, fish thus simply dressed _au four_ is preferable to that more elaborately prepared by adding various condiments to it after it is placed in a deep dish, and covering it with a thick layer of bread-crumbs, moistened with clarified butter.

The appearance of the John Dories is improved by taking off the heads, and cutting away not only the fins but the filaments of the back.

TO BOIL A BRILL.

A fresh and full-sized brill always ranks high in the list of fish, as it is of good appearance, and the flesh is sweet and delicate. It requires less cooking than the turbot, even when it is of equal size; but otherwise may be dressed and served in a similar manner. It has not the same rich glutinous skin as that fish, nor are the fins esteemed. They must be cut off when the brill is cleaned; and it may be put into nearly boiling water, unless it be very large. Simmer it gently, and drain it well upon the fish-plate when it is lifted out; dish it on a napkin, and send lobster, anchovy, crab, or shrimp sauce to table with it. Lobster coral, rubbed through a sieve, is commonly sprinkled over it for a formal dinner. The most usual garnish for boiled flat fish is curled parsley placed round it in light tufts; how far it is _appropriate_, individual taste must decide.

Brill, moderate-sized, about 20 minutes; large, 30 minutes.

Obs.—The _precise_ time which a fish will require to be boiled cannot be given: it must be watched, and not allowed to remain in the water after it begins to crack.

TO BOIL SALMON.

[In full season from May to August: may be had much earlier, but is scarce and dear.]

To preserve the fine colour of this fish, and to _set the curd_ when it is quite freshly caught, it is usual to put it into _boiling_, instead of into cold water. Scale, empty, and wash it with the greatest nicety, and be especially careful to cleanse all the blood from the inside. Stir into the fish-kettle eight ounces of common salt to the gallon of water, let it boil quickly for a minute or two, take off all the scum, put in the salmon and boil it moderately fast, if it be small, but more gently should it be very thick; and assure yourself that it is quite sufficiently done before it is sent to table, for nothing can be more distasteful, even to the eye, than fish which is under dressed.

From two to three pounds of the thick part of a fine salmon will require half an hour to boil it, but eight or ten pounds will be done enough in little more than double that time; less in proportion to its weight should be allowed for a small fish, or for the thin end of a large one. Do not allow the salmon to remain in the water after it is ready to serve, or both its flavour and appearance will be injured. Dish it on a hot napkin, and send dressed cucumber, and anchovy, shrimp, or lobster sauce, and a tureen of plain melted butter to table with it.

To each gallon water, 8 oz. salt. Salmon, 2 to 3 lbs. (thick), 1/2 hour; 8 to 10 lbs., 1-1/4 hour; small, or thin fish, less time.

SALMON À LA GENEVESE.

A fashionable mode of serving salmon at the present day is to divide the larger portion of the body into three equal parts; to boil them in water, or in a marinade; and to serve them dished in a line, but not close together, and covered with a rich Genevese sauce (for which see Chapter V.) It appears to us that the skin should be stripped from any fish over which the sauce is poured, but in this case it is not customary.

CRIMPED SALMON.

Cut into slices an inch and a half, or two inches thick, the body of a salmon _quite newly caught_; throw them into strong salt and water as they are done, but do not let them soak in it; wash them well, lay them on a fish-plate, and put them into fast boiling water, salted and well skimmed. In from ten to fifteen minutes they will be done. Dish them on a napkin, and send them very hot to table with lobster sauce, and plain melted butter; or with the caper fish-sauce of Chapter V. The water should be salted as for salmon boiled in the ordinary way, and the scum should be cleared off with great care after the fish is in.

In boiling water, 10 to 15 minutes.

SALMON À LA ST. MARCEL.

Separate some cold boiled salmon into flakes, and free them entirely from the skin; break the bones, and boil them in a pint of water for half an hour. Strain off the liquor, put it into a clean saucepan and stir into it by degrees when it begins to boil quickly, two ounces of butter mixed with a large teaspoonful of flour, and when the whole has boiled for two or three minutes add a teaspoonful of essence of anchovies, one of good mushroom catsup, half as much lemon-juice or chili vinegar, a half saltspoonful of pounded mace, some cayenne, and a very little salt. Shell from half to a whole pint of shrimps, add them to the salmon, and heat the fish very slowly in the sauce by the side of the fire, but do not allow it boil. When it is very hot, dish and send it quickly to table. French cooks, when they re-dress fish or meat of any kind, prepare the flesh with great nicety, and then put it into a stewpan, and pour the sauce upon it, which is, we think, better than the more usual English mode of laying it into the boiling sauce. The cold salmon may also be re-heated in the cream sauce of V., or in the _Mâitre d'Hôtel_ sauce which follows it; and will be found excellent with either. This receipt is for a moderate sized dish.

SALMON BAKED OVER MASHED POTATOES.

We are informed by a person who has been a resident in Ireland, that the middle of a salmon is there often baked over mashed potatoes, from which it is raised by means of a wire stand, as meat is in England. We have not been able to have it tried, but an ingenious cook will be at no loss for the proper method of preparing, and the time of cooking it. The potatoes are sometimes merely pared and halved; the fish is then laid upon them.

SALMON PUDDING, TO BE SERVED HOT OR COLD.

(_A Scotch Receipt—Good._)

Pound or chop small, or rub through a sieve one pound of cold boiled salmon freed entirely from bone and skin; and blend it lightly but thoroughly with half a pound of fine bread-crumbs a teaspoonful of essence of anchovies, a quarter of a pint of cream, a seasoning of fine salt and cayenne, and four well whisked eggs. Press the mixture closely and evenly into a deep dish or mould, buttered in every part, and bake it for one hour in a moderate oven.

Salmon, 1 lb.; bread-crumbs, 1/2 lb.; essence of anchovies, 1 teaspoonful; cream, 1/4 pint; eggs, 4; salt and cayenne; baked 1 hour.

TO BOIL COD FISH.

[In highest season from October to the beginning of February; in perfection about Christmas.]

When this fish is large the head and shoulders are sufficient for a handsome dish, and they contain all the choicer portion of it, though not so much substantial eating as the middle of the body, which, in consequence, is generally preferred to them by the frugal housekeeper. Wash the fish, and cleanse the inside, and the back-bone in particular, with the most scrupulous care; lay it into the fish-kettle and cover it well with cold water mixed with five ounces of salt to the gallon, and about a quarter of an ounce of saltpetre to the whole. Place it over a moderate fire, clear off the scum perfectly, and let the fish boil gently until it is done. Drain it well[46] and dish it carefully upon a very hot napkin with the liver and the roe as a garnish. To these are usually added tufts of lightly scraped horseradish round the edge. Serve well-made oyster sauce and plain melted butter with it; or anchovy sauce, when oysters cannot be procured. The cream sauce of Chapter V., is also an appropriate one for this fish.

Footnote 46:

This should be done by setting the fish plate across the kettle for a minute or two.

Moderate size, 20 to 30 minutes. Large, 1/2 to 3/4 hour.

SLICES OF COD FISH FRIED.

Cut the middle or tail of the fish into slices nearly an inch thick, season them with salt and white pepper or cayenne, flour them well, and fry them of a clear equal brown on both sides; drain them on a sieve before the fire, and serve them on a well-heated napkin, with plenty of crisped parsley round them. Or, dip them into beaten egg, and then into fine crumbs mixed with a seasoning of salt and pepper (some cooks add one of minced herbs also), before they are fried. Send melted butter and anchovy sauce to table with them. 8 to 12 minutes.

Obs.—This is a much better way of dressing the thin part of the fish than boiling it, and as it is generally cheap, it makes thus an economical, as well as a very good dish: if the slices are lifted from the frying-pan into a good curried gravy, and left in it by the side of the fire for a few minutes before they are sent to table, they will be found excellent.

STEWED COD.

Put into boiling water, salted as usual, about three pounds of fresh cod fish cut into slices an inch and a half thick, and boil them gently for five minutes; lift them out, and let them drain. Have ready heated in a wide stewpan nearly a pint of veal gravy or of very good broth, lay in the fish, and stew it for five minutes, then add four tablespoonsful of extremely fine bread-crumbs, and simmer it for three minutes longer. Stir well into the sauce a large teaspoonful of arrow-root quite free from lumps, a fourth part as much of mace, something less of cayenne, and a tablespoonful of essence of anchovies, mixed with a glass of white wine and a dessertspoonful of lemon juice. Boil the whole for a couple of minutes, lift out the fish carefully with a slice, pour the sauce over, and serve it quickly.

Cod fish, 3 lbs.: boiled 5 minutes. Gravy, or strong broth, nearly 1 pint: 5 minutes. Bread-crumbs, 4 tablespoonsful: 3 minutes. Arrow-root, 1 large teaspoonful; mace, 1/4 teaspoonful; less of cayenne; essence of anchovies, 1 tablespoonful; lemon-juice, 1 dessertspoonful; sherry or Maidera, 1 wineglassful: 2 minutes.

Obs.—A dozen or two of oysters, bearded, and added with their strained liquor to this dish two or three minutes before it is served, will to many tastes vary it very agreeably.

STEWED COD FISH, IN BROWN SAUCE.

Slice the fish, take off the skin, flour it well, and fry it quickly a fine brown; lift it out and drain it on the back of a sieve, arrange it in a clean stewpan, and pour in as much good boiling brown gravy as will nearly cover it; add from one to two glasses of port wine, or rather more of claret, a dessertspoonful of Chili vinegar, or the juice of half a lemon, and some cayenne, with as much salt as may be needed. Stew the fish very softly until it just begins to break, lift it carefully with a slice into a very hot dish, stir into the gravy an ounce and a half of butter smoothly kneaded with a large teaspoonful of flour, and a little pounded mace, give the sauce a minute's boil, pour it over the fish, and serve it immediately. The wine may be omitted, good shin of beef stock substituted for the gravy, and a teaspoonful of soy, one of essence of anchovies, and two tablespoonsful of Harvey's sauce added to flavour it.

TO BOIL SALT FISH.

When very salt and dry, this must be long soaked before it is boiled, but it is generally supplied by the fishmongers nearly or quite ready to dress. When it is not so, lay it for a night into a large quantity of cold water, then let it lie exposed to the air for some time, then again put it into water, and continue thus until it is well softened. Brush it very clean, wash it thoroughly, and put it with abundance of cold water into the fish kettle, place it near the fire and let it heat very slowly indeed. Keep it just on the point of simmering, without allowing it ever to _boil_ (which would render it hard), from three quarters of an hour to a full hour, according to its weight; should it be quite small and thin, less time will be sufficient for it; but by following these directions, the fish will be almost as good as if it were fresh. The scum should be cleared off with great care from the beginning. Egg sauce and boiled parsneps are the usual accompaniment to salt fish, which should be dished upon a hot napkin, and which is sometimes also thickly strewed with chopped eggs.

SALT FISH, À LA MÂITRE D'HÔTEL.

Boil the fish by the foregoing receipt, or take the remains of that which has been served at table, flake it off clear from the bones, and strip away every morsel of the skin; then lay it into a very clean saucepan or stewpan, and pour upon it the sharp _Mâitre d'Hôtel_ sauce of Chapter IV.; or dissolve gently two or three ounces of butter with four or five spoonsful of water, and a half-teaspoonful of flour; add some pepper or cayenne, very little salt, and a dessertspoonful or more of minced parsley. Heat the fish slowly quite through in either of these sauces, and toss or stir it until the whole is well mixed; if the second be used, add the juice of half a lemon, or a small quantity of Chili vinegar just before it is taken from the fire. The fish thus prepared may be served in a deep dish, with a border of mashed parsneps or potatoes.

TO BOIL CODS' SOUNDS.

Should they be highly salted, soak them for a night, and on the following day rub off entirely the discoloured skin; wash them well, lay them into plenty of cold milk and water, and boil them gently from thirty to forty minutes, or longer should they not be quite tender. Clear off the scum as it rises with great care, or it will sink and adhere to the sounds, of which the appearance will then be spoiled. Drain them well, dish them on a napkin, and send egg sauce and plain melted butter to table with them.

TO FRY CODS' SOUNDS IN BATTER.

Boil them as directed above until they are nearly done, then lift them out, lay them on to a drainer, and let them remain till they are cold; cut them across in strips of an inch deep, curl them round, dip them into a good French or English batter, fry them of a fine pale brown, drain and dry them well, dish them on a hot napkin, and garnish them with crisped parsley.

TO FRY SOLES.

[In season all the year.]

All fish to fry well must be not only fresh but perfectly free from moisture, particularly when they are to be dressed with egg and bread-crumbs, as these will not otherwise adhere to them. Empty, skin, and wash the soles with extreme nicety, from one to two hours before they are wanted for table; and after having cleansed and wiped them very dry both inside and out, replace the roes, fold and press them gently in a soft clean cloth, and leave them wrapped in it until it is time to fry them; or suspend them singly upon hooks in a current of cool air, which is, perhaps, the better method of proceeding when it can be done conveniently. Cover them equally in every part, first with some beaten egg, and then with fine dry crumbs of bread, mixed with a _very little_ flour to make them adhere with more certainty: a small teaspoonful will be sufficient for two large soles. Melt in a large and exceedingly clean frying pan over a brisk and clear fire, as much very pure-flavoured lard as will float the fish, and let it be sufficiently hot before

they are laid in to brown them quickly; for if this be neglected it will be impossible to render them crisp or dry. When the fat ceases to bubble, throw in a small bit of bread, and if it takes a good colour immediately the soles may be put in without delay. An experienced cook will know, without this test, when it is at the proper point; but the learner will do better to avail herself of it until practice and observation shall have rendered it unnecessary to her. Before the fish are laid into the pan, take them by the head and shake the loose crumbs from them. When they are firm, and of a fine amber-colour on one side, turn them with care, passing a slice under them and a fork through the heads, and brown them on the other. Lift them out, and either dry them well on a soft cloth laid upon a sieve reversed, before the fire, turning them often, or press them lightly in hot white blotting paper. Dish them on a drainer covered with a hot napkin and send them to table without delay with shrimp or anchovy sauce, and plain melted butter.

Very small soles will be done in six minutes, and large ones in about ten. They may be floured and fried, without being egged and crumbed, but this is not a very usual mode of serving them.

Small soles, 6 minutes; large, about 10 minutes.

TO BOIL SOLES.

The flesh of a fine fresh sole, when boiled with care, is remarkably sweet and delicate: if very large it may be dressed and served as turbot, to which it will be found little inferior in flavour. Empty it, take out the gills, cut off the fins, and cleanse and wash it with great nicety, but do not skin it; then either lay it into cold water in which the usual proportion of salt has been dissolved, and heat it rather slowly, and then simmer it from five to ten minutes, according to its size; or boil it in the manner directed in the first pages of this chapter. Drain it well on the fish-plate as it is lifted out, and dish it on a napkin, the white side upwards, and serve it quickly with anchovy, shrimp, or lobster sauce. It may also be sent to table thickly covered with the Cream Fish Sauce, Caper Fish Sauce, or Lady’s Sauce, of Chapter VI.; though this is a mode of service less to be recommended, as the sauce cools more speedily when spread over the surface of the fish: it is, however, the continental fashion, and will therefore find more favour with some persons.

Very large sole, 5 to 10 minutes; moderate sized, 4 to 6 minutes.

FILLETS OF SOLES.

The word _fillet_, whether applied to fish, poultry, game, or butcher’s meat, means simply the flesh of either (or of certain portions of it), raised clear from the bones in a handsome form, and divided or not, as the manner in which it is to be served may require. It is an elegant mode of dressing various kinds of fish, and even those which are not the most highly esteemed, afford an excellent dish when thus prepared. Soles to be filletted with advantage should be large; the flesh may then be divided down the middle of the back, next, separated from the fins, and with a very sharp knife raised clear from the bones.[47] When thus prepared, the fillets may be divided, trimmed into a good form, egged, covered with fine crumbs, fried in the usual way, and served with the same sauces as the whole fish; or each fillet may be rolled up, in its entire length, if very small, or after being once divided if large, and fastened with a slight twine, or a short thin skewer; then egged, crumbed, and fried in plenty of boiling lard; or merely well floured and fried from eight to ten minutes. When the fish are not very large, they are sometimes boned without being parted in the middle, and each side is rolled from the tail to the head, after being first spread with pounded shrimps mixed with a third of their volume of butter, a few bread-crumbs, and a high seasoning of mace and cayenne; or with pounded lobster mixed with a large portion of the coral, and the same seasoning, and proportion of butter as the shrimps; then laid into a dish, with the ingredients directed for the _soles au plat_; well covered with crumbs of bread and clarified butter, and baked from twelve to sixteen minutes, or until the crumbs are coloured to a fine brown in a moderate oven.

Footnote 47:

A celebrated French cook gives the following instructions for raising these fillets:—“them up by running your knife first between the bones and the flesh, then between the skin and the fillet; by leaning pretty hard on the table they will come off very neatly.”

The fillets may likewise be cut into small strips or squares of uniform size, lightly dredged with pepper or cayenne, salt and flour, and fried in butter over a brisk fire; then well drained, and sauced with a good _béchamel_, flavoured with a teaspoonful of minced parsley.

SOLES AU PLAT.

Clarify from two to three ounces of fresh butter, and pour it into the dish in which the fish are to be served; add to it a little salt, some cayenne, a teaspoonful of essence of anchovies, and from one to two glasses of sherry, or of any other dry white wine; lay in a couple of fine soles which have been well cleaned and wiped very dry, strew over them a thick layer of fine bread-crumbs, moisten them with clarified butter, set the dish into a moderate oven, and bake the fish for a quarter of an hour. A layer of shrimps placed between the soles is a great improvement; and we would also recommend a little lemon-juice to be mixed with the sauce.

Baked, 15 minutes.

Obs.—The soles are, we think, better without the wine in this receipt. They require but a small portion of liquid, which might be supplied by a little additional butter, a spoonful of water or pale gravy, the lemon-juice, and store-sauce. Minced parsley may be mixed with the bread-crumbs when it is liked.

BAKED SOLES.

(_A simple but excellent Receipt._)

Fresh large soles, dressed in the following manner, are remarkably tender and delicate eating; much more so than those which are fried. After the fish has been skinned and cleansed in the usual way, wipe it dry, and let it remain for an hour or more, if time will permit, closely folded in a clean cloth; then mix with a slightly beaten egg about an ounce of butter, just liquefied but not _heated_ at the mouth of the oven, or before the fire; brush the fish in every part with this mixture, and cover it with very fine dry bread-crumbs, seasoned with a little salt, cayenne, pounded mace, and nutmeg. Pour a teaspoonful or two of liquid butter into a flat dish which will contain the fish well; lay it in, sprinkle it with a little more butter, press the bread-crumbs lightly on it with a broad-bladed knife, and bake it in a moderate oven for about twenty minutes. If two or more soles are required for table at the same time, they should be placed separately, quite flat, in a large dish, or each fish should be laid on a dish by itself. On our first essay of this receipt, the fish dressed by it (it was baked for twenty-five minutes in a very slack iron oven) proved infinitely nicer than one of the same size which was fried, and served with it. The difference between them was very marked, especially as regarded the exceeding tenderness of the flesh of that which was baked; its appearance, however, would have been somewhat improved by a rather quicker oven. When ready to serve, it should be gently glided on to the dish in which it is to be sent to table. About three ounces of bread-crumbs, and two and a half of butter, will be sufficient for a large pair of soles. They will be more perfectly encrusted with the bread if dipped into, or sprinkled with it a second time, after the first coating has been well moistened with the butter.

SOLES STEWED IN CREAM.

Prepare some very fresh middling sized soles with exceeding nicety, put them into boiling water slightly salted, and simmer them for two minutes only; lift them out, and let them drain; lay them into a wide stewpan with as much sweet rich cream as will nearly cover them; add a good seasoning of pounded mace, cayenne, and salt; stew the fish softly from six to ten minutes, or until the flesh parts readily from the bones; dish them, stir the juice of half a lemon to the sauce, pour it over the soles, and send them immediately to table. Some lemon-rind may be boiled in the cream, if approved; and a small teaspoonful of arrow-root, very smoothly mixed with a little milk, may be stirred to the sauce (should it require thickening) before the lemon-juice is added. Turbot and brill also may be dressed by this receipt, time proportioned to their size being of course allowed for them.

Soles, 3 or 4: boiled in water 2 minutes. Cream, 1/2 to whole pint; salt, mace, cayenne: fish stewed, 6 to 10 minutes. Juice of half a lemon.

Obs.—In Cornwall the fish is laid at once into thick clotted cream, and stewed entirely in it; but this method gives to the sauce, which ought to be extremely delicate, a coarse fishy flavour which the previous boil in water prevents.

At Penzance, grey mullet, after being scaled, are divided in the middle, just covered with cold water, and softly boiled, with the addition of branches of parsley, pepper and salt, until the flesh of the back parts easily from the bone; clotted cream, minced parsley, and lemon-juice are then added to the sauce, and the mullets are dished with the heads and tails laid even to the thick parts of the back, where the fish were cut asunder. Hake, too, is there divided at every joint (having previously been scaled), dipped into egg, then thickly covered with fine bread-crumbs mixed with plenty of minced parsley, and fried a fine brown; or, the back-bone being previously taken out, the fish is sliced into cutlets, and then fried.

TO FRY WHITINGS.

[In full season from Michaelmas to beginning of February.]

Clean, skin, and dry them thoroughly in a cloth, fasten their tails to their mouths, brush slightly beaten eggs equally over them, and cover them with the finest bread-crumbs, mixed with a little flour; fry them a clear golden brown in plenty of boiling lard, drain and dry them well, dish them on a hot napkin, and serve them with good melted butter, and the sauce cruets, or with well made shrimp or anchovy sauce. A small half-teaspoonful of salt should be beaten up with the eggs used in preparing the whitings: two will be sufficient for half a dozen fish.

5 to 8 minutes, according to their size.

FILLETS OF WHITINGS.

Empty and wash thoroughly, but do not skin the fish. Take off the flesh on both sides close to the bones, passing the knife from the tail to the head; divide each side in two, trim the fillets into good shape, and fold them in a cloth, that the moisture may be well absorbed from them; dip them into, or draw them through, some beaten egg, then dip them into fine crumbs mixed with a small portion of flour, and fry them a fine light brown in lard or clarified butter; drain them well, press them in white blotting-paper, dish them one over the other in a circle, and send the usual sauce to table with them. The fillets may also be broiled after being dipped into eggs seasoned with salt and pepper, then into crumbs of bread, next into clarified butter, and a second time into the bread-crumbs (or, to shorten the process, a portion of clarified butter may be mixed with the eggs at first), and served with good melted butter, or thickened veal gravy seasoned with cayenne, lemon-juice, and chopped parsley.

Five minutes will fry the fillets, even when very large rather more time will be required to broil them.

TO BOIL WHITINGS.

(_French Receipt_)

Having scraped, cleansed, and wiped them, lay them on a fish-plate, and put them into water at the point of boiling; throw in a handful of salt, two bay leaves, and plenty of parsley well washed and tied together; let the fish _just simmer_ from five to ten minutes, and watch them closely that they may not be overdone. Serve parsley and butter with them, and use in making it the liquor in which the whitings have been boiled.

Just simmered from 5 to 10 minutes.

BAKED WHITINGS À LA FRANÇAISE.

Proceed with these exactly as with the _soles au plat_ of this chapter; or, pour a little clarified butter into a deep dish, and strew it rather thickly with finely-minced mushrooms mixed with a teaspoonful of parsley, and (when the flavour is liked, and considered appropriate) with an eschalot or two, or the white part of a few green onions, also chopped very small. On these place the fish after they have been scaled, emptied, thoroughly washed, and wiped dry: season them well with salt and white pepper, or cayenne; sprinkle more of the herbs upon them; pour gently from one to two glasses of light white wine into the dish, cover the whitings with a thick layer of fine crumbs of bread, sprinkle these plentifully with clarified butter, and bake the fish from fifteen to twenty minutes. Send a cut lemon only to table with them. When the wine is not liked, a few spoonsful of pale veal gravy can be used instead; or a larger quantity of clarified butter, with a tablespoonful of water, a teaspoonful of lemon-pickle and of mushroom catsup, and a few drops of soy.

15 to 20 minutes.

TO BOIL MACKEREL.

[In full season in May, June, and July; may be had also in early spring.]

[Illustration:

Mackerel.]

Open the fish sufficiently to admit of the insides being _perfectly cleansed_, but not more than is necessary for this purpose; empty them with care, lay the roes apart, and wash both them and the mackerel delicately clean. It is customary now to lay these, and the

greater number of other fish as well, into cold water when they are to be boiled; formerly all were plunged at once into fast-boiling water. For such as are small and delicate, it should be hot; they should be brought gently to boil, and simmered until they are done; the scum should be cleared off as it rises, and the usual proportion of salt stirred into the water before the mackerel are put in. The roes are commonly replaced in the fish; but as they sometimes require more boiling than the mackerel themselves, it is better, when they are very large, to lay them upon the fish-plate by their sides. From fifteen to twenty minutes will generally be sufficient to boil a full-sized mackerel some will be done in less time; but they must be watched and lifted out as soon as the tails split, and the eyes are starting.

Dish them on a napkin, and send fennel or gooseberry sauce to table with them, and plain melted butter also.

Small mackerel, 10 to 15 minutes; large, 15 to 20 minutes.

TO BAKE MACKEREL.

After they have been cleaned and well washed, wipe them very dry, fill the insides with the forcemeat, No. 1 of Chapter VIII., sew them up, arrange them, with the roes, closely together in a coarse baking-dish, flour them lightly, strew a little fine salt over, and stick bits of butter upon them; or pour some equally over them, after having just dissolved it in a small saucepan. Half an hour in a moderate oven will bake them. Oyster forcemeat is always appropriate for any kind of fish which is in season while the oysters are so; but the mackerel are commonly served, and are very good with that which we have named. Lift them carefully into a hot dish after they are taken from the oven, and send melted butter and a cut lemon to table with them.

1/2 hour.

BAKED MACKEREL, OR WHITINGS.

(_Cinderella's Receipt—good._)

The fish for this receipt should be opened only so much as will permit of their being emptied and perfectly cleansed. Wash and wipe them dry, then fold them in a soft cloth, and let them remain in it awhile. Replace the roes, and put the fish into a baking-dish of suitable size, with a tablespoonful of wine, a few drops of chili vinegar, a little salt and cayenne, and about half an ounce of butter, well-blended with a saltspoonful of flour, for each fish. They must be turned round with the heads and tails towards each other, that they may lie compactly in the dish, and the backs should be placed downwards, that the sauce may surround the thickest part of the flesh. Lay two buttered papers over, and press them down upon them; set the dish into a gentle oven for twenty minutes, take off the papers, and send the fish to table in their sauce.

A few minutes more of time must be allowed for mackerel when it is large, should the oven be _very_ slow.

Full-sized whitings are _excellent_ thus dressed if carefully managed, and many eaters would infinitely prefer mackerel so prepared, to boiled ones. The writer has port-wine always used for the sauce, to which a rather full seasoning of chili vinegar, cayenne, and pounded mace, is added; but sherry, Bucellas, or any other dry wine, can be used instead; and the various condiments added to it, can be varied to the taste. This receipt is a very convenient one, as it is prepared with little trouble, and a stove-oven, if the heat be properly moderated, will answer for the baking. It is an advantage to take off the heads of the fish before they are dressed, and they may then be entirely emptied without being opened. When preferred so, they can be re-dished for table, and the sauce poured over them.

Obs.—The dish in which they are baked, should be buttered before they are laid in.

FRIED MACKEREL.

(_Common French Receipt._)

After the fish have been emptied and washed extremely clean, cut off the heads and tails, split the bodies quite open, and take out the backbones (we recommend in preference that the flesh should be taken off the bones as in the following receipt), wipe the mackerel very dry, dust fine salt and pepper (or cayenne) over them, flour them well, fry them a fine brown in boiling lard, drain them thoroughly, and serve them with the following sauce:—Dissolve in a small saucepan an ounce and a half of butter smoothly mixed with a teaspoonful of flour, some salt, pepper, or cayenne; shake these over a gentle fire until they are lightly coloured, then add by slow degrees nearly half a pint of good broth or gravy, and the juice of one large lemon; boil the sauce for a couple of

minutes, and serve it very hot. Or, instead of this, add a large teaspoonful of strong made mustard, and a dessertspoonful of chili vinegar, to some thick melted butter, and serve it with the fish. A spoonful of Harvey's sauce or of mushroom catsup can be mixed with this last at pleasure.

FILLETS OF MACKEREL.

(_Fried or Broiled._)

Take off the flesh quite whole on either side, from three fine mackerel, which have been opened and properly cleaned; let it be entirely free from bone, dry it well in a cloth, then divide each part in two, and dip them into the beaten yolks of a couple of eggs, seasoned with salt and white pepper, or cayenne; cover them equally with fine dry crumbs of bread, and fry them like soles; or dip them into clarified butter, and then again into the crumbs, and broil them over a very clear fire of a fine brown. Dish them in a circle one over the other, and send them to table with the _Mâitre d'Hôtel_ sauce of Chapter V., or with the one which follows it. The French pour the sauce into the centre of the dish; but for broiled fillets this is not so well, we think, as serving it in a tureen. The roes of the fish, after being well washed and soaked, may be dressed with them, or they may be made into patties. Minced parsley can be mixed with the bread-crumbs when it is liked.

BOILED FILLETS OF MACKEREL.

After having taken off and divided the flesh of the fish, as above, place it flat in one layer in a wide stewpan or saucepan, and just cover the fillets with cold water; throw in a teaspoonful of salt, and two or three small sprigs of parsley; bring the mackerel slowly to a boil, clear off the scum with care, and after two or three minutes of slow simmering try the fillets with a fork; if the thick part divides with a touch, they are done. Lift them out cautiously with a slice; drain, and serve them very hot with good parsley and butter; or strip off the skin quickly, and pour a _Mâitre d'Hôtel_ sauce over them.

MACKEREL BROILED WHOLE.

(_An excellent Receipt._)

Empty and cleanse perfectly a fine and very fresh mackerel, but without opening it more than is needful; dry it well, either in a cloth or by hanging it in a cool air until it is stiff; make with a sharp knife a deep incision the whole length of the fish on either side of the back bone, and about half an inch from it, and with a feather put in a little cayenne and fine salt, mixed with a few drops of good salad oil or clarified butter. Lay the mackerel over a moderate fire upon a well-heated gridiron which has been rubbed with suet; loosen it gently should it stick, which it will do unless often moved; and when it is equally done on both sides, turn the back to the fire. About half an hour will broil it well. If a sheet of thickly-buttered writing-paper be folded round it, and just twisted at the ends before it is laid on the gridiron, it will be finer eating than if exposed to the fire; but sometimes when this is done, the skin will adhere to the paper, and be drawn off with it, which injures its appearance. A cold _Mâitre d'Hôtel_ sauce (see Chapter V.), may be put into the back before it is sent to table. This is one of the very best modes of dressing a mackerel, which in flavour is quite a different fish when thus prepared to one which is simply boiled. A drop of oil is sometimes passed over the skin to prevent its sticking to the iron. It may be laid to the fire after having been merely cut as we have directed, when it is preferred so.

30 minutes; 25 if _small_.

MACKEREL STEWED WITH WINE.

(_Very good._)

Work very smoothly together a large teaspoonful of flour with two ounces of butter, put them into a stewpan, and stir or shake them round over the fire until the butter is dissolved; add a quarter of a teaspoonful of mace, twice as much salt, and some cayenne; pour in by slow degrees three glasses of claret; and when the sauce boils, lay in a couple of fine mackerel well cleaned, and wiped quite dry; stew them very softly from fifteen to twenty minutes, and turn them when half done; lift them out, and dish them carefully; stir a teaspoonful of made mustard to the sauce, give it a boil, and pour it over the fish. When more convenient, substitute port wine and a little lemon-juice, for the claret.

Mackerel, 2; flour, 1 teaspoonful; butter, 2 oz.; seasoning of salt, mace, and cayenne; claret, 3 wineglassesful; made mustard, 1 teaspoonful: 15 to 20 minutes.

FILLETS OF MACKEREL STEWED IN WINE.

(_Excellent._)

Raise the flesh entire from the bones on either side of the mackerel, and divide it once, if the fish be small, but cut the whole into six parts of equal size should they be large. Mix with flour, and dissolve the butter as in the preceding receipt; and when it has simmered for a minute, throw in the spice, a little salt, and the thinly pared rind of half a small fresh lemon, lay in the fillets of fish, shake them over a gentle fire from four to five minutes, and turn them once in the time; then pour to them in small portions a couple of large wineglassesful of port wine, a tablespoonful of Harvey's sauce, a teaspoonful of soy, and one of lemon-juice; stew the mackerel very softly until the thinner parts begin to break, lift them out with care, dish and serve them in their sauce as hot as possible. We can recommend the dish to our readers as a very excellent one. A garnish of fried sippets can be placed round the fish at will. A teaspoonful of made mustard should be stirred to the sauce before it is poured over the fish.

Fillets of mackerel, 2; butter, 2 oz.; flour, 1 teaspoonful; rind of 1/2 lemon; salt, cayenne, pounded mace: 2 minutes. Fish, 4 to 5 minutes. Port wine, two large glassesful; Harvey's sauce, 1 tablespoonful; soy and lemon-juice each, 1 teaspoonful: 4 to 6 minutes. Mustard, 1 teaspoonful.

Obs.—Trout may be dressed by this receipt.

TO BOIL HADDOCKS.

In the best season in October, November, and December.

[Illustration:

Haddock.]

Scrape the outsides very clean, open the fish, empty them, wash the insides thoroughly, take out the gillet, curl the haddocks round, fasten the tails to the mouths, arrange them on a fish-plate, and lay them into hot water salted as for mackerel. Take off all the scum, and simmer them from seven to ten minutes or longer, according to their size, which, as we have said in the directions for "the best mode of cooking various kind of fish," at the commencement of this chapter, varies greatly, as they are sometimes very large; they must then be brought more slowly to boil, and more time must be allowed for them. Send them very hot to table, with a tureen of melted butter, and one of anchovy sauce.

7 to 10 minutes.

Obs.—In Scotland haddocks are skinned before they are boiled, and the heads are taken off; but we see no advantage in this mode of dressing them. Whitings, fresh herrings, and codlings, may all be dressed by this receipt, the time only being varied according to the size of the fish.

BAKED HADDOCKS

After they have been cleaned, dry them thoroughly, then bake them, as directed in the common receipt for pike, or fill them with oyster forcemeat, or with No. 1 of Chapter VIII., if more convenient, and proceed as for baked mackerel.

20 to 30 minutes; longer if very large.

TO FRY HADDOCKS

Follow the directions given for fillets of whitings; or, should a more simple method be preferred, clean and dry the fish well, cut off the heads and tails, take out the backbones, cut each fish in three, egg and crumb them, fry them in boiling lard a fine golden brown, and serve them, well drained and dried, with the same sauces as boiled haddocks.

TO DRESS FINNAN HADDOCKS.

These are slightly salted and dried. They are excellent eating, if gently heated through upon the gridiron without being hardened; and are served usually at the breakfast or supper table; a feather dipped in oil may be passed over them before they are laid to the fire.

TO BOIL GURNARDS.

(_With directions for dressing them in other ways._)

[Illustration:

Gurnard.]

It is more usual to fill gurnards with forcemeat, and to bake them, or to have the flesh raised from the bones and dressed in fillets, than to serve them simply boiled; they may, however, be cooked in any of the modes directed for mackerel,[48] rather more time being allowed for them, as they are much firmer-fleshed, thicker in the bodies, and generally of larger size altogether. Cut off all the fins, take out the gills, and empty and cleanse them like other fish, washing the insides well; put them into hot water ready salted and skimmed, and boil them gently from twenty minutes to half an hour; serve them with anchovy sauce, or with parsley and butter rendered acid with chili vinegar, lemon-juice, or caper-pickle.

Footnote 48:

Whitings or haddocks.

FRESH HERRINGS.

(_Farleigh Receipt._)

In season from May to October.

Scale and clean the fish with the utmost nicety, split them quite open, and wash the insides with particular care; dry them well in a cloth, take off the heads and tails, and remove the backbones; rub the insides with pepper, salt, and a little pounded mace; stick small bits of butter on them, and skewer two of the fish together as flat as possible, with the skin of both outside; flour, and broil or fry them of a fine brown, and serve them with melted butter mixed with a teaspoonful or more of mustard, some salt, and a little vinegar or lemon-juice.

To broil from 20 to 25 minutes; to fry about 10 minutes.

TO DRESS THE SEA BREAM.

[Illustration:

Sea Bream.]

The sea-bream, which is common in many of our markets, is not considered a fish of first-rate quality; but if well broiled or baked, it will afford a good, and generally a _cheap_, dish of excellent appearance, the bream being of handsome size and form. Open and cleanse it perfectly, but do not remove the scales; fold it in a dry cloth to absorb the moisture which hangs about it; lay it over a gentle fire, and broil it slowly, that the heat may gradually penetrate the flesh, which is thick. Should any cracks appear on the surface, dredge a little flour upon them. If of ordinary weight, the bream will require quite half an hour’s broiling; it should be turned, of course, when partially done. Send plain melted butter and anchovy sauce to table with it. In carving it, remove the skin and scales, and serve only the flesh which lies beneath them, and which will be very white and succulent. A more usual and less troublesome mode of dressing the bream is to season the inside slightly with salt and pepper or cayenne, to dust a little more salt on the outside, spread a few bits of butter upon it, and send it to a gentle oven. It is sometimes filled with common veal-stuffing, and then requires to be rather longer baked; and it is often merely wrapped in a buttered paper, and placed in a moderate oven for twenty-five or thirty minutes.

TO BOIL PLAICE OR FLOUNDERS.

Plaice in season from May to January; flounders in September, October, and November.

[Illustration:

Plaice.]

After having emptied and well cleaned the fish, make an incision in the back as directed for turbot; lay them into cold spring water; add salt and saltpetre in the same proportion as for cod fish, and let them just simmer for four or five minutes after the water first begins to boil, or longer should their size require it, but guard against their being broken. Serve them with plain melted butter. 4 to 5 minutes; longer if needful.

TO FRY PLAICE OR FLOUNDERS.

Sprinkle them with salt, and let them lie for two or three hours before they are dressed. Wash and clean them thoroughly, wipe them very dry, flour them well, and wipe them again with a clean cloth; dip them into egg, and fine bread-crumbs, and fry them in plenty of lard. If the fish be large, raise the flesh in handsome fillets from the bones, and finish them as directed for fillets of soles. _Obs._—Plaice is said to be rendered less watery by beating it gently with a paste-roller before it is cooked. It is very sweet and pleasant in flavour while it is in the best season, which is from the end of May to about September.

TO ROAST, BAKE, OR BROIL RED MULLET.

[In best season through the summer: may be had all the year.]

[Illustration:

Red Mullet.]

First wash and then dry the fish thoroughly in a cloth, but neither scale nor open it, but take out the gills gently and carefully with the small intestine which will adhere to them; wrap it closely in a sheet of thickly buttered paper, tie this securely at the ends, and over the mullet with packthread, and roast it in a Dutch oven, or broil it over a clear and gentle fire, or bake it in a moderate oven: from twenty to twenty-five minutes will be sufficient generally to dress it in either way. For sauce, put into a little good melted butter the liquor which has flowed from the fish, a small dessertspoonful of essence of anchovies, some cayenne, a glass of port wine, or claret, and a little lemon-juice. Remove the packthread, and send the mullet to table in the paper case. This is the usual mode of serving it, but it is dished without the paper for dinners of taste. _The plain red mullet_, shown at the commencement of this receipt, is scarcely ever found upon our coast. That which abounds here during the summer months is the striped red mullet, or _surmullet_, which, from its excellence, is always in request, and is therefore seldom cheap. It rarely exceeds twelve, or at the utmost fourteen, inches in length.

20 to 30 minutes.

TO BOIL GREY MULLET.

[Illustration:

Grey Mullet.]

This fish varies so much in size and quality, that it is difficult to give exact directions for the time of cooking it. When quite young and small, it may be boiled by the receipt for whitings, haddocks, and other fish of about their size; but at its finest growth it must be laid into cold water, and managed like larger fish. We have ourselves partaken of one which was caught upon our eastern coast, that weighed ten pounds, of which the flesh was quite equal to that of salmon, but its weight was, we believe, an unusual one. Anchovy, or caper fish sauce, with melted butter, may be sent to table with grey mullet.

THE GAR-FISH.

[Illustration:

Gar-Fish.]

This is a fish of very singular appearance, elongated in form, and with a mouth which resembles the bill of the snipe, from which circumstance it is often called the snipe-fish. Its bones are all of a _bright green_ colour. It is not to be recommended for the table, as the skin contains an oil of exceedingly strong rank flavour; when entirely divested of this, the flesh is tolerably sweet and palatable. Persons who may be disposed from curiosity to taste it will find either broiling or baking in a gentle oven the best mode of cooking it. It should be curled round, and the tail fastened into the bill. As it is not of large size, from fifteen to twenty minutes will

dress it sufficiently. Anchovy sauce, parsley and butter, or plain melted butter, may be eaten with it.

SAND-LAUNCE, OR, SAND-EEL.

[Illustration:

Sand-Eel.]

The sand-launce, which is abundant on many parts of our coast, and the name of which is derived from its habit of burrowing in the sands when the tide retires, may be distinguished from the larger species, the true _sand-eel_, by its lighter colour and more transparent appearance, as well as by its inferior size. The common mode of dressing the fish, which is considered by many a great delicacy, is to divest them of their heads, and to remove the insides with the gills, to dry them well in a cloth with flour, and to fry them until crisp. They are sometimes also dipped in batter like smelts. We have not ourselves had an opportunity of testing them, but we have received the particulars which we have given here from various friends who have resided where they were plentiful. The _sand-eels_ are not so good as the smaller kind of these fish called _launces_.

TO FRY SMELTS.

[In season from beginning of November to May.]

Smelts when quite fresh have a perfume resembling that of a cucumber, and a peculiarly delicate and agreeable flavour when dressed. Draw them at the gills, as they must not be opened; wash and dry them thoroughly in a cloth; dip them into beaten egg-yolk, and then into the finest bread-crumbs, mixed with a very small quantity of flour; fry them of a clear golden brown, and serve them crisp and dry, with good melted butter in a tureen. They are sometimes dipped into batter and then fried; when this is done, we would recommend for them the French batter of Chapter V.

3 to 4 minutes.

BAKED SMELTS.

Prepare them as for frying; pour some clarified butter into the dish in which they are to be sent to table, arrange them neatly in it, with the tails meeting in the centre, strew over them as much salt, mace, and cayenne, mixed, as will season them agreeably, cover them smoothly with a rather thick layer of very fine bread-crumbs, moisten them equally with clarified butter poured through a small strainer, and bake the fish in a moderately quick oven, until the crumbs are of a fine light brown. A glass of sherry, half a teaspoonful of essence of anchovies, and a dessertspoonful of lemon-juice, are sometimes poured into the dish before the smelts are laid in.

About 10 minutes.

TO DRESS WHITE BAIT.

(_Greenwich Receipt._)

[In season in July, August, and September.]

This delicate little fish requires great care to dress it well. Do not touch it with the hands, but throw it from your dish or basket into a cloth, with three or four handsful of flour, and shake it well; then put it into a bait sieve, to separate it from the superfluous flour. Have ready a very deep frying-pan, nearly full of boiling fat, throw in the fish, which will be done in an instant: they must not be allowed to take any colour, for if browned, they are spoiled. Lift them out, and dish them upon a silver or earthenware drainer, without a napkin, piling them very high in the centre. Send them to table with a cut lemon, and slices of brown bread and butter.

WATER SOUCHY.

(_Greenwich Receipt._)

This is a very simple and inexpensive dish, much served at the regular fish-dinners for which Greenwich is celebrated, as well as at private tables. It is excellent if well prepared; and as it may be made with fish of various kinds when they are too small to present a good appearance or to be palatable dressed in any other way, it is also very economical. Flounders, perch, tench, and eels, are

said to answer best for water souchy; but very delicate soles, and several other varieties of small white fish are often used for it with good effect: it is often made also with slices of salmon, or of salmon-peel, freed from the skin.

Throw into rather more than sufficient water to just cover the quantity of fish required for table, from half to three quarters of an ounce of salt to the quart, a dozen corns of white pepper, a small bunch of green parsley, and two or three tender parsley roots, first cut into inch lengths, and then split to the size of straws. Simmer the mixture until these last are tender, which will be in from half to a whole hour; then lay in the fish delicately cleaned, cleared from every morsel of brown skin, and divided into equal portions of about two inches in width. Take off all the scum as it rises, and stew the fish softly from eight to twelve minutes, watching it that it may not break from being overdone.

Two minutes before it is dished, strew in a large tablespoonful or more of minced parsley, or some small branches of the herb boiled very green in a separate saucepan (we prefer the latter mode); lift out the fish carefully with a slice, and the parsley roots with it; pour over it the liquor in which it has been boiled, but leave out the peppercorns. For a superior water souchy, take all the bones out of the fish, and stew down the inferior portions of it to a strong broth: about an hour will be sufficient for this. Salt, parsley, and a little cayenne may be added to it. Strain it off clear through a sieve, and use it instead of water for the souchy. The juice of half a good lemon may be thrown into the stew before it is served. A deep dish will of course be required for it. The parsley-roots can be boiled apart when more convenient, but they give an agreeable flavour when added to the liquor at first. Slices of brown or white bread and butter must be sent to table always with water souchy: the first is usually preferred, but to suit all tastes some of each may be served with it.

SHAD, TOURAINE FASHION.

(_Alose à la mode de Touraine._)

[In season in April, May, and early part of June.]

Empty and wash the fish with care, but do not open it more than is needful; fill it either with the forcemeat No. 1, or No. 2 of Chapter VIII., and its own roe; then sew it up, or fasten it securely with very fine skewers, wrap it in a thickly buttered paper, and broil it gently for an hour over a charcoal fire. Serve it with caper sauce, or with chili vinegar and melted butter.

We are indebted for this receipt to a friend who has been long resident in Touraine, at whose table the fish is constantly served thus dressed, and is considered excellent. It is likewise often gently stewed in the light white wine of the country, and served covered with a rich _béchamel_. Many fish more common with us than the shad might be advantageously prepared in the same manner. The charcoal fire is not indispensable: any one that is entirely free from smoke will answer. We would suggest as an improvement, that oyster-forcemeat should be substituted for that which we have indicated, until the oyster season ends.

Broiled gently, 1 hour, more or less, according to the size.

STEWED TROUT.

(_Good common Receipt._)

[In season from May to August.]

[Illustration:

Trout.]

Melt three ounces of butter in a broad stewpan, or well tinned iron saucepan, stir to it a tablespoonful of flour, some mace, cayenne, and nutmeg; lay in the fish after it has been emptied, washed very clean, and wiped perfectly dry; shake it in the pan, that it may not stick, and when lightly browned on both sides, pour in three quarters of a pint of good veal stock, add a small faggot of parsley, one bay leaf, a roll of lemon-peel, and a little salt: stew the fish _very gently_ from half to three quarters of an hour, or more, should it be unusually fine. Dish the trout, skim the fat from the gravy, and pass it through a hot strainer over the fish, which should be served immediately. A little acid can be added to the sauce at pleasure, and a glass of wine when it is considered an improvement. This receipt is for one large or for two middling-sized fish. We can recommend it as a good one from our own experience.

Butter, 3 oz.; flour, 1 tablespoonful; seasoning of mace, cayenne, and nutmeg; trout, 1 large, or 2 moderate-sized; veal stock, 3/4 pint; parsley, _small_ faggot; 1 bay-leaf; roll of lemon-rind; little salt: 1/2 to 3/4 hour.

Obs.—Trout may be stewed in equal parts of strong veal gravy, and of red or white wine, without having been previously browned; the sauce should then be thickened, and agreeably flavoured with lemon-juice, and the usual store-sauces, before it is poured over the fish. They are also good when wrapped in buttered paper, and baked or broiled: if very small, the better mode of cooking them is to fry them whole. They should never be plain boiled, as, though naturally a delicious fish, they are then very insipid.

TO BOIL PIKE.

[In best season from September to February.]

[Illustration:

Pike.]

Take out the gills, empty and clean the fish very thoroughly, and soak it for half an hour with a cup of vinegar thrown into as much water as will cover it well, should there be any danger of its having a muddy taste.[49] Wipe the inside dry, and fill it with oyster-forcemeat, or with common veal forcemeat made either with butter or with suet (for which see Chapter VIII.); curl the fish round, and fasten it with the tail in the mouth, lay it on a fish-plate, cover it well with cold water, throw in some salt as soon as it boils, skim it well, and boil the fish gently from half to a whole hour according to its size. Some persons prefer the scales taken off the pike when it is prepared for this mode of dressing; and many cooks still put the fish into _boiling_ water well salted and skimmed. Serve it with plain melted butter, or anchovy sauce.

Footnote 49:

Soaking fish is always better avoided when it can be so; well washing the inside with strong vinegar would perhaps remove the objectionable flavour without it.

Moderate sized, 1/2 hour; large, 1 hour.

Obs.—We must repeat that it is impossible to give for fish which varies so much in quality as well as in size, directions for the exact time which is required to cook it; a few minutes, more or less, must often be allowed; and it should always be watched attentively, and lifted from the water as soon as it is done.

TO BAKE PIKE.

(_Common Receipt._)

Pour warm water over the outside of the fish, and wipe it very clean with a coarse cloth drawn from the head downwards, that the scales may not be disturbed; then wash it well in cold water, empty, and cleanse the inside with the greatest nicety, fill it either with the common forcemeat No. 1, or with No. 4 of Chapter VIII., sew it up, fasten the tail to the mouth, give it a slight dredging of flour, stick small bits of butter thickly over it, and bake it from half to three quarters of an hour, should it be of moderate size, and upwards of an hour, if it be large. Should there not be sufficient sauce with it in the dish, melted butter and a lemon, or anchovy sauce may be sent to table with it. When more convenient the forcemeat may be omitted, and a little fine salt and cayenne, with some bits of butter, put into the inside of the fish, which will then require rather less baking. A buttered paper should always be laid over it in the oven, should the outside appear likely to become too highly coloured or too dry before the fish is done; and it is better to wrap quite small pike in buttered paper at once before they are sent to the oven.

Moderate-sized pike, 30 to 45 minutes; large pike, 1 to 1-1/4 hour.

TO BAKE PIKE.

(_Superior Receipt._)

Scale and wash the fish, take out the gills, then open it just sufficiently to allow the inside to be emptied and _perfectly cleansed_, but not more than is necessary for that purpose. Wipe it as dry as possible in every part, then hang it for an hour or two on a hook in a cool larder, or wrap it in a soft cloth. Fill the body with the forcemeat No. 1 or 3, or with the oyster forcemeat of Chapter VIII.; sew it up very securely, curl it round, and fasten the tail into the mouth with a thin skewer, then dip it into the beaten yolks of two or more eggs, seasoned with nearly half a teaspoonful of salt and a little pepper or cayenne; cover it equally with the finest bread-crumbs,

dip it a second time into the egg and crumbs, then pour some clarified butter gently over it, through a small strainer, and send it to a well heated oven for an hour and a quarter or more, should it be _very_ large, but for less time if it be only of moderate size. As it is naturally a very dry fish, it should not be left in the oven after it is thoroughly done, but it should never be sent to table until it is so. The crumbs of bread are sometimes mixed with a sufficient quantity of minced parsley to give the surface of the fish a green hue. Send plain melted butter, and brown caper, or Dutch sauce to table with it.

TO STEW CARP.

(_A common Country Receipt._)

[Illustration:

Carp.]

Scale and clean the fish with exceeding care, lay it into a stewpan, and cover it with good cold beef or veal broth; add one small onion stuck with a few cloves, a faggot of savoury herbs, three or four slices of carrot, and a little salt, and stew the carp as gently as possible for nearly an hour. Have ready some good brown gravy, mixed with a couple of glassesful of port wine; add a squeeze of lemon-juice, dish the carp very carefully, pour the sauce over, and serve it immediately. We would recommend the Genevese Sauce, of Chapter V., as superior to any other for this dish.

This receipt is for a fish which averages from five to six pounds in weight, but the carp sometimes attains to a very large size; and sufficient time to cook it perfectly should always be allowed for it.

TO BOIL PERCH.[50]

Footnote 50:

The figure of this fish is very disproportioned in size to that of the carp and other kinds inserted here, as it is _quite small_ at its fullest growth compared with the carp, which sometimes attains to a great weight.

[Illustration:

Perch.]

First wipe or wash off the slime, then scrape off the scales, which adhere rather tenaciously to this fish; empty and clean the insides perfectly, take out the gills, cut off the fins, and lay the perch into equal parts of cold and of boiling water, salted as for mackerel: from eight to ten minutes will boil them unless they are very large. Dish them on a napkin, garnish them with curled parsley, and serve melted butter with them, or _Maître d'Hôtel Sauce Maigre_.

Very good French cooks put them at once into boiling water and keep them over a brisk fire for about fifteen minutes. They dress them also without taking off the scales or fins until they are ready to serve, when they strip the whole of the skin off carefully, and stick the red fins into the middle of the backs; the fish are then covered with the Steward's sauce, thickened with eggs.

In warm water, 8 to 10 minutes; in boiling, 12 to 15 minutes.

TO FRY PERCH OR TENCH.

Scale, and clean them perfectly; dry them well, flour and fry them in boiling lard. Serve plenty of crisped or fried parsley round them.

TO FRY EELS.

[In season all the year, but not so well-conditioned in April and May as in other months.]

First kill, then skin, empty, and wash them as clean as possible; cut them into four-inch lengths, and dry them well in a soft cloth. Season them with fine salt, and white pepper, or cayenne, flour them thickly, and fry them a fine brown in boiling lard; drain and dry them as directed for soles, and send them to table with plain melted butter or anchovy sauce. Eels are sometimes dipped into batter and then fried; or into egg and fine bread-crumbs (mixed with minced parsley or not, at pleasure), and served with plenty of crisped parsley round, and on them.

It is an improvement for these modes of dressing the fish to open them entirely; and remove the bones: the smaller parts should be thrown into the pan a minute or two later than the thicker portions of the bodies or they will not be equally done.

BOILED EELS.

(_German Receipt._)

Pare a fine lemon, and strip from it entirely the white inner rind; slice it, and remove the pips with care; put it with a blade of mace, a small half-teaspoonful of white peppercorns, nearly twice as much of salt, and a moderate-sized bunch of parsley, into three pints of cold water, bring them gently to boil, and simmer them for twenty minutes; let them become quite cold; then put in three pounds of eels skinned; and cleaned with great nicety, and cut into lengths of three or four inches; simmer them very softly from ten to fifteen minutes, lift them with a slice into a very hot dish, and serve them with a good Dutch sauce, or with parsley and butter acidulated with lemon-juice, or with chili vinegar.

For boiled eels with sage (German Receipt), _see Chapter of Foreign Cookery_.

EELS.

(_Cornish Receipt._)

Skin, empty, and wash as clean as possible, two or three fine eels, cut them into short lengths, and just cover them with cold water; add sufficient salt and cayenne to season them, and stew them very softly indeed from fifteen to twenty minutes, or longer should they require it. When they are nearly done, strew over them a teaspoonful of minced parsley, thicken the sauce with a teaspoonful of flour mixed with a slice of butter, and add a quarter of a pint or more of clotted cream. Give the whole a boil, lift the fish into a hot dish, and stir briskly the juice of half a lemon into the sauce; pour it upon the eels, and serve them immediately: Very sweet thick cream is, we think, preferable to clotted cream for this dish. The sauce should be of a good consistence, and a dessertspoonful of flour will be needed for a large dish of the stew, and from one and a half to two ounces of butter. The size of the fish must determine the precise quantity of liquid and of seasoning which they will require.

RED HERRINGS, À LA DAUPHIN.

Take off the heads, open the backs of the fish, and remove the backbones: soak the herrings, should they be very dry, for two or three hours in warm milk and water, drain and wipe them. Dissolve a slice of fresh butter, and mix it with the beaten yolks of a couple of eggs and some savoury herbs minced small: dip the fish into these, and spread them thickly with fine bread-crumbs; broil them of a light brown, over a moderate fire, and serve them on hot buttered toasts, sprinkled with a little cayenne.

RED HERRINGS, COMMON ENGLISH MODE.

This fish is rendered infinitely more delicate by pouring boiling water on it before it is dressed, and leaving it to soak for half an hour, or more, should it be highly dried. The fresh Yarmouth bloaters do not require this. Cut off the heads and tails, open the herrings at the back, and warm them through before the fire, or upon the gridiron. They may be rubbed with a bit of cold butter, and seasoned with a slight sprinkling of pepper or cayenne, when these are liked, or served quite plain.

ANCHOVIES FRIED IN BATTER.

Scrape very clean a dozen or more of fine anchovies, and soak them in plenty of spring water from two to six hours: then wipe them dry, open them, and take out the backbones, without dividing the fish. Season the insides highly with cayenne, close the anchovies, dip them into the French batter of Chapter V., or into a light English batter, and fry them a pale amber-colour: in from four to five minutes they will be quite sufficiently done.

CHAPTER III.

=Dishes of Shell-Fish=

[Illustration]

OYSTERS.

[In season from September to April.]

THE old-fashioned plan of _feeding_ oysters with a sprinkling of oatmeal or flour, in addition to the salt and water to which they were committed, has long been rejected by all genuine amateurs of these nutritious and excellent fish, who consider the plumpness which the oysters are supposed to gain from the process, but poor compensation for the flavour which they are sure to lose. To cleanse them when they first come up from the beds, and to keep them in good condition for four or five days, they only require to be covered with cold water, with five ounces of salt to the gallon dissolved in it before it is poured on them; this should be changed with regularity every twenty-four hours. By following this plan with exactness they may be kept alive from a week to ten days, but will remain in perfect condition scarcely more than half that time. Oysters should be eaten always the instant they are opened. Abroad they are served before the soup in the first course of a dinner, arranged usually in as many plates as there are guests at table. In England they are sometimes served _after_ the soup. A sense of _appropriateness_ must determine how far the variations of fashion should be followed in such matters.

Obs.—We were accustomed formerly to have the brine which was supplied to oysters intended to be kept for some days, changed twice in the twenty-four hours; but we were informed by an oyster merchant in an extensive business that once was sufficient.

TO SCALLOP OYSTERS.

Large coarse oysters should never be dressed in this way. Select small plump ones for the purpose, let them be opened carefully, give them a scald in their own liquor, wash them in it free from grit, and beard them neatly. Butter the scallop shells and shake some fine bread-crumbs over them; fill them with alternate layers of oysters, crumbs of bread, and fresh butter cut into small bits; pour in the oyster-liquor, after it has been strained, put a thick, smooth layer of bread-crumbs on the top, moisten them with clarified butter,[51] place the shells in a Dutch oven before a clear fire, and turn them often until the tops are equally and lightly browned: send them immediately to table.

Footnote 51:

Common cooks merely stick small bits of butter on them.

Some persons like a little white pepper or cayenne, and a flavouring of nutmeg added to the oysters; others prefer pounded mace. French cooks recommend with them a mixture of minced mushrooms stewed in butter till quite tender, and sweet herbs finely chopped. The fish is sometimes laid into the shells after having been bearded only.

SCALLOPED OYSTERS À LA REINE.

Plump and beard the oysters, after having rinsed them well in their own strained liquor; add to this about an equal quantity of very rich white sauce, and thicken it, if needful, with half a teaspoonful of flour, mixed with a small slice of butter, or with as much arrow-root only; put in the oysters, and keep them at the point of simmering for three or four minutes: lay them into the shells, and cover the tops thickly with crumbs fried a delicate brown and well dried; or heap over them instead, a layer of fine crumbs; pour clarified butter on them, and brown them with a salamander.

TO STEW OYSTERS.

A pint of small plump oysters will be sufficient for a quite moderate-sized dish, but twice as many will be required for a large one. Let them be very carefully opened, and not mangled in the slightest degree; wash them free from grit in their own _strained_ liquor, lay them into a very clean stewpan or well-tinned saucepan, strain the liquor a second time, pour it on them, and heat them slowly in it. When they are just beginning to simmer, lift them out with a slice or a bored wooden spoon, and take off the beards; add to the liquor a quarter of a pint of good cream, a seasoning of pounded mace, and cayenne, and a little salt, and when it boils, stir in from one to two ounces of good butter, smoothly mixed with a large teaspoonful of flour; continue to stir the sauce until these are perfectly blended with it, then put in the oysters, and let them remain by the side of the fire until they are very hot: they require so little cooking that, if kept for four or five minutes nearly simmering, they will be ready for table, and they are quickly hardened by being allowed to boil, or by too much stewing. Serve them garnished with pale fried sippets.

Small plump oysters, 1 pint: their own liquor: brought slowly to the point of simmering. Cream, 1/4 pint; seasoning of pounded mace and cayenne; salt as needed; butter, 1 to 2 oz.; flour, 1 large teaspoonful.

Obs.—A little lemon-juice should be stirred quickly into the stew just as it is taken from the fire. Another mode of preparing this dish, is to add the strained liquor of the oysters to about an equal quantity of rich _bechamel_, with a little additional thickening; then to heat them in it, after having prepared and plumped them properly. Or, the beards of the fish may be stewed for half an hour in a little pale gravy, or good broth, and this, when strained and mixed with the oyster-liquor, may be brought to the consistency of cream with the French thickening of Chapter V., or, with flour and butter, then seasoned with spice as above: the process should be quite the same in all of these receipts, though the composition of the sauce is varied. Essence of anchovies, cavice, chili vinegar, or yolks of eggs can be added to the taste.

For Curried Oysters see Chapter XVI.

OYSTER SAUSAGES.

(_A most excellent Receipt._)

Beard, rinse well in their strained liquor, and mince but not finely, three dozens and a half of plump native oysters, and mix them with ten ounces of fine bread-crumbs, and ten of beef-suet chopped extremely small; add a saltspoonful of salt, and one of pepper, or less than half the quantity of cayenne, twice as much pounded mace, and the third of a small nutmeg grated: moisten the whole with two unbeaten eggs, or with the yolks only of three, and a dessertspoonful of the whites. When these ingredients have been well worked together, and are perfectly blended, set the mixture in a cool place for two or three hours before it is used; make it into the form of small sausages or sausage cakes, flour and fry them in butter of a fine light brown; or throw them into boiling water for three minutes, drain, and let them become cold, dip them into egg and bread-crumbs, and broil them gently until they are lightly coloured. A small bit should be cooked and tasted before the whole is put aside, that the seasoning may be heightened if required. The sausages thus made are extremely good: the fingers should be well floured in making them up.

Small plump oysters, 3-1/2 dozens; bread-crumbs, 10 oz.; beef suet, 10 oz.; seasoning of salt, cayenne, pounded mace, and nutmeg; unbeaten eggs 2, or yolks of 3.

TO BOIL LOBSTERS.

[In full season from April to October: may be had all the year.]

Choose them by the directions given at the commencement of this chapter, and throw them into plenty of _fast-boiling_ salt and water, that life may be destroyed in an instant.

To 1 gallon of water, 5 ounces salt: moderate sized lobster, 15 to 20 minutes; large lobster, 30 to 40 minutes; _very_ large, 1 hour or more.

COLD DRESSED LOBSTER AND CRAB.

[Illustration:

Dressed Lobster.]

Before a lobster is sent to table take off the large claws, hold each of them firmly with the edge upwards, and with a quick light blow from a cutlet bat or ought else convenient for the purpose, crack the shell without disfiguring the fish. Split the tail open with a very sharp knife and dish the lobster in the manner shown in the engraving, either with, or without a napkin under it. When the soft part of the body is required to mix with the dressing, take it out before it is served, and add it to the _remoulade_, or other sauce with which it is to be mingled. The shrimp _chatney_ of Chapter VI. is a wholesome accompaniment to this fish; which we must remark here should be sparingly eaten, or altogether avoided, by persons in delicate health, and especially at night. It is too much the fashion to serve it as a supper dish at parties; and it sometimes produces dangerous attacks of indigestion and other illness. The flesh of the crab is much lighter. This is served in the shell, which should be entirely emptied and nicely cleaned out; the sides filled with the white flesh divided into small flakes, and the centre with the soft part or _cream_ as it is called.

[Illustration:

Dressed Crab.]

The flesh of two crabs can be served in one shell when a dish of handsome appearance is required, and the sauce can be mixed with it the instant before it is sent to table, though it will be whiter, and of better appearance without it. The centre may be filled with a red Imperial _Mayonnaise_, when a good effect is wanted. For other appropriate sauces see Chapter VI.

LOBSTERS, FRICASSEED, OR AU BÉCHAMEL. (ENTRÉE.)

Take the flesh from the claws and tails of two moderate-sized lobsters; cut it into small scallops or dice; heat it slowly quite through in about three quarters of a pint of good white sauce or _béchamel_; and serve it when it is at the point of boiling, after having stirred briskly to it a little lemon-juice just as it is taken from the fire. The coral, pounded and mixed gradually with a few spoonsful of the sauce, should be added previously. Good shin of beef stock made without vegetables (see page 97), and somewhat reduced by quick boiling, if mixed with an equal proportion of cream, and thickened with arrow-root, will answer extremely well in a general way for this dish, which is most excellent if well made. The sauce should never be thin; nor more than sufficient in quantity to just cover the fish. For a second course dish, only as much must be used as will adhere to the fish, which after being heated should be laid evenly into the shells, which ought to be split quite through the centre of the backs in their entire length, without being broken or divided at the joint, and nicely cleaned. When thus arranged, the lobster may be thickly covered with well dried, fine, pale fried crumbs of bread, or with unfried ones, which must then be equally moistened with clarified butter, and browned with a salamander. A small quantity of salt, mace, and cayenne, may be required to finish the flavouring of either of these preparations.

HOT CRAB, OR LOBSTER.

(_In season during the same time as Lobsters._)

Slice quite small, or pull into light flakes with a couple of forks, the flesh of either fish; put it into a saucepan with a few bits of good butter lightly rolled in flour, and heat it slowly over a gentle fire; then pour over and thoroughly mix with it, from one to two teaspoonsful or more of common or of chili vinegar; if with the former, add to it a tolerable seasoning of cayenne. Grate in a little nutmeg, and when the whole is well heated serve it immediately, either in the shell of the crab or lobster, or in scallop-shells, and serve it plain, or with bread-crumbs over, as in the preceding receipt. A spoonful or so of good meat jelly is, we think, a great improvement to this dish, for which an ounce and a half of butter will be quite sufficient.

This is sometimes called _Buttered Crab_.

POTTED LOBSTERS.

Separate carefully the flesh of freshly-boiled lobsters from the shells, and from the tough red skin of the tails, mince the fish up quickly with a very sharp knife, turn it immediately into a large mortar, and strew over it a mixed seasoning of fine cayenne, pounded mace, lightly grated nutmeg, and salt: this last should be sparingly used in the first instance, and it should be reduced to powder before it is added. Pound the lobsters to a perfect paste with from two to three ounces of firm new butter to each fish if of large size, but with less should it be small; and the lobster-coral previously rubbed through a sieve, or with a portion of it only, should any part of it be required for other purposes. When there is no coral, a fine colour may be given to the mixture by stewing the red skin of the tails very softly for ten or twelve minutes in part of the butter which is used for it, but which must be strained and left to become perfectly cold before it is mingled with the fish. The degree of seasoning given to the mixture can be regulated by the taste; but no flavour should predominate over that of the lobster itself; and for all delicate preparations, over-spicing should be particularly avoided. A quart or more of fine brown shrimps, if very fresh and quickly shelled at the instant of using, may be chopped up and pounded with the lobsters with excellent effect. Before the mixture is taken from the mortar it should be placed in a cool larder, or set over ice for a short time, to render it firm before it is pressed into the potting-pans or moulds. In putting it into these, be careful to press it into a compact, even mass; smooth the surface, run a little clarified butter over, when it is only _just liquid_, for if hot it would prevent the fish from keeping—and send the lobster to table, neatly garnished with light green foliage; or with ornamentally-cut paper fastened round the mould; or with a small damask napkin tastefully arranged about it.

Obs.—By pounding separately part of the white flesh of the fish, freed from every particle of the skin, and by colouring the remainder highly with the coral of the lobster, and then pressing the two in alternate and regular layers into a mould, a dish of pretty appearance is produced, which should be turned out of the mould for table. Ham and turkey (or any other white meat) are often potted in this way.

LOBSTER CUTLETS.

(_A Superior Entrée._)

Prepare and pound with exceeding nicety, by the preceding receipt for Potted Lobsters, about three quarters of a pound of the flesh of a couple of fine fresh lobsters, of which one must be a hen lobster; add to it, when it is partially beaten, an ounce and a half of sweet new butter, a saltspoonful of salt, and about two-thirds as much of mixed mace and cayenne, with a dessertspoonful of the inside coral, the whole of which should be rubbed with a wooden spoon through a hair sieve, to be in readiness for use. When all these ingredients are well blended, and beaten to the finest and smoothest paste, the mixture should be tested by the taste, and the seasoning heightened if needful; but, as the preparation is very delicate, it should not be over-spiced. Mould it into the form of small cutlets about the third of an inch thick, stick into each a short bit of the smallest claws, strew the coral lightly over them so as to give them the appearance of being crumbed with it, arrange them round the dish in which they are to be sent to table, place them in a very gentle oven for eight or ten minutes only to heat them through, or warm them in a Dutch or American oven, placed at some distance from the fire, that the brilliant colour of the coral may not be destroyed; and pour into the centre some good _béchamel_ (see page 108), or the Lady's Sauce, or the Cream Sauce of Chapter IV. A very white sauce best contrasts with the colour of the cutlets. This is an excellent and elegant dish, of which an admirable variety is made by the addition of three or four ounces of the freshest shrimps, quickly shelled, and chopped before they are thrown into the mortar, with half an ounce of butter and a little spice. All the coral can be added to the cutlets at pleasure; but it is generally in request for many purposes, and is required for this one only in part.

Obs.—As lobsters are well known to be the most indigestible of shell fish, and as they sometimes prove dangerously so to persons out of health, these pounded preparations are the best and safest forms in which they can be served: they should at all times be beaten to a smooth, _fibreless_ paste, before they are taken from the mortar; and no fish that is not entirely _fresh_ should ever be used for them. Prawns may be advantageously served in the same manner.

For Indian Lobster Cutlets, see Chapter of Foreign Cookery.

LOBSTER SAUSAGES.

Let the fish be pounded as for the cutlets above or for _boudinettes_, but mix half or more of the coral with the flesh of the lobsters; shape it like small sausages, sprinkle them with the powdered coral, and heat them through in a Dutch or American oven. They may be brushed with clarified butter before the coral is strewed over them, but they scarcely need it. A fierce degree of heat will destroy the excellence of _all_ these preparations.

BOUDINETTES OF LOBSTERS, PRAWNS, OR SHRIMPS. (ENTRÉE).

(_Author's Receipt._)

When the fish has been prepared as above, mould it in as many _very small_ round cups as will suffice for a dish; heat them gently through at the mouth of the oven or before the fire, and serve them dry, or with a little rich white sauce, coloured with lobster-coral poured round, but not upon them. These _boudinettes_ are delicious, made entirely of shrimps or prawns, which it is an advantage to have prepared as follows, either for this purpose or for potting simply, as they will then be firmer, and will also remain good much longer:—Shell them quickly, and touch them as little as possible in the process; put them into an enamelled saucepan with about three ounces of butter to the quart, and strew the spice upon them; place them by the side of a gentle fire that they may heat through very gradually, and shake the saucepan round occasionally to mingle the seasoning equally with them. Do not allow them to boil, as that would render them tough, but when they are heated quite through and the butter approaches the point of simmering, draw them from the fire; let them remain for a few minutes in the saucepan, then lay them very evenly and closely into the pans and pour the butter on them; but let it be clear from sediment, or from any liquid which may be perceptible at the bottom of the saucepan. When merely required for _boudinettes_, the fish may be turned into a large pan or basin and left until thoroughly cold, then chopped small upon a dish with the butter in which they are imbedded, and pounded as usual; no additional butter will be required for them, and part of that in which they have been heated may be set aside for fish-sauce when the proportion of it directed here is considered too large. As it should cover the shrimps entirely when they are potted whole, sufficient to do so should be melted with them. It is an excellent plan to dissolve it in a separate saucepan, to skim it well, and after it has stood to become clear, to pour it gently over the shrimps, leaving all the buttermilk behind. They should not be placed immediately by the fire, or they will

heat too quickly: they should be set away from it until the butter has cooled upon them. If carefully prepared, and agreeably seasoned, they will be excellent, and can be sent to a great distance without detriment if packed so as to be kept cool. The red shrimps may be substituted for the brown, when they can be more easily procured.

Obs.—Lobsters and shrimps, or prawns, in equal proportions, answer _extremely_ well for _boudinettes_ as for potting.

TO BOIL SHRIMPS OR PRAWNS.

Throw them into plenty of fast boiling water, to which salt has been added in the proportion of from five to six ounces to the gallon; take off all the scum, boil the shrimps for five or six minutes, or rather less should they be very small, and the prawns for about two minutes longer. The shrimpers[52] of the coast frequently cook them in sea-water, but the flavour is not then so agreeable as when fresh brine is used for them. They are always unwholesome when not sufficiently boiled; and even more so when they are stale. As soon as they are tender, drain them well in a cullender, and spread them out on a soft cloth to cool; or dish them on a napkin, and send them hot to table when they are liked so. The large brown shrimps are considered the best, and they are more easily shelled than the red ones: these last, however, are sometimes preferred to them. Prawns, though superior to shrimps only in _size_, are always much higher in price.

Footnote 52:

Or _pandlers_, as they are often called.

Shrimps, 5 to 6 minutes if large. Prawns, 6 to 8 minutes.

Obs.—Ready-dressed shrimps or prawns may be preserved fit for eating at least twelve hours longer than they would otherwise keep, by throwing them for an instant into boiling salt and water, when they first begin to lose their freshness, and then draining them as above.

TO DISH COLD PRAWNS.

When they are quite cold, dish them singly upon a very white napkin neatly arranged over a saucer or small basin reversed in a dish, and garnish the base with a wreath of curled parsley, or with small leaves of the purple endive.

TO SHELL SHRIMPS AND PRAWNS QUICKLY AND EASILY.

This, though a most simple process, would appear, from the manner in which it is performed by many people, to be a very difficult one; indeed it is not unusual for persons of the lower classes, who, from lack of a little skill, find it slow and irksome, to have resource to the dangerous plan of eating the fish entire. It need scarcely be remarked that very serious consequences may accrue from the shells being swallowed with them, particularly when they are taken in large quantities. Unless the fish be stale, when they are apt to break, they will quit the shells easily if the head be held firmly in the right hand and the tail in the other, and the fish be straightened entirely, then the two hands pressed quickly towards each other, and the shell of the tail broken by a slight vibratory motion of the right hand, when it will be drawn of with the head adhering to it: a small portion, only will then remain on at the other end, which can be removed in an instant.

CHAPTER IV.

=Gravies.=

INTRODUCTORY REMARKS.

[Illustration:

Gravy Kettle.]

GRAVIES are not often required either in great variety, or in abundant quantities, when only a moderate table is kept, and a clever cook will manage to supply, at a trifling cost, all that is generally needed for plain family dinners; while an unskilful or extravagant one will render them sources of unbounded expense.[53] But however small the proportions in which they are made, their _quality_

should be particularly attended to, and they should be well adapted in flavour to the dishes they are to accompany. For some, a high degree of savour is desirable, but for fricassees, and other preparations of delicate white meats, this should be avoided, and a soft, smooth sauce of refined flavour should be used in preference to any of more piquant relish.

Footnote 53:

We know of an instance of a cook who stewed down two or three pounds of beef to make gravy for a single brace of partridges; and who complained of the meanness of her employers (who were by no means affluent) because this was objected to.

Instead of frying the ingredients for brown gravies, which is usually done in common English kitchens, French cooks pour to them at first a small quantity of liquid, which is reduced by rapid boiling to what is technically called _glaze_; particular directions for which will be found in the next receipt to this, and also at pages 10 and 104. When the glaze has acquired the proper colour, boiling broth should be added in small portions, and well shaken round the stewpan to detach it entirely; the meat may then be stewed gently for three or four hours with a few mushrooms, should they be at hand, a bunch of parsley, and some green onions, or with a Portugal onion instead.

A thick slice or two of an unboiled ham, is an almost indispensable addition to rich soup or gravy, and to supply it in the most economical manner, a large, highly cured one, or more, not over fatted, should be kept for the purpose, and cut as required. The bones of undressed meat will supply almost, or quite as good gravy-stock as the meat itself, if well boiled down, particularly those of the loin, or neck of veal; and as the flesh of these may be dressed in many ways advantageously without them, the whole joint may be turned to excellent account by so dividing it.

The necks of poultry, with the feet properly skinned, a few herbs, a morsel or two of ham or of lean bacon, and such slight flavourings beside as the spice-box can supply, with a few drops of good mushroom catsup, will of themselves, if well managed, produce sufficient gravy to serve with the birds from which they are taken; and if not wanted for the purpose, they should always be stewed down, or thrown into the stock pot, for which the shank bones of legs of mutton, and all trimmings of meats should likewise be reserved. Excellent broth for the sick or for the needy, may also be made of them at little cost, when they are not required for other uses.

To deepen the colour of gravies, the thick mushroom _pressings_ of Chapter VII., or a little soy (when its flavour is admissible), or cavice [TN: illegible], or Harvey's sauce, may be added to it; and for some dishes, a glass of claret, or of port wine.

Vermicelli, or rasped cocoa-nut, lightly, and _very_ gently browned in a small quantity of butter, will both thicken and enrich them, if about an ounce of either to the pint of gravy be stewed gently in it, from half an hour to an hour, and then strained out.

All the ingredients indicated at page 4, for giving consistency to soups, will answer equally for gravies, which should not, however, be too much thickened, particularly with the unwholesome mixture of flour and butter, so commonly used for the purpose. Arrow-root or rice-flour, or common flour gradually browned in a slow oven, are much better suited to a delicate stomach. No particle of fat should ever be perceptible upon them when they are sent to table; and when it cannot be removed by skimming, they should be allowed to become sufficiently cold for it to congeal, and be taken off at once without trouble. It may be cleared from such as have not been thickened by passing them through a closely woven cloth, which has previously been laid into, and well wrung from, some cold water.

JEWISH SMOKED BEEF.

(_Extremely useful for giving flavour to soup and gravy._)

This beef, of which we have more fully spoken in Chapter XXXIV.[TN: chapter missing], imparts a remarkably fine flavour to soup or gravy; but great care must be taken in using it to cut _quite away_ all the external parts which have been discoloured in the drying: the whole of the surface, indeed, should be rather thickly pared off, or it will give a _smoky_ taste to the gravy. An ounce or two of the lean thus cleared from the outsides and from all skin and fat, and divided first into thick slices, and then into small squares, will flavour a pint or more of stock of any kind: it may be added to the meat in making Liebeg gravy when it is first put into the stewpan.

TO HEIGHTEN THE COLOUR AND THE FLAVOUR OF GRAVIES.

This is best done by the directions given for making _Espagnole_. An ounce or two of the lean of unboiled ham, cut into dice and coloured slowly in a small stewpan, or smoothly-tinned iron saucepan, with less than an ounce of butter, a blade of mace, two or

three cloves, a bay-leaf, a few small sprigs of savoury herbs, and an eschalot or two, or about a teaspoonful of minced onion, and a little young parsley root, when it can be had, will convert common shin of beef stock, or even strong broth, into an excellent gravy, if it be gradually added to them after they have stewed slowly for quite half an hour, and then boiled with them for twenty minutes or more. The liquid should not be mixed with the other ingredients until the side of the stewpan is coloured of a reddish brown; and should any thickening be required, a teaspoonful of flour should be stirred in well, and simmered for three or four minutes before the stock is added; the pan should be strongly shaken round afterwards, to detach the browning from it, and this must be done often while the ham is stewing.

Obs.—The cook who is not acquainted with this mode of preparing or enriching gravies, will do well to make herself acquainted with it; as it presents no difficulties, and is exceedingly convenient and advantageous when they are wanted in small quantities, very highly flavoured and well coloured. An unboiled ham, kept in cut, will be found, as we have already said, a great economy for this, and other purposes, saving much of the expense commonly incurred for gravy-meats. As eschalots, when sparingly used, impart a much finer savour than onions, though they are not commonly so much used in England, we would recommend that a small store of them should always be kept.

BARON LIEBEG's BEEF GRAVY.

(_Most excellent for hashes, minces, and other dishes made of cold meat._)

For particulars of this most useful receipt, for extracting all its juices from fresh meat of every kind in the best manner, the cook is referred to the first part of the chapter on soups. The preparation, for which minute directions are given there, if poured on a few bits of lean ham lightly browned, with the other ingredients indicated above, will be converted into gravy of fine flavour and superior quality.

With no addition, beyond that of a little thickening and spice, it will serve admirably for dressing cold meat, in all the usual forms of hashes, minces, _blanquettes_, &c., &c., and convert it into dishes as nourishing as those of meat freshly cooked, and it may be economically made in small quantities with any trimmings of _undressed_ beef, mutton, or veal, mixed together, which are free from fat, and not sinewy: flavour may be given to it at once by chopping up with them the lean part only of a slice or two of ham, or of highly-cured beef.

SHIN OF BEEF STOCK FOR GRAVIES.

There is no better foundation for strong gravies than shin of beef stewed down to a jelly (which it easily becomes), with the addition only of some spice, a bunch of savoury herbs, and a moderate proportion of salt; this, if kept in a cool larder, boiled softly for two or three minutes every second or third day, and each time put into a clean, well-scalded pan, will remain good for many days, and may easily be converted into excellent soup or gravy. Let the bone be broken in one or two places, take out the marrow, which, if not wanted for immediate use, should be clarified, and stored for future occasions; put a pint and a half of cold water to the pound of beef, and stew it very gently indeed for six or seven hours, or even longer should the meat not then be quite in fragments. The bones of calf's feet which have been boiled down for jelly, the liquor in which the head has been cooked, and any remains of ham quite freed from the smoky parts, from rust, and fat, will be serviceable additions to this stock. A couple of pounds of the neck of beef may be added to six of the shin with very good effect; but for white soup or sauces this is better avoided.

Shin of beef, 6 lbs.; water, 9 pints; salt, 1 oz.; large bunch of savoury herbs; peppercorns, 1 teaspoonful; mace, 2 blades.

RICH PALE VEAL GRAVY, OR CONSOMMÉ.

The French, who have always at hand their stock-pot of good _bouillon_ (beef soup or broth), make great use of it in preparing their gravies. It is added instead of water to the fresh meat, and when this, in somewhat larger proportions, is boiled down in it, with the addition only of a bunch of parsley, a few green onions, and a moderate seasoning of salt, a strong and very pure-flavoured pale gravy is produced. When the best joints of fowls, or of partridges have been taken for fricassees or cutlets, the remainder may be stewed with a pound or two of veal into a _consommé_, which then takes the name of chicken or of game gravy. For a large dinner it is always desirable to have in readiness such stock as can easily and quickly be converted into white and other sauces. To make this, arrange a slice or two of lean ham in a stewpan or saucepan with three pounds of the neck of veal once or twice divided (unless the thick fleshy part of the knuckle can be had), and pour to them three full pints of strong beef or veal broth; or, if this cannot conveniently be done, increase the proportion of meat or diminish that of the liquid, substituting water for the broth; throw in

some salt after the boiling has commenced, and the gravy has been well skimmed, with one mild onion, a bunch of savoury herbs, a little celery, a carrot, a blade of mace, and a half-saltspoonful of peppercorns; stew those very gently for four hours; then, should the meat be quite in fragments, strain off the gravy, and let it become sufficiently cold to allow the fat to be entirely cleared from it. A handful of nicely prepared mushroom-buttons will much improve its flavour; and the bones of boiled calf's feet, or the fresh ones of fowls, will be found excellent additions to it. A better method of making it, when time and trouble are not regarded, is to heat the meat, which ought to be free of bones, quite through, with from a quarter to half a pint of broth only, and when on probing it with the point of a knife no blood issues from it, and it has been turned and equally done, to moisten it with the remainder of the broth, which should be boiling.

Lean of ham, 6 to 8 oz.; neck or knuckle of veal, 3 lbs.; strong broth, 3 pints (or veal, 4 lbs., and water, 3 pints); salt; bunch of savoury herbs; mild onion, 1; carrot, 1 large or 2 small; celery 1/2 small head; mace, 1 large blade; peppercorns, 1/2 saltspoonful; 4 hours or more. Or: ham, 1/2 lb.; veal, 4 lbs.; broth, third of a pint; nearly 1 hour. Additional broth, 3 pints: 3-1/2 to 4-1/2 hours.

RICH DEEP-COLOURED VEAL GRAVY.

Lay into a large thick stewpan or saucepan, from half to three quarters of a pound of undressed ham, freed entirely from fat, and from the smoked edges, and sliced half an inch thick; on this place about four pounds of lean veal, cut from the best part of the knuckle or from the neck (part of the fillet, which in France is often used for it instead, not being generally purchasable here, the butchers seldom dividing the joint); pour to them about half a pint of good broth,[54] and place the pan over a brisk fire until it is well reduced; then thrust a knife into the meat, and continue the stewing more gently until a glaze is formed as we have described at page 10. The latter part of the process must be _very slow_; the stewpan must be frequently shaken, and the gravy closely watched that it may not burn: when it is of a fine _deep_ amber colour, pour in sufficient boiling broth to cover the meat, add a bunch of parsley, and a few mushrooms and green onions. A blade or two of mace, a few white peppercorns, and a head of celery, would, we think, be very admissible additions to this gravy, but it is extremely good without. Half the quantity can be made, but it will then be rather more troublesome to manage.

Footnote 54:

When there is no provision of this in the house, the quantity may be made with a small proportion of beef, and the trimmings of the veal, by the directions for _Bouillon_, Chapter I.

Undressed ham, 8 to 12 oz.; lean veal, 4 lbs.; broth, 1/2 pint; 1 to 2 hours. Broth, 3 to 4 pints: bunch of parsley and green onions, or 1 Portugal onion; mushrooms, 1/4 to 1/2 pint: 1-1/2 to 2 hours.

GOOD BEEF OR VEAL GRAVY. (ENGLISH RECEIPT.)

Flour and fry lightly in a bit of good butter a couple of pounds of either beef or veal; drain the meat well from the fat, and lay it into a small thick stewpan or iron saucepan; pour to it a quart of boiling water; add, after it has been well skimmed and salted, a large mild onion sliced, very delicately fried, and laid on a sieve to drain, a carrot also sliced, a small bunch of thyme and parsley, a blade of mace, and a few peppercorns; stew these gently for three hours or more, pass the gravy through a sieve into a clean pan, and when it is quite cold clear it entirely from fat, heat as much as is wanted for table, and if not sufficiently thick stir into it from half to a whole teaspoonful of arrow-root mixed with a little mushroom catsup. Beef or veal, 2 lbs.; water, 2 pints; fried onion, 1 large; carrot, 1; small bunch of herbs; salt, 1 small teaspoonful or more; mace, 1 blade; peppercorns, 20: 3 to 3-1/2 hours.

A RICH ENGLISH BROWN GRAVY.

Brown lightly and carefully from four to six ounces of lean ham, thickly sliced and cut into large dice; lift these out, and put them into the pan in which the gravy is to be made; next, fry lightly also, a couple of pounds of neck of beef dredged moderately with flour, and slightly with pepper; put this, when it is done, over the ham; and then brown gently and add to them two or three eschalots, or a Portugal onion; should neither of these be at hand, one _not_ large common onion must be used instead. Pour over these ingredients a quart of boiling water, or of weak but well-flavoured broth; bring the whole slowly to a boil, clear off the scum with great care, throw in a saltspoonful of salt, four cloves, a blade of mace, twenty corns of pepper, a bunch of savoury herbs, a carrot, and a few slices of celery: these last two may be fried or not as is most convenient. Boil the gravy very softly until it is reduced to little more than a pint; strain, and set it by until the fat can be taken from it. Heat it anew, add more salt if needed and a little mushroom catsup, cayenne-vinegar, or whatever flavouring it may require for the dish with which it is to be served; it will seldom

require any thickening. A dozen small mushrooms prepared as for pickling, or two or three morels, previously well washed and soaked, may be added to it at first with advantage. Half this quantity of gravy will be sufficient for a single tureen, and the economist can diminish a little the proportion of meat when it is thought too much.

PLAIN GRAVY FOR VENISON.

Trim away the fat from some cutlets, and lay them into a stewpan; set them over a clear fire, and let them brown a little in their own gravy; then add a pint of boiling water to each pound of meat. Take off the scum, throw in a little salt, and boil the gravy until reduced one half. Some cooks broil the cutlets lightly, boil the gravy one hour, and reduce it after it is strained. For appropriate gravy to serve with venison, see “Haunch of Venison,” Chapter XV.

A RICH GRAVY FOR VENISON.

There are few eaters to whom this would be acceptable, the generality of them preferring infinitely the flavour of the venison itself to any which the richest gravy made of other meats can afford; but when the flavour of a well-made _Espagnole_ is likely to be relished, prepare it by the receipt of the following page, substituting plain _strong_ mutton stock for the veal gravy.

SWEET SAUCE, OR GRAVY FOR VENISON.

Add to a quarter-pint of common venison gravy a couple of glasses of port wine or claret, and half an ounce of sugar in lumps. Christopher North’s sauce, mixed with three times its measure of gravy, would be an excellent substitute for this.

ESPAGNOLE (SPANISH SAUCE).

A highly-flavoured Gravy.

Dissolve a couple of ounces of good butter in a thick stewpan or saucepan, throw in from four to six sliced eschalots, four ounces of the lean of an undressed ham, three ounces of carrot, cut in small dice, one bay leaf, two or three branches of parsley, and one or two of thyme, but these last must be small; three cloves, a blade of mace, and a dozen corns of pepper; add part of a root of parsley, if it be at hand, and keep the whole stirred or shaken over a moderate fire for twenty minutes, then add by degrees one pint of very strong veal stock or gravy, and stew the whole gently from thirty to forty minutes; strain it, skim off the fat, and it will be ready to serve.

Butter, 2 oz.; eschalots, 4 to 6; lean of undressed ham, 4 oz.; carrots, 3 oz.; bay leaf, 1; little thyme and parsley, in branches; cloves, 3; mace, 1 blade; peppercorns, 12; little parsley root: fried gently, 20 minutes. Strong veal stock, or gravy, 1 pint: stewed very softly, 30 to 40 minutes.

ESPAGNOLE, WITH WINE.

Take the same proportions of ingredients as for the preceding _Espagnole_, with the addition, if they should be at hand, of a dozen small mushrooms prepared as for stewing; when these have fried gently in the stewpan until it appears of a reddish colour all round, stir in a tablespoonful of flour, and when it is lightly browned, add in small portions, letting each one boil up before the next is poured in, and shaking the pan well round, three quarters of a pint of hot and _good_ veal gravy, and nearly half a pint of Madeira or sherry. When the sauce has boiled gently for half an hour, add to it a small quantity of cayenne and some salt, if this last be needed; then strain it, skim off the fat entirely should any appear upon the surface, and serve it very hot. A smaller proportion of wine added a few minutes before the sauce is ready for table, would perhaps better suit with English taste, as with longer boiling its flavour passes off almost entirely. Either of these _Espagnoles_, poured over the well bruised remains of pheasants, partridges, or moor fowl, and boiled with them for an hour, will become most admirable game gravy, and would generally be considered a superlative addition to other roast birds of their kind, as well as to the hash or salmi, for which see Chapter XV.

Ingredients as in preceding receipt, with mushrooms 12 to 18; Madeira, or good sherry, 1/4 to 1/2 pint.

JUS DES ROGNONS, OR, KIDNEY GRAVY.

Strip the skin and take the fat from three fresh mutton kidneys, slice and flour them; melt two ounces of butter in a deep saucepan, and put in the kidneys, with an onion cut small, and a teaspoonful of fine herbs stripped from the stalks. Keep these well shaken over a clear fire until nearly all the moisture is dried up; then pour in a pint of boiling water, add half a teaspoonful of salt, and a little

cayenne or common pepper, and let the gravy boil gently for an hour and a half, or longer, if it be not thick and rich. Strain it through a fine sieve, and take off the fat. Spice or catsup may be added at pleasure.

Mutton kidneys, 3; butter, 2 oz.; onion, 1; fine herbs, 1 teaspoonful: 1/2 hour. Water, 1 pint; salt, 1/2 teaspoonful; little cayenne, or black pepper: 1-1/2 hour.

Obs.—This is an excellent cheap gravy for haricots, curries, or hashes of mutton; it may be much improved by the addition of two or three eschalots, and a small bit or two of lean meat.

GRAVY IN HASTE.

Chop fine a few bits of lean meat, a small onion, a few slices of carrot and turnip, and a little thyme and parsley; put these with half an ounce of butter into a thick saucepan, and keep them stirred until they are slightly browned; add a little spice, and water in the proportion of a pint to a pound of meat; clear the gravy from scum, let it boil half an hour, then strain it for use.

Meat, 1 lb.; 1 small onion; little carrot, turnip, thyme, and parsley; butter, 1/2 oz.; cloves, 6; corns of pepper, 12; water, 1 pint: 1/2 hour.

CHEAP GRAVY FOR A ROAST FOWL.

When there is neither broth nor gravy to be had, nor meat of which either can be made, boil the neck of the fowl after having cut it small, in half a pint of water, with any slight seasonings of spice or herbs, or with a little salt and pepper only; it should stew very softly for an hour or more, or the quantity will be too much reduced. When the bird is just ready for table, take the gravy from the dripping-pan, and drain off the fat from it as closely as possible; strain the liquor from the neck to it, mixing them smoothly, pass the gravy again through the strainer, heat it, add salt and pepper or cayenne, if needed, and serve it extremely hot. When this is done, the fowl should be basted with good butter only, and well floured when it is first laid to the fire. Many cooks always mix the gravy from the pan when game is roasted, with that which they send to table with it, as they think that it enriches the flavour; but to many persons it is peculiarly distasteful.

Neck of fowl; water, 1/2 pint; pepper, salt (little vegetable and spice at choice): stewed gently, 1 hour; strained, stirred to the gravy of the roast, well cleared from fat.

ANOTHER CHEAP GRAVY FOR A FOWL.

A little good broth added to half a dozen dice of lean ham, lightly browned in a morsel of butter, with half a dozen corns of pepper and a small branch or two of parsley, and stewed for half an hour, will make excellent gravy of a common kind. When there is no broth, the neck of the chicken must be stewed down to supply its place.

GRAVY OR SAUCE FOR A GOOSE.

Mince, and brown in a small saucepan, with a slice of butter, two ounces of mild onion,. When it begins to brown, stir to it a teaspoonful of flour, and in five or six minutes afterwards, pour in by degrees the third of a pint of good brown gravy; let this simmer fifteen minutes; strain it, bring it again to the point of boiling, and add to it a teaspoonful of made mustard mixed well with a glass of port wine. Season it with cayenne and pepper and _salt_, if this last be needed. Do not let the sauce _boil_ after the wine is added, but serve it _very_ hot.

Onions, 2 oz.; butter, 1-1/2 oz.: 10 to 15 minutes. Flour, 1 teaspoonful: 5 to 6 minutes. Gravy, 1/3 pint: 15 minutes. Mustard, 1 teaspoonful; port wine, 1 glassful; cayenne pepper; salt. See also Christopher North’s own sauce, page 119.

ORANGE GRAVY FOR WILD FOWL.

Boil for about ten minutes, in half a pint of rich and highly-flavoured brown gravy, or _Espagnole_, half the rind of a Seville orange, pared as thin as possible, and a small strip of lemon-rind, with a bit of sugar the size of a hazel-nut. Strain it off, add to it a quarter pint of port or claret, the juice of half a lemon, and a tablespoonful of Seville orange-juice: season it with cayenne, and serve it as hot as possible.

Gravy, 1/2 pint; 1/2 the rind of a Seville orange; lemon-peel, 1 small strip; sugar, size of hazel-nut: 10 minutes. Juice of 1/2 a lemon; Seville orange-juice, 1 tablespoonful; cayenne. See also Christopher North's own sauce, page 119.

MEAT JELLIES FOR PIES AND SAUCES.

A very firm meat jelly is easily made by stewing slowly down equal parts of shin of beef, and knuckle or neck of veal, with a pint of cold water to each pound of meat; but to give it flavour, some thick slices of lean unboiled ham should be added to it, two or three carrots, some spice, a bunch of parsley, one mild onion, or more, and a moderate quantity of salt; or part of the meat may be omitted, and a calf's head, or the scalp of one, very advantageously substituted for it, though the flavouring must then be heightened, because, though very gelatinous, these are in themselves exceedingly insipid to the taste. If rapidly boiled, the jelly will not be clear, and it will be difficult to render it so without clarifying it with the whites of eggs, which it ought never to require; if very gently stewed, on the contrary, it will only need to be passed through a fine sieve, or cloth. The fat must be carefully removed, after it is quite cold. The shin of beef recommended for this and other receipts, should be from the middle of the leg of young heifer beef, not of that which is large and coarse.

Middle of small shin of beef, 3 lbs.; knuckle or neck of veal, 3 lbs.; lean of ham, 1/2 lb.; water, 3 quarts; carrots, 2 large, or 3 small; bunch of parsley; 1 mild onion, stuck with 8 cloves; 2 small bay-leaves; 1 large blade of mace; small saltspoonful of peppercorns; salt, 3/4 oz. (more if needed): 5 to 6 hours' very gentle stewing.

Obs.—A finer jelly may be made by using a larger proportion of veal than of beef, and by adding clear beef or veal broth to it instead of water, in a small proportion at first, as directed in the receipt for _consommé_, see page 98, and by pouring in the remainder when the meat is heated through. The necks of poultry, any inferior joints of them omitted from a fricassee or other dish, or an old fowl, will further improve it much; an eschalot or two may at choice be boiled down in it, instead of the onion, but the flavour should be scarcely perceptible.

A CHEAPER MEAT JELLY.

One calf's foot, a pound and a half or two pounds of neck of veal or beef, a small onion, a carrot, a bunch of parsley, a little spice, a bit or two of quite lean ham, dressed or undressed, and five half pints of water, boiled _very_ slowly for five or six hours will give a strong, though not a highly-flavoured jelly. More ham, any bones of unboiled meat, poultry, or game will, in this respect, improve it; and the liquor in which fowls or veal have been boiled for table should, when at hand, be used for it instead of water. These jellies keep much better and longer when no vegetables are stewed down in them.

GLAZE.

This is merely _strong_, clear gravy or jelly boiled quickly down to the consistence of thin cream; but this reduction must be carefully managed that the glaze may be brought to the proper point without being burned; it must be attentively watched, and stirred without being quitted for a moment from the time of its beginning to thicken; when it has reached the proper degree of boiling, it will jelly in dropping from the spoon, like preserve, and should then be poured out immediately, or it will burn. When wanted for use, melt it gently by placing the vessel which contains it (see article _Glazing_, Chapter IX.) in a pan of boiling water, and with a paste-brush lay it on to the meat, upon which it will form a sort of clear varnish. In consequence of the very great reduction which it undergoes, salt should be added to it sparingly when it is made. Any kind of stock may be boiled down to glaze; but unless it be strong, a pint will afford but a spoonful or two: a small quantity of it, however, is generally sufficient, unless a large repast is to be served. Two or three layers must be given to each joint. The jellies which precede this will answer for it extremely well; and it may be made also with shin of beef stock, for common occasions, when no other is at hand.

ASPIC, OR CLEAR SAVOURY-JELLY.

Boil a couple of calf's feet, with three or four pounds of knuckle of veal, three quarters of a pound of lean ham, two large onions, three whole carrots, and a large bunch of herbs, in a gallon of water, till it is reduced more than half. Strain it off; when perfectly cold, remove every particle of fat and sediment, and put the jelly into a very clean stewpan, with four whites of eggs well beaten; keep it stirred until it is nearly boiling; then place it by the side of the fire to simmer for a quarter of an hour. Let it settle, and pour it through a jelly-bag until it is quite clear. Add, when it first begins to boil, three blades of mace, a teaspoonful of white peppercorns, and sufficient salt to flavour it properly, allowing for the ham, and the reduction. French cooks flavour this jelly with tarragon vinegar when it is clarified; cold poultry, game, fish, plovers' eggs, truffles, and various dressed vegetables, with many other things often

elaborately prepared, and highly ornamental, are moulded and served in it, especially at large _dejeuners_ and similar repasts. It is also much used to decorate raised pies, and hams; and for many other purposes of the table.

Calf's feet, 2; veal, 4 lbs.; ham, 3/4 lb.; onions, 2; carrots, 3; herbs, large bunch; mace, 3 blades; white whole pepper, 1 teaspoonful; water, 1 gallon: 5 to 6 hours. Whites of eggs, 4: 15 minutes.

CHAPTER V.

=Sauces.=

INTRODUCTORY REMARKS.

[Illustration:

Bain Marie, or Water Bath.]

THE difference between good and bad cookery can scarcely be more strikingly shown than in the manner in which sauces are prepared and served. If well made, appropriate to the dishes they accompany, and sent to table with them as hot as possible, they not only give a heightened relish to a dinner, but they prove that both skill and taste have been exerted in its arrangements. When coarsely or carelessly prepared, on the contrary, as they too often are, they greatly discredit the cook, and are anything but acceptable to the eaters. Melted butter, the most common of all—the "_one sauce of England_," as it is called by foreigners, and which forms in reality the basis of a large number of those which are served in this country—is often so ill prepared, being either oiled or lumpy, or composed principally of flour and water, that it says but little for the state of cookery amongst us. We trust that the receipts in the present chapter are so far clearly given, that if strictly followed they will materially assist the learner in preparing tolerably palatable sauces at the least. The cut at the commencement of the chapter exhibits a vessel called a _bain marie_, in which saucepans are placed when it is necessary to keep their contents hot without allowing them to boil: it is extremely useful when dinners are delayed after they are ready to serve.

TO THICKEN SAUCES.

When this is done with the yolks of eggs, they should first be well beaten, and then mixed with a spoonful of cold stock should it be at hand, and with one or two of the boiling sauce, which should be stirred very quickly to them, and they must in turn be stirred briskly to the sauce, which may be held over the fire, and well shaken for an instant afterwards, but never placed upon it, nor allowed to boil.

To the _roux_ or French thickening (which follows), the gravy or other liquid which is to be mixed with it should be poured boiling and in small quantities, the saucepan being often well shaken round, and the sauce made to boil up after each portion is added. If this precaution be observed, the butter will never float upon the surface, but the whole will be well and smoothly blended: it will otherwise be difficult to clear the sauce from it perfectly.

For invalids, or persons who object to butter in their soups or sauces, flour only mixed to a smooth batter, and stirred into the boiling liquid may be substituted for other thickening: arrow-root also used in the same way, will answer even better than flour.

FRENCH THICKENING, OR BROWN ROUX.

For ordinary purposes this may be made as it is wanted for use; but when it is required for various dishes at the same time or for cookery upon a large scale, it can be prepared at once in sufficient quantity to last for several days, and it will remain good for some time. Dissolve, with a very gentle degree of heat, half a pound of good butter, then draw it from the fire, skim it well, give time for it to settle, pour it gently from the sediment into a very clean frying-pan, and place it over a slow but clear fire. Put into a dredging box about seven ounces of fine dry flour; add it gradually to the butter, shake the pan often as it is thrown in, and keep the thickening constantly stirred until it has acquired a clear light brown colour. It should be very slowly and equally done, or its flavour will be unpleasant. Pour it into a jar, and stir a spoonful or two as it is needed into boiling soup or gravy. When the butter is not clarified it will absorb an additional ounce of flour, the whole of which ought to be fine and dry. This thickening may be made in a well-tinned stewpan even better than in a frying-pan, and if simmered over a coal fire it should be placed high above it, and well guarded from

smoke.

WHITE ROUX, OR FRENCH THICKENING.

Proceed exactly as for the preceding receipt, but dredge in the flour as soon as the butter is in full simmer, and be careful not to allow the thickening to take the slightest colour: this is used for white gravies or sauces.

SAUCE TOURNÉE, OR PALE THICKENED GRAVY.

Sauce tournée is nothing more than rich pale gravy made with veal or poultry (see _Consommé_, Chapter IV.) and thickened with delicate white _roux_. The French give it a flavouring of mushrooms and green onions, by boiling some of each in it for about half an hour before the sauce is served: it must then be strained, previously to being dished. Either first dissolve an ounce of butter, and then dredge gradually to it three-quarters of an ounce of flour, and proceed as for the preceding receipt; or blend the flour and butter perfectly with a knife before they are thrown into the stewpan, and keep them stirred without ceasing over a clear and gentle fire until they have simmered for some minutes, then place the stewpan high over the fire, and shake it constantly until the _roux_ has lost the raw taste of the flour; next, stir very gradually to it a pint of the gravy, which should be boiling. Set it by the side of the stove for a few minutes, skim it thoroughly, and serve it without delay.

Butter, 1 oz.; flour, 3/4 oz.; strong pale gravy, seasoned with mushrooms and green onions, 1 pint.

Obs. 3.—With the addition of three or four yolks of very fresh eggs, mixed with a seasoning of mace, cayenne, and lemon-juice, this becomes _German sauce_, now much used for fricassees, and other dishes; and minced parsley (boiled) and chili vinegar, each in sufficient quantity to flavour it agreeably, convert it into a good fish sauce.

BÉCHAMEL.

This is a fine French white sauce, now very much served at good English tables. It may be made in various ways, and more or less expensively; but it should always be thick, smooth, and rich, though delicate in flavour. The most ready mode of preparing it is to take an equal portion of very strong, pale veal gravy, and of good cream (a pint of each for example), and then, by rapid boiling over a very clear fire, to reduce the gravy nearly half; next, to mix with part of the cream a tablespoonful of fine dry flour, to pour it to the remainder, when it boils, and to keep the whole stirred for five minutes or more over a slow fire, for if placed upon a fierce one it would be liable to burn; then to add the gravy, to stir and mix the sauce perfectly, and to simmer it for a few minutes longer. All the flavour should be given by the gravy, in which French cooks boil a handful of mushrooms, a _few_ green onions, and some branches of parsley before it is reduced: but a good _béchamel_ may be made without them, with a strong _consommé_ (see pale veal gravy, page 98) well reduced.

Strong pale veal gravy (flavoured with mushrooms or not), 1 pint: reduced half. Rich cream, 1 pint; flour, 1 tablespoonful: 5 minutes. With gravy, 4 or 5 minutes.

Obs.—_Velouté_, which is a rather thinner sauce or gravy, is made by simply well reducing the cream and stock separately, and then mixing them together without any thickening.

BÉCHAMEL MAIGRE.

(_A cheap White Sauce._)

A good _béchamel_ may be made entirely without meat, when economy is an object, or when no gravy is at hand. Put into a stewpan, or a well-tinned and thick saucepan, with from two to three ounces of butter, a carrot, and a couple of small onions, cut in slices, with a handful of nicely-cleaned mushroom buttons, when these last can be easily procured; and when they have stewed slowly for half an hour, or until the butter is nearly dried up, stir in two tablespoonsful of flour, and pour in a pint of new milk, a little at a time, shaking the stewpan well round, that the sauce may be smooth. Boil the _béchamel_ gently for half an hour; add a little salt, and cayenne; strain, and reduce it, if not quite thick, or pour it boiling to the yolks of two fresh eggs.

ANOTHER COMMON BÉCHAMEL.

Cut half a pound of veal, and a slice of lean ham or smoked beef, into small dice, and stew them in butter, with vegetables, as directed in the foregoing receipt: stir in the same proportion of flour, then add the milk, and let the sauce boil very gently for an hour.

It should not be allowed to thicken too much before it is strained.

Obs.—Common _béchamel_, with the addition of a spoonful of made-mustard, is an excellent sauce for boiled mutton.

RICH MELTED BUTTER.

This is more particularly required in general for lobster sauce, when it is to be served with turbot or brill, and for good oyster sauce. Salmon is itself so rich, that less butter is needed for it than for sauce which is to accompany a drier fish. Mix to a very smooth batter a dessertspoonful of flour, a half-saltspoonful of salt, and half a pint of cold water: put these into a delicately clean saucepan, with from four to six ounces of well-flavoured butter, cut into small bits, and shake the sauce strongly round, almost without cessation, until the ingredients are perfectly blended, and it is on the point of boiling; let it simmer for two or three minutes, and it will be ready for use. The best French cooks recommend its not being allowed to _boil_, as they say it tastes less of flour if served when it is just at the point of simmering.

Cold water, 1/2 pint; salt, 1/2 spoonful; flour, 1 dessertspoonful: 3 to 4 minutes. Butter, 4 to 6 oz.

MELTED BUTTER.

(_A good common Receipt._)

Put into a basin a large teaspoonful of flour, and a little salt, then mix with them very gradually and very smoothly a quarter of a pint of cold water; turn these into a small clean saucepan, and shake or stir them constantly over a clear fire until they have boiled a couple of minutes, then add an ounce and a half of butter cut small, keep the sauce stirred until this is entirely dissolved, give the whole a minute's boil, and serve it quickly. The more usual mode is to put the butter in at first with the flour and water; but for inexperienced or unskilful cooks the safer plan is to follow the present receipt.

Water, 1/4 pint; flour, 1 teaspoonful: 2 minutes. Butter, 1-1/2 oz.; 1 minute.

Obs.—To render this a _rich_ sauce, increase or even _double_ the proportion of butter.

FRENCH MELTED BUTTER.

Pour half a pint of good but not very thick, boiling melted butter to the well-beaten yolks of two or three fresh eggs, and stir them briskly as it is added; put the sauce again into the saucepan, and shake it high over the fire for an instant, but do not allow it to boil or it will curdle. Add a little lemon-juice or vinegar, and serve it immediately.

NORFOLK SAUCE, OR RICH MELTED BUTTER WITHOUT FLOUR.

Put three tablespoonsful of water into a small saucepan, and when it boils add four ounces of fresh butter; as soon as this is quite dissolved, take the saucepan from the fire, and shake it round until the sauce looks thick and smooth. It must not be allowed to boil after the butter is added.

Water, 3 tablespoonsful; butter, 4 oz.

WHITE MELTED BUTTER.

Thicken half a pint of new milk with rather less flour than is directed for the common melted butter, or with a little arrow-root, and stir into it by degrees after it has boiled, a couple of ounces of fresh butter cut small; do not cease to stir the sauce until this is entirely dissolved, or it may become oiled, and float upon the top Thin cream, substituted for the milk, and flavoured with a few strips of lemon-rind cut extremely thin, some salt, and a small quantity of pounded mace, if mixed with rather less flour, and the same proportion of butter, will make an excellent sauce to serve with fowls or other dishes, when no gravy is at hand to make white sauce in the usual way.

BURNT OR BROWNED BUTTER.

Melt in a frying-pan three ounces of fresh butter, and keep it stirred slowly over a gentle fire until it is of a dark brown colour; then pour to it a couple of tablespoonsful of good _hot_ vinegar, and season it with black pepper and a little salt. In France this is a favourite sauce with boiled skate, which is served with plenty of crisped parsley, in addition, strewed over it. It is also often poured

over poached eggs there: it is called _beurre noir_.

Butter, 3 oz.; vinegar, 2 tablespoonsful; pepper; salt.

CLARIFIED BUTTER.

Put the butter into a very clean and well-tinned saucepan or enamelled stewpan, and melt it gently over a clear fire; when it just begins to simmer, skim it thoroughly, draw it from the fire, and let it stand a few minutes that the buttermilk may sink to the bottom; then pour it clear of the sediment through a muslin strainer or a fine hair-sieve; put it into jars, and store them in a cool place. Butter thus prepared will answer for all the ordinary purposes of cookery, and remain good for a great length of time. In France, large quantities are melted down in autumn for winter use. The clarified butter ordered for the various receipts in this volume, is merely dissolved with a gentle degree of heat in a small saucepan, skimmed, and poured out for use, leaving the thick sediment behind.

VERY GOOD EGG SAUCE.

Boil four fresh eggs for quite fifteen minutes, then lay them into plenty of fresh water, and let them remain until they are perfectly cold. Break the shells by rolling them on a table, take them off, separate the whites from the yolks, and divide all of the latter into quarter-inch dice; mince two of the whites tolerably small, mix them lightly, and stir them into the third of a pint of rich melted butter or of white sauce: serve the whole as hot as possible.

Eggs, 4: boiled 15 minutes, left till cold. The yolks of all, whites of 2; third of pint of good melted butter or white sauce. Salt as needed.

SAUCE OF TURKEYS' EGGS.

(_Excellent._)

The eggs of the turkey make a sauce much superior to those of the common fowl. They should be gently boiled in plenty of water for twenty minutes. The yolks of three, and the whites of one and a half, will make a very rich sauce if prepared by the directions of the foregoing receipt. The eggs of the guinea fowl also may be converted into a similar sauce with ten minutes' boiling. Their delicate size will render it necessary to increase the number taken for it.

COMMON EGG SAUCE.

Boil a couple of eggs hard, and when quite cold cut the whites and yolks separately; mix them well, put them into a very hot tureen, and pour boiling to them a quarter of a pint of melted butter, stir, and serve the sauce immediately.

Whole eggs, 2; melted butter, 1/4 pint.

EGG SAUCE FOR CALF'S HEAD.

This is a provincial sauce, served sometimes with fish, and with calf's head likewise. Thicken to the proper consistence with flour and butter some good pale veal gravy, throw into it when it boils from one to two large teaspoonsful of minced parsley, add a slight squeeze of lemon-juice, a little cayenne, and then the eggs.

Veal gravy, 1/2 pint; flour, 1-1/2 oz.; butter, 2 oz.; minced parsley, 1 dessertspoonful; lemon-juice, 1 teaspoonful; little cayenne; eggs, 3 to 4.

ENGLISH WHITE SAUCE.

Boil softly in half a pint of well-flavoured pale veal gravy a few very thin strips of fresh lemon-rind, for just sufficient time to give their flavour to it; stir in a thickening of arrow-root, or of flour and butter, add salt if needed, and mix with the gravy a quarter of a pint of boiling cream. For the best kind of white sauce, see béchamel, page 107.

Good pale veal gravy, 1/2 pint; third of 1 lemon-rind: 15 to 20 minutes. Freshly pounded mace, third of saltspoonful; butter, 1 to 2 oz.; flour, 1 teaspoonful (or arrow-root an equal quantity); cream, 1/4 pint.

VERY COMMON WHITE SAUCE.

The neck and the feet of a fowl, nicely cleaned, and stewed down in half a pint of water, until it is reduced to less than a quarter of a pint, with a thin strip or two of lemon-rind, a small blade of mace, a small branch or two of parsley, a little salt, and half a dozen corns of pepper, then strained, thickened, and flavoured by the preceding receipt, and mixed with something more than half the quantity of cream, will answer for this sauce extremely well; and if it be added, when made, to the liver of the chicken, previously boiled for six minutes in the gravy, then bruised to a smooth paste, and passed through a sieve, an excellent liver sauce. A little strained lemon-juice is generally added to it when it is ready to serve: it should be stirred very briskly in.

DUTCH SAUCE.

Put into a small saucepan the yolks of three fresh eggs, the juice of a large lemon, three ounces of butter, a little salt and nutmeg, and a wineglassful of water. Hold the saucepan over a clear fire, and keep the sauce stirred until it _nearly_ boils: a little cayenne may be added. The safest way of making all sauces that will curdle by being allowed to boil, is to put them into a jar, and to set the jar over the fire in a saucepan of boiling water, and then to stir the ingredients constantly until the sauce is thickened sufficiently to serve.

Yolks of eggs, 3; juice, 1 lemon; butter, 3 oz.; little salt and nutmeg; water, 1 wineglassful; cayenne at pleasure.

Obs.—A small cupful of veal gravy, mixed with plenty of blanched and chopped parsley, may be used instead of water for this sauce, when it is to be served with boiled veal, or with calf's head.

FRICASSEE SAUCE.

Stir briskly, but by degrees, to the well-beaten yolks of two large or of three small fresh eggs, half a pint of common English white sauce; put it again into the saucepan, give it a shake over the fire, but be extremely careful not to allow it to boil, and just before it is served stir in a dessertspoonful of strained lemon-juice. When meat or chickens are fricasseed, they should be lifted from the saucepan with a slice, drained on it from the sauce, and laid into a very hot dish before the eggs are added, and when these are just set, the sauce should be poured on them.

BREAD SAUCE.

Pour quite boiling, on half a pint of the finest bread-crumbs, an equal measure of new milk; cover them closely with a plate, and let the sauce remain for twenty or thirty minutes; put it then into a delicately clean saucepan, with a small saltspoonful of salt, half as much pounded mace, a little cayenne, and about an ounce of fresh butter; keep it stirred constantly over a clear fire for a few minutes, then mix with it a couple of spoonsful of good cream, give it a boil, and serve it immediately. When cream is not to be had, an additional spoonful or two of milk must be used. The bread used for sauce should be _stale_, and lightly grated down into extremely small crumbs, or the preparation will look rough when sent to table. Not only the crust, but all heavy-looking or imperfectly baked portions of it, should be entirely pared off, and it should be pressed against the grater only so much as will reduce it easily into crumbs. When stale bread cannot be procured, the new should be sliced thin, or broken up small, and beaten quite smooth with a fork after it has been soaked. As some will absorb more liquid than others, the cook must increase a little the above proportion should it be needed. Equal parts of milk and of thin cream make an excellent bread sauce: more butter can be used to enrich it when it is liked.

Bread-crumbs and new milk, each 1/2 pint (or any other measure); soaked 20 to 30 minutes, or more. Salt, small saltspoonful; mace, half as much; little cayenne; butter, 1 oz.; boiled 4 to 5 minutes. 2 to 4 spoonsful of good cream (or milk): 1 minute. Or: bread-crumbs, 1/2 pint; milk and cream, each 1/4 pint; and from 2 to 4 spoonsful of either in addition.

Obs.—Very pale, strong veal gravy is sometimes poured on the bread-crumbs, instead of milk; and these, after being soaked, are boiled extremely dry, and then brought to the proper consistence with rich cream. The gravy may be highly flavoured with mushrooms when this is done.

BREAD SAUCE WITH ONION.

Put into a very clean saucepan nearly half a pint of fine bread-crumbs, and the white part of a large _mild_ onion cut into quarters; pour to these three-quarters of a pint of new milk, and boil them very gently, keeping them often stirred until the onion is perfectly tender, which will be in from forty minutes to an hour. Press the whole through a hair-sieve, which should be as clean as possible; reduce the sauce by quick boiling should it be too thin; add a seasoning of salt and grated nutmeg, an ounce of butter, and four

spoonsful of cream; and when it is of a proper thickness, dish, and send it quickly to table.

Bread-crumbs, nearly 1/2 pint; white part of 1 large mild onion; new milk, 3/4 pint: 40 to 60 minutes. Seasoning of salt and grated nutmeg; butter, 1 oz.; cream, 4 tablespoonsful: to be boiled till of a proper consistence.

Obs.—This is an excellent sauce for those who like a _subdued_ flavour of onion in it; but as many persons object to any, the cook should ascertain whether it be liked before she follows this receipt.

COMMON LOBSTER SAUCE.

Add to half a pint of good melted butter a tablespoonful of essence of anchovies, a small half-saltspoonful of freshly pounded mace, and less than a quarter one of cayenne. If a couple of spoonsful of cream should be at hand, stir them to the sauce when it boils; then put in the flesh of the tail and claws of a small lobster cut into dice (or any other form) of equal size. Keep the saucepan by the side of the fire until the fish is quite heated through, but do not let the sauce boil again: serve it very hot. A small quantity can be made on occasion with the remains of a lobster which has been served at table.

Melted butter, 1/2 pint; essence of anchovies, 1 tablespoonful; pounded mace, small 1/2 saltspoonful; less than 1/4 one of cayenne; cream (if added), 2 tablespoonsful; flesh of small lobster.

GOOD LOBSTER SAUCE.

Select for this a perfectly fresh hen lobster; split the tail carefully, and take out the inside coral; pound half of it in a mortar very smoothly with less than an ounce of butter, rub it through a hair-sieve, and put it aside. Cut the firm flesh of the fish into dice of not less than half an inch in size; and when these are ready, make as much _good_ melted butter as will supply the quantity of sauce required for table, and if to be served with a turbot or other large fish to a numerous company, let it be plentifully provided. Season it slightly with essence of anchovies, and well with cayenne, mace, and salt; add to it a few spoonsful of rich cream, and then mix a small portion of it very gradually with the pounded coral; when this is sufficiently liquefied pour it into the sauce, and stir the whole well together; put in immediately the flesh of the fish, and heat the sauce thoroughly by the side of the fire without allowing it to boil, for if it should do so its fine colour would be destroyed. The whole of the coral may be used for the sauce when no portion of it is required for other purposes.

CRAB SAUCE.

The flesh of a fresh well-conditioned crab of moderate size is more tender and delicate than that of a lobster, and may be converted into an excellent fish sauce. Divide it into small flakes, and add it to some good melted butter, which has been flavoured as for either of the sauces above. A portion of the cream contained in the fish may first be smoothly mingled with the sauce.

GOOD OYSTER SAUCE.

At the moment they are wanted for use, open three dozen of fine plump native oysters; save carefully and strain their liquor, rinse them separately in it, put them into a very clean saucepan, strain the liquor again, and pour it to them; heat them slowly, and keep them from one to two minutes at the simmering point, without allowing them to _boil_, as that will render them hard. Lift them out and beard them neatly; add to the liquor three ounces of butter smoothly mixed with a large dessertspoonful of flour; stir these without ceasing until they boil, and are perfectly mixed; then add to them gradually a quarter of a pint, or rather more, of new milk, or of thin cream (or equal parts of both), and continue the stirring until the sauce boils again; add a little salt, should it be needed, and a small quantity of cayenne in the finest powder; put in the oysters, and keep the saucepan by the side of the fire until the whole is thoroughly hot and begins to simmer, then turn the sauce into a well-heated tureen, and send it immediately to table.

Small plump oysters, 3 dozen; butter, 3 oz.; flour, 1 large dessertspoonful; the oyster liquor; milk or cream, full 1/4 pint; little salt and cayenne.

COMMON OYSTER SAUCE.

Prepare and plump two dozen of oysters as directed in the receipt above; add their strained liquor to a quarter of a pint of _thick_ melted butter made with milk, or with half milk and half water; stir the whole until it boils, put in the oysters, and when they are quite heated through send the sauce to table without delay. Some persons like a little cayenne and essence of anchovies added to it when it is served with fish; others prefer the unmixed flavour of the oysters.

Oysters, 2 dozens; their liquor; melted butter, 1/4 pint. (Little cayenne and 1 dessertspoonful of essence of anchovies when liked.)

SHRIMP SAUCE.

The fish for this sauce should be very fresh. Shell quickly one pint of shrimps and mix them with half a pint of melted butter, to which a few drops of essence of anchovies and a little mace and cayenne have been added. As soon as the shrimps are heated through, dish, and serve the sauce, which ought not to boil after they are put in. Many persons add a few spoonsful of rich cream to all shell-fish sauces. Shrimps, 1 pint; melted butter, 1/2 pint; essence of anchovies, 1 teaspoonful; mace, 1/4 teaspoonful; cayenne, very little.

ANCHOVY SAUCE.

To half a pint of good melted butter add three dessertspoonsful of essence of anchovies, a quarter of a teaspoonful of mace, and a rather high seasoning of cayenne; or pound the flesh of two or three fine mellow anchovies very smooth, mix it with the boiling butter, simmer these for a minute or two, strain the sauce if needful, add the spices, give it a boil, and serve it.

Melted butter, 1/2 pint; essence of anchovies, 3 dessertspoonsful; mace, 1/4 teaspoonful; cayenne, to taste. Or, 3 large anchovies finely pounded, and the same proportions of butter and spice.

CREAM SAUCE FOR FISH.

Knead very smoothly together with a strong-bladed knife, a _large_ teaspoonful of flour with three ounces of good butter; stir them in a very clean saucepan or stewpan over a gentle fire until the butter is dissolved, then throw in a little salt and some cayenne, give the whole one minute’s simmer, and add, very gradually, half a pint of good cream; keep the sauce constantly stirred until it boils, then mix with it a dessertspoonful of essence of anchovies, and half as much chili vinegar or lemon-juice. The addition of shelled shrimps or lobsters cut in dice, will convert this at once into a most excellent sauce of either. Pounded mace may be added to it with the cayenne; and it may be thinned with a few spoonsful of milk should it be too thick. Omit the essence of anchovies, and mix with it some parsley boiled very green and minced, and it becomes a good sauce for poultry.

Butter, 3 oz.; flour, 1 _large_ teaspoonful: 2 to 3 minutes. Cream, 1/2 pint; essence of anchovies, 1 large dessertspoonful (more if liked); chili vinegar or lemon-juice, 1 teaspoonful; salt, 1/4 saltspoonful.

SHARP MAÎTRE D’HÔTEL SAUCE.

(_English Receipt._)

For a rich sauce of this kind, mix a dessertspoonful of flour with four ounces of good butter, but with from two to three ounces only for common occasions; knead them together until they resemble a smooth paste, then proceed exactly as for the sauce above, but substitute good pale veal gravy, or strong, pure-flavoured veal broth, or shin of beef stock (which if well made has little colour), for the cream; and when these have boiled for two or three minutes, stir in a tablespoonful of common vinegar and one of chili vinegar, with as much cayenne as will flavour the sauce well, and some salt, should it be needed; throw in from two to three dessertspoonsful of finely-minced parsley, give the whole a boil, and it will be ready to serve. A tablespoonful of mushroom catsup or of Harvey’s sauce may be added with the vinegar when the colour of the sauce is immaterial. It may be served with boiled calf’s head, or with boiled eels with good effect; and various kinds of cold meat and fish may be re-warmed for table in it, as we have directed in another part of this volume. With a little more flour, and a flavouring of essence of anchovies, it will make, without the parsley, an excellent sauce for these last, when they are first dressed.

Butter, 2 to 4 oz.; flour, 1 dessertspoonful; pale veal gravy or strong broth, or shin of beef stock, 1/2 pint; cayenne; salt, if needed; common vinegar, 1 tablespoonful; chili vinegar, 1 tablespoonful. (Catsup or Harvey’s sauce, according to circumstances.)

FRENCH MAÎTRE D’HÔTEL,[55] OR STEWARD’S SAUCE.

Footnote 55:

The Maître d’Hôtel is, properly, the _House Steward_.

Add to half a pint of rich, pale veal gravy, well thickened with the white _roux_ of page 108, a good seasoning of pepper, salt, minced parsley, and lemon-juice; or make the thickening with a small tablespoonful of flour, and a couple of ounces of butter; keep these stirred constantly over a very gentle fire from ten to fifteen minutes, then pour the gravy to them boiling, in small portions, mixing the whole well as it is added, and letting it boil up between each, for unless this be done the butter will be likely to float upon the surface. Simmer the sauce for a few minutes, and skim it well, then add salt should it be needed, a tolerable seasoning of pepper or of cayenne in fine powder, from two to three teaspoonsful of minced parsley, and the strained juice of a small lemon. For some dishes, this sauce is thickened with the yolks of eggs, about four to the pint. The French work into their sauces generally a small bit of fresh butter just before they are taken from the fire, to give them mellowness: this is done usually for the _Maître d'Hôtel Sauce_.

MAÎTRE D'HÔTEL SAUCE MAIGRE,[56] OR WITHOUT GRAVY.

Footnote 56:

Maigre, made without meat.

Substitute half a pint of good melted butter for the gravy, and add to it the same seasonings as above. A double quantity of these sauces will be needed when they are required to cover a large fish; in that case they should be thick enough to adhere to it well. Melted butter, 1/2 pint; seasoning of salt and pepper, or cayenne; minced parsley, 2 to 3 teaspoonsful; juice, 1 small lemon.

For COLD MAÎTRE D'HÔTEL SAUCE, see Chapter VI.

THE LADY'S SAUCE.

(_For Fish._)

Pound to a very smooth paste the inside coral of a lobster with a small slice of butter, and some cayenne; rub it through a hair-sieve, gather it together, and mix it very smoothly with from half to three-quarters of a pint of _sauce tournée_ or of cream fish-sauce, previously well seasoned with cayenne and salt, and moderately with pounded mace; bring it to the _point_ of boiling only; stir in quickly, but gradually, a tablespoonful of strained lemon-juice, and serve it very hot. When neither cream nor gravy is at hand, substitute _rich_ melted butter mixed with a dessertspoonful or two of essence of anchovies, and well seasoned. The fine colour of the coral will be destroyed by boiling. This sauce, which the French call _Sauce à l'Aurore_, may be served with brill, boiled soles, gray mullet, and some few other kinds of fish: it is quickly made when the lobster butter of Chapter VI. is in the house.

Coral of lobster, pounded; cream sauce, or _sauce tournée_ (thickened pale veal gravy), 1/2 to 3/4 pint; lemon-juice, 1 tablespoonful; salt, cayenne, and mace, as needed. Or: _rich_ melted butter, instead of other sauce; essence of anchovies, 2 dessertspoonsful; other seasoning, as above.

Obs.—The proportion of spices here must, of course, depend on the flavouring which the gravy or sauce may already have received.

GENEVESE SAUCE, OR SAUCE GÉNÉVOISE.

Cut into dice three ounces of the lean of a well-flavoured ham, and put them with half a small carrot, four cloves, a blade of mace, two or three very small sprigs of lemon thyme and of parsley, and rather more than an ounce of butter, into a stewpan; just simmer them from three-quarters of an hour to a whole hour, then stir in a teaspoonful of flour; continue the slow stewing for about five minutes, and pour in by degrees a pint of good boiling veal gravy, and let the sauce again simmer softly for nearly an hour. Strain it off, heat it in a clean saucepan, and when it boils, stir in a wineglassful and a half of good sherry or Madeira, two tablespoonsful of lemon-juice, some cayenne, a little salt if needed, and a small tablespoonful of flour very smoothly mixed with two ounces of butter. Give the whole a boil after the thickening is added, pour a portion of the sauce over the fish (it is served principally with salmon and trout), and send the remainder very hot to table in a tureen.

Lean of ham, 3 oz.; 1/2 small carrot; 4 to 6 cloves; mace, 1 large blade; thyme and parsley, 3 or 4 _small_ sprigs of each; butter, 1 to 1-1/2 oz.: 50 to 60 minutes. Veal gravy, 1 pint: 3/4 to 1 hour. Sherry or Madeira, 1-1/2 glassful; lemon-juice, 2 tablespoonsful; seasoning of cayenne and salt; flour, 1 tablespoonful; butter, 2 oz.: 1 minute.

Obs.—A teaspoonful or more of essence of anchovies is usually added to the sauce, though it is scarcely required.

SAUCE ROBERT.

Cut four or five large onions into small dice, and brown them in a stewpan, with three ounces of butter and a dessertspoonful of flour. When of a deep yellow brown, pour to them half a pint of beef or of veal gravy, and let them simmer for fifteen minutes; skim the sauce, add a seasoning of salt and pepper, and at the moment of serving, mix a dessertspoonful of made mustard with it.

Large onions, 4 or 5; butter, 3 oz.; flour, dessertspoonful; 10 to 15 minutes. Gravy, 1/2 pint: 15 minutes. Mustard, dessertspoonful.

SAUCE PIQUANTE.

Brown lightly in an ounce and a half of butter a tablespoonful of minced eschalots or three of onions; add a teaspoonful of flour when they are partially done; pour to them half a pint of gravy or of _good_ broth, and when it boils add three chilies, a bay-leaf, and a very small bunch of thyme. Let these simmer for twenty minutes; take out the thyme and bay-leaf, add a high seasoning of black pepper, and half a wineglassful of the best vinegar. A quarter of a teaspoonful of cayenne may be substituted for the chilies.

Eschalots, 1 tablespoonful, or three of onions; flour, 1 teaspoonful; butter, 1-1/2 oz.: 10 to 15 minutes. Gravy or broth, 1/2 pint; chilies, 3; bay-leaf; thyme, small bunch: 20 minutes. Pepper, plenty; vinegar, 1/2 wineglassful.

EXCELLENT HORSERADISH SAUCE.

(_To serve hot or cold with roast beef._)

Wash and wipe a stick of _young_ horseradish, scrape off the outer skin, grate it as small as possible on a fine grater, then with two ounces (or a couple of large tablespoonsful) of it mix a small teaspoonful of salt and four tablespoonsful of good cream; stir in briskly, and by degrees, three dessertspoonsful of vinegar, one of which should be chili vinegar when the horseradish is mild. To heat the sauce, put it into a small and delicately clean saucepan, hold it over, but do not place it _upon_ the fire, and stir it without intermission until it is near the point of simmering; but do not allow it to boil, or it will curdle instantly.

Horseradish pulp, 2 oz. (or 2 _large_ tablespoonsful); salt, 1 teaspoonful; good cream, 4 tablespoonsful; vinegar, 3 dessertspoonsful (of which one should be chili when the root is mild).

Obs.—Common English salad-mixture is often added to the grated horseradish when the sauce is to be served cold.

HOT HORSERADISH SAUCE.

(_To serve with boiled or stewed meat or fish._)

Mix three ounces of young tender grated horseradish with half a pint of good brown gravy, and let it stand by the side of the fire until it is on the point of boiling; add salt if required, a teaspoonful of made mustard, and a dessertspoonful of garlic or of eschalot vinegar; or the same quantity of chili vinegar, or twice as much common vinegar.

Some cooks stew the horseradish in vinegar for ten minutes, and, after having drained it from this, mix it with nearly half a pint of thick melted butter.

Horseradish, grated, 3 oz.; brown gravy, 1/2 pint; made mustard, 1 teaspoonful; eschalot or garlic vinegar, 1 dessertspoonful (or chili vinegar, the same quantity, or common vinegar twice as much).

CHRISTOPHER NORTH’S OWN SAUCE FOR MANY MEATS.

Throw into a small basin a heaped saltspoonful of _good_ cayenne pepper, in very fine powder, and half the quantity of salt;[57] add a small dessertspoonful of well-refined, pounded, and sifted sugar; mix these thoroughly; then pour in a tablespoonful of the strained juice of a fresh lemon, two of Harvey’s sauce, a teaspoonful of the very best mushroom catsup (or of cavice), and a small wineglassful of port wine. Heat the sauce by placing the basin in a saucepan of boiling water, or turn it into a jar, and place this in the water. Serve it directly it is ready with geese or ducks, tame or wild; roast pork, venison, fawn, a grilled blade-bone, or any other broil. A slight flavour of garlic or eschalot vinegar may be given to it at pleasure. Some persons eat it with fish. It is good cold; and, if bottled directly it is made, may be stored for several days. It is the better for being mixed some hours before it is served. _The proportion of cayenne may be doubled when a very pungent sauce is desired._

Footnote 57:

Characteristically, the salt of this sauce ought, perhaps, to prevail more strongly over the _sugar_, but it will be found for most tastes sufficiently _piquant_ as it is.

Good cayenne pepper in fine powder, 1 _heaped_ saltspoonful; salt, half as much; pounded sugar, 1 small dessertspoonful; strained lemon-juice, 1 tablespoonful; Harvey's sauce, 2 tablespoonsful; best mushroom catsup (or cavice), 1 teaspoonful; port wine, 3 tablespoonsful, or small wineglassful. (Little eschalot, or garlic vinegar at pleasure.)

Obs.—This sauce is exceedingly good mixed with the brown gravy of a hash or stew, or with that which is served with game or other dishes.

GOOSEBERRY SAUCE FOR MACKEREL.

Cut the stalks and tops from half to a whole pint of quite young gooseberries, wash them well, just cover them with cold water, and boil them very gently indeed, until they are tender; drain and mix them with a small quantity of melted butter, made with rather less flour than usual. Some eaters prefer the mashed gooseberries without any addition; others like that of a little ginger. The best way of making this sauce is to turn the gooseberries into a hair-sieve to drain, then to press them through it with a wooden spoon, and to stir them in a clean stewpan or saucepan over the fire with from half to a whole teaspoonful of sugar, just to soften their extreme acidity, and a bit of fresh butter about the size of a walnut. When the fruit is not passed through the sieve it is an improvement to seed it.

COMMON SORREL SAUCE.

Strip from the stalks and the large fibres, from one to a couple of quarts of freshly-gathered sorrel; wash it very clean, and put it into a well-tinned stewpan or saucepan (or into an enamelled one, which would be far better), without any water; add to it a small slice of good butter, some pepper and salt, and stew it gently, keeping it well stirred until it is exceedingly tender, that it may not burn; then drain it on a sieve, or press the liquid well from it; chop it as fine as possible, and boil it again for a few minutes with a spoonful or two of gravy, or the same quantity of cream or milk, mixed with a half-teaspoonful of flour, or with only a fresh slice of good butter. The beaten yolk of an egg or two stirred in just as the sorrel is taken from the fire will soften the sauce greatly, and a saltspoonful of pounded sugar will also be an improvement.

ASPARAGUS SAUCE, FOR LAMB CUTLETS.

Green cut the tender points of some young asparagus into half-inch lengths, or into the size of peas only; wash them well, then drain and throw them into plenty of boiling salt and water. When they are quite tender, which may be in from ten to fifteen minutes, turn them into a hot strainer and drain the water thoroughly from them; put them, at the instant of serving, into half a pint of thickened veal gravy (see _sauce tournée_, page 106), mixed with the yolks of a couple of eggs, and well seasoned with salt and cayenne, or white pepper, or into an equal quantity of good melted butter: add to this last a squeeze of lemon-juice. The asparagus will become yellow if reboiled, or if left long in the sauce before it is served.

Asparagus points, 1/2 pint: boiled 10 to 15 minutes, longer if not quite tender. Thickened veal gravy, 1/2 pint; yolks of eggs, 2. Or: good melted butter, 1/2 pint; lemon-juice, small dessertspoonful, seasoning of salt and white pepper.

CAPER SAUCE.

Stir into the third of a pint of good melted butter from three to four dessertspoonsful of capers; add a little of the vinegar, and dish the sauce as soon as it boils. Keep it stirred after the berries are added: part of them may be minced and a little chill vinegar substituted for their own. Pickled nasturtiums make a very good sauce, and their flavour is sometimes preferred to that of the capers. For a large joint, increase the quantity of butter to half a pint.

Melted butter, third of pint; capers, 3 to 4 dessertspoonsful.

BROWN CAPER SAUCE.

Thicken half a pint of good veal or beef gravy as directed for _sauce tournée_, and add to it two tablespoonsful of capers, and a dessertspoonful of the pickle liquor, or of chili vinegar, with some cayenne if the former be used, and a proper seasoning of salt.

Thickened veal, or beef gravy, 1/2 pint; capers, 2 tablespoonsful; caper liquor or chili vinegar, 1 dessertspoonful.

CAPER SAUCE FOR FISH.

To nearly half a pint of very rich melted butter add six spoonsful of _strong_ veal gravy or jelly, a tablespoonful of essence of anchovies, and some chili vinegar or cayenne, and from two to three tablespoonsful of capers. When there is no gravy at hand substitute a half wineglassful of mushroom catsup, or of Harvey's sauce; though these deepen the colour more than is desirable.

COMMON CUCUMBER SAUCE.

Pare, slice, dust slightly with pepper and with flour, two or three young cucumbers, and fry them a fine brown in a little butter, or dissolve an ounce and a half in a small stewpan or iron saucepan, and shake them in it over a brisk fire from twelve to fifteen minutes; pour to them by degrees nearly half a pint of strong beef broth, or of brown gravy; add salt, and more pepper if required; stew the whole for five minutes, and send the sauce very hot to table. A minced onion may be browned with the cucumbers when it is liked, and a spoonful of vinegar added to them before they are served.

Cucumbers, 2 or 3; butter, 1-1/2 oz.; broth or gravy, nearly 1/2 pint; salt, pepper.

ANOTHER COMMON SAUCE OF CUCUMBERS.

Cucumbers which have the fewest seeds are best for this sauce. Pare and slice _two_ or _three_, should they be small, and put them into a saucepan, in which two ounces, or rather more, of butter have been dissolved, and are beginning to boil; place them high over the fire, that they may stew as softly as possible, without taking colour, for three-quarters of an hour, or longer should they require it; add to them a good seasoning of white pepper and some salt, when they are half done; and just before they are served stir to them half a teaspoonful of flour, mixed with a morsel of butter; strew in some minced parsley, give it a boil, and finish with a spoonful of good vinegar.

WHITE CUCUMBER SAUCE.

Quarter some young quickly-grown cucumbers, without many seeds in them; empty them of these, and take off the rinds. Cut them into inch lengths, and boil them from fifteen to eighteen minutes in salt and water; press the water from them with the back of a spoon, and work them through a sieve; mix them with a few spoonsful of _béchamel_, or thick white sauce; do not let them _boil_ again, but serve them very hot. A sauce of better flavour is made by boiling the cucumbers in veal gravy well seasoned, and stirring in the beaten yolks of two or three eggs, and a little chili vinegar or lemon-juice, at the instant of serving. Another also of cucumbers sliced, and stewed in butter, but without being at all browned, and then boiled in pale veal gravy, which must be thickened with rich cream, is excellent. A _morsel_ of sugar improves this sauce.

Cucumbers, 3: 15 to 18 minutes. White sauce, 1/4 pint.

WHITE MUSHROOM SAUCE.

Cut off the stems closely from half a pint of small button mushrooms; clean them with a little salt and a bit of flannel, and throw them into cold water, slightly salted, as they are done; drain them well, or dry them in a soft cloth, and throw them into half a pint of boiling _béchamel_ (see page 108), or of white sauce made with very fresh milk, or thin cream, thickened with a tablespoonful of flour and two ounces of butter. Simmer the mushrooms from ten to twenty minutes, or until they are quite tender, and dish the sauce, which should be properly seasoned with salt, mace, and cayenne.

Mushrooms, 1/2 pint; white sauce, 1/2 pint; seasoning of salt, mace, and cayenne: 10 minutes.

ANOTHER MUSHROOM SAUCE.

Prepare from half to a whole pint of very small mushroom-buttons with great nicety, and throw them into an equal quantity of _sauce tournée_; when they are tender add a few spoonsful of rich cream, give the whole a boil, and serve it. Either of these sauces may be sent to table with boiled poultry, breast of veal, or veal cutlets: the _sauce tournée_ should be thickened rather more than usual when it is to be used in this receipt.

Mushrooms and _sauce tournée_ each, 1/2 to whole pint: stewed till tender. Cream, 4 to 8 tablespoonsful.

BROWN MUSHROOM SAUCE.

Very small flaps, peeled and freed entirely from the fur, will answer for this sauce. Leave them whole or quarter them, and stew them tender in some rich brown gravy; give a full seasoning of mace and cayenne, add thickening and salt if needed, and a tablespoonful of good mushroom catsup.

COMMON TOMATA SAUCE.

Tomatas are so juicy when ripe that they require little or no liquid to reduce them to a proper consistence for sauce; and they vary so exceedingly in size and quality that it is difficult to give precise directions for the exact quantity which in their unripe state is needed for them. Take off the stalks, halve the tomatas, and gently squeeze out the seeds and watery pulp; then stew them softly with a few spoonsful of gravy or of strong broth until they are quite melted. Press the whole through a hair-sieve, and heat it afresh with a little additional gravy should it be too thick, and some cayenne, and salt. Serve it very hot.

Fine ripe tomatas, 6 or 8; gravy or strong broth, 4 tablespoonsful: 1/2 to 3/4 hour, or longer if needed. Salt and cayenne sufficient to season the sauce, and two or three spoonsful more of gravy if required.

Obs.—For a large tureen of this sauce, increase the proportions; and should it be at first too liquid, reduce it by quick boiling. When neither gravy nor broth is at hand, the tomatas may be stewed perfectly tender, but very gently, in a couple of ounces of butter, with some cayenne and salt only, or with the addition of a very little finely minced onion; then rubbed through a sieve, and heated, and served without any addition, or with only that of a teaspoonful of chili vinegar; or, when the colour is not a principal consideration, with a few spoonsful of rich cream, smoothly mixed with a little flour to prevent its curdling. The sauce must be stirred without ceasing should the last be added, and boiled for four or five minutes.

A FINER TOMATA SAUCE.

Stew very gently a dozen fine red tomatas, prepared as for the preceding receipt, with two or three sliced eschalots, four or five chilies or a capsicum or two (or in lieu of either, with a quarter of a teaspoonful of cayenne pepper), a few small dice of lean ham, and half a cupful of rich gravy. Stir these often, and when the tomatas are reduced quite to a smooth pulp, rub them through a sieve; put them into a clean saucepan, with a few spoonsful more of rich gravy, or _Espagnole_, add salt if needed, boil the sauce stirring it well for ten minutes, and serve it very hot. When the gravy is exceedingly good and highly flavoured, the ham may be omitted: a dozen small mushrooms nicely cleaned may also be sliced and stewed with the tomatas, instead of the eschalots, when their flavour is preferred, or they may be added with them. The exact proportion of liquid used is immaterial, for should the sauce be too thin it may be reduced by rapid boiling, and diluted with more gravy if too thick.

BOILED APPLE SAUCE.

Apples of a fine cooking sort require but a very small portion of liquid to boil down well and smoothly for sauce, if placed over a gentle fire in a close-shutting saucepan, and simmered as softly as possible until they are well broken; and their flavour is injured by the common mode of adding so much to them, that the greater part must be drained off again before they are sent to table. Pare the fruit quickly, quarter it, and be careful entirely to remove the cores; put one tablespoonful of water into a saucepan before the apples are thrown in, and proceed, as we have directed, to simmer them until they are nearly ready to serve: finish the sauce by the receipt which follows.

Apples, 1/2 lb.; water, 1 tablespoonful; stewed very softly: 30 to 60 minutes.

Obs.—These proportions are sufficient only for a small tureen of the sauce, and should be doubled for a large one.

For this, and all other preparations, apples will be whiter if just dipped into fresh water the instant before they are put into the stewpan. They should be quickly lifted from it, and will stew down easily to sauce with only the moisture which hangs about them. They should be watched and often gently stirred, that they may be equally done.

BAKED APPLE SAUCE.

(_Good._)

Put a tablespoonful of water into a quart basin, and fill it with good boiling apples, pared, quartered, and _carefully_ cored: put a plate over, and set them into a moderate oven for about an hour, or until they are reduced quite to a pulp; beat them smooth with a clean wooden spoon, adding to them a little sugar and a morsel of fresh butter, when these are liked, though they will scarcely be required.

The sauce made thus is far superior to that which is boiled. When no other oven is at hand, a Dutch or an American one would probably answer for it; but we cannot assert this on our own experience.

Good boiling apples, 1 quart: baked 1 hour (more or less according to the quality of the fruit, and temperature of the oven); sugar, 1 oz.; butter, 1/2 oz.

BROWN APPLE SAUCE.

Stew gently down to a thick and perfectly smooth marmalade, a pound of pearmains, or of any other well-flavoured boiling apples, in about the third of a pint of rich brown gravy: season the sauce rather highly with black pepper or cayenne, and serve it very hot. Curry sauce will make an excellent substitute for the gravy when a very piquant accompaniment is wanted for pork or other rich meat.

Apples pared and cored, 1 lb.; good brown gravy, third of pint 3/4 to 1-1/4 hour. Pepper or cayenne as needed.

WHITE ONION SAUCE.

Strip the skin from some large white onions, and after having taken off the tops and roots cut them in two, throw them into cold water as they are done, cover them plentifully with more water, and boil them very tender; lift them out, drain, and then press the water thoroughly from them; chop them small, rub them through a sieve or strainer, put them into a little rich melted butter mixed with a spoonful or two of cream or milk, and a seasoning of salt, give the sauce a boil, and serve it very hot. Portugal onions are superior to any others, both for this and for most other purposes of cookery.

For the finest kind of onion sauce, see _Soubise_, page 126, which follows.

BROWN ONION SAUCE.

Cut off both ends of the onions, and slice them into a saucepan in which two ounces of butter have been dissolved; keep them stewing gently over a clear fire until they are lightly coloured; then pour to them half a pint of brown gravy, and when they have boiled until they are perfectly tender, work the sauce altogether through a strainer, season it with a little cayenne, and serve it very hot.

ANOTHER BROWN ONION SAUCE.

Mince the onions, stew them in butter until they are well coloured, stir in a dessertspoonful of flour, shake the stewpan over the fire for three or four minutes, pour in only as much broth or gravy as will leave the sauce tolerably thick, season, and serve it.

SOUBISE.

(_English Receipt._)

Skin, slice, and mince quickly two pounds' weight of the white part only of some fine mild onions, and stew them in from two to three ounces of good butter over a very gentle fire until they are reduced to a pulp, then pour to them three-quarters of a pint of rich veal gravy; add a seasoning of salt and cayenne, if needed; skim off the fat entirely, press the sauce through a sieve, heat it in a clean stewpan, mix it with a quarter of a pint of rich boiling cream, and serve it directly.

Onions, 2 lbs.; butter, 2 to 3 oz.: 30 minutes to 1 hour. Veal gravy, 3/4 pint; salt, cayenne: 5 minutes. Cream, 1/4 pint.

SOUBISE.

(_French Receipt._)

Peel some fine white onions, and trim away all tough and discoloured parts; mince them small, and throw them into plenty of boiling water; when they have boiled quickly for five minutes drain them well in a sieve, then stew them very softly indeed in an ounce or

two of fresh butter until they are dry and perfectly tender; stir to them as much _béchamel_ as will bring them to the consistence of very thick pea-soup, pass the whole through a strainer, pressing the onion strongly that none may remain behind, and heat the sauce afresh, without allowing it to boil. A small half-teaspoonful of pounded sugar is sometimes added to this _soubise_.

White part of onions, 2 lbs.: blanched 5 minutes. Butter, 2 oz.: 30 to 50 minutes. Béchamel, 3/4 to 1 pint, or more.

Obs.—These sauces are served more frequently with lamb or mutton cutlets than with any other dishes; but they would probably find many approvers if sent to table with roast mutton, or boiled veal. Half the quantity given above will be sufficient for a moderate-sized dish.

MILD RAGOUT OF GARLIC, OR, L'AIL À LA BORDELAISE.

Divide some fine cloves of garlic, strip off the skin, and when all are ready throw them into plenty of boiling water slightly salted; in five minutes drain this from them, and pour in as much more, which should also be quite boiling; continue to change it every five or six minutes until the garlic is quite tender: throw in a moderate proportion of salt the last time to give it the proper flavour. Drain it thoroughly, and serve it in the dish with roast mutton, or put it into good brown gravy or white sauce for table. By changing very frequently the water in which it is boiled, the root will be deprived of its naturally pungent flavour and smell, and rendered extremely mild: when it is not wished to be quite so much so, change the water every ten minutes only.

Garlic, 1 pint: 15 to 25 minutes, or more. Water to be changed every 5 or 6 minutes; or every 10 minutes when not wished so _very_ mild. Gravy or sauce, 1 pint.

MILD ESCHALOT SAUCE.

Prepare and boil from half to a whole pint of eschalots by the preceding receipt; unless very large, they will be tender in about fifteen minutes, sometimes in less, in which case the water must be poured from them shortly after it has been changed for the second time. When grown in a suitable soil, and cultivated with care, the eschalots are sometimes treble the size that they are under other circumstances; and this difference must be allowed for in boiling them. Drain them _well_, and mix them with white sauce or gravy, or with good melted butter, and serve them very hot.

A FINE SAUCE, OR PURÉE OF VEGETABLE MARROW.

Pare one or two half-grown marrows and cut out all the seeds; take a pound of the vegetable, and slice it, with one ounce of mild onion, into a pint of strong veal broth or of pale gravy; stew them very softly for nearly or quite an hour; add salt and cayenne, or white pepper, when they are nearly done; press the whole through a fine and delicately clean hair-sieve; heat it afresh, and stir to it when it boils about the third of a pint of rich cream. Serve it with boiled chickens, stewed or boiled veal, lamb cutlets, or any other delicate meat. When to be served as a purée, an additional half-pound of the vegetable must be used; and it should be dished with small fried sippets round it. For a _maigre_ dish, stew the marrow and onion quite tender in butter, and dilute them with half boiling water and half cream.

Vegetable marrow, 1 lb.; mild onion, 1 oz.; strong broth or pale gravy, 1 pint: nearly or quite 1 hour. Pepper or cayenne, and salt as needed; good cream, from 1/4 to 3/4 of pint. For purée, 1/2 lb. more of marrow.

EXCELLENT TURNIP, OR ARTICHOKE SAUCE FOR BOILED MEAT.

Pare, slice, and boil quite tender, some finely-grained mild turnips, press the water from them thoroughly, and pass them through a sieve. Dissolve a slice of butter in a clean saucepan, and stir to it a large teaspoonful of flour, or mix them smoothly together before they are put in, and shake the saucepan round until they boil: pour to them very gradually nearly a pint of thin cream (or of good milk mixed with a portion of cream), add the turnips with a half-teaspoonful or more of salt, and when the whole is well mixed and very hot, pour it over boiled mutton, veal, lamb, or poultry. There should be sufficient of the sauce to cover the meat entirely;[58] and when properly made it improves greatly the appearance of a joint. A little cayenne tied in a muslin may be boiled in the milk before it is mixed with the turnips. Jerusalem artichokes make a more delicate sauce of this kind even than turnips; the weight of both vegetables must be taken after they are pared.

Footnote 58:

The objection to _masking_ a joint with this or any other sauce is, that it speedily becomes cold when spread over its surface: a portion of it at least should be served very hot in a tureen.

Pared turnips or artichokes, 1 lb.; fresh butter, 1-1/2 oz.; flour, 1 large teaspoonful (twice as much if all milk be used); salt, 1/2 teaspoonful or more; cream, or cream and milk mixed, from 3/4 to 1 pint.

OLIVE SAUCE.

Remove the stones from some fine French or Italian olives by paring the fruit close to them, round and round in the form of a corkscrew: they will then resume their original shape when done. Weigh six ounces thus prepared, throw them into boiling water, let them blanch for five minutes; then drain, and throw them into cold water, and leave them in it from half an hour to an hour, proportioning the time to their saltness; drain them well, and stew them gently from fifteen to twenty-five minutes in a pint of very rich brown gravy or _Espagnole_ (see Chapter IV.); add the juice of half a lemon, and serve the sauce very hot. Half this quantity will be sufficient for a small party.

Olives, stoned, 6 oz.; rich gravy, 1 pint: 15 to 25 minutes. Juice, 1/2 lemon.

Obs.—In France this sauce is served very commonly with ducks, and sometimes with beef-steaks, and with stewed fowl.

CELERY SAUCE.

Slice the white part of from three to five heads of young tender celery; peel it if not very young, and boil it in salt and water for twenty minutes. If for white sauce put the celery, after it has been well drained, into half a pint of veal broth or gravy, and let it stew until it is quite soft; then add an ounce and a half of butter, mixed with a dessertspoonful of flour, and a quarter of a pint of thick cream or the yolks of three eggs. The French, after boiling the celery, which they cut very small, for about twenty minutes, drain and _chop_ it; then put it with a slice of butter into a stewpan, and season it with pepper, salt, and nutmeg; they keep these stirred over the fire for two or three minutes, and then dredge in a dessertspoonful of flour: when this has lost its raw taste, they pour in a sufficient quantity of white gravy to moisten the celery, and to allow for twenty minutes' longer boiling. A very good common celery sauce is made by simply stewing the celery cut into inch-lengths in butter, until it begins to be tender; and then adding a spoonful of flour, which must be allowed to brown a little, and half a pint of _good_ broth or beef gravy, with a seasoning of pepper or cayenne.

Celery, 3 to 5 heads: 20 minutes. Veal broth, or gravy, 1/2 pint; 20 to 40 minutes. Butter, 1-1/2 oz.; flour, 1 dessertspoonful; cream, 1/4 pint, or three yolks of eggs.

WHITE CHESTNUT SAUCE.

Strip the outer rind from six ounces of sound sweet chestnuts, then throw them into boiling water, and let them simmer for two or three minutes, when the second skin will easily peel off. Add to them three quarters of a pint of good cold veal gravy, and a few strips of lemon rind, and let them stew gently for an hour and a quarter. Press them, with the gravy, through a hair-sieve reversed and placed over a deep dish or pan, as they are much more easily rubbed through thus than in the usual way: a wooden spoon should be used in preference to any other for the process. Add a little cayenne and mace, some salt if needed, and about six tablespoonsful of rich cream. Keep the sauce stirred until it boils, and serve it immediately.

Chestnuts without their rinds, 6 oz.; veal gravy, 1 pint; rind of 1/2 lemon: 1-1/4 hour. Salt; spice; cream, 6 tablespoonsful.

Obs.—This sauce may be served with turkey, with fowls, or with stewed veal cutlets.

BROWN CHESTNUT SAUCE.

Substitute rich brown gravy for the veal stock, omit the lemon-rind and cream, heighten the seasonings, and mix the chestnuts with a few spoonsful of _Espagnole_ or highly flavoured gravy, after they have been passed through the sieve.

PARSLEY-GREEN, FOR COLOURING SAUCES.

Gather a quantity of young parsley, strip it from the stalks, wash it very clean, shake it as dry as possible in a cloth, pound it in a mortar, press all the juice closely from it through a hair-sieve reversed, and put it into a clean jar; set it into a pan of boiling water, and in about three minutes, if _gently_ simmered, the juice will be poached sufficiently; lay it then upon a clean sieve to drain, and it

will be ready for use.

Spinach-green, for which particular directions will be found at the commencement of Chapter XXIV., is prepared in the same manner. The juice of various herbs pounded together may be pressed from them through a sieve and added to cold sauces.

TO CRISP PARSLEY.

Wash some branches of young parsley well, drain them from the water, and swing them in a clean cloth until they are quite dry; place them on a sheet of writing paper in a Dutch oven, before a brisk fire, and keep them frequently turned until they are quite crisp. They will become so in from six to eight minutes.

FRIED PARSLEY.

When the parsley has been prepared as for crisping, and is _quite_ dry, throw it into plenty of lard or butter, which is on the point of boiling; take it up with a skimmer the instant it is crisp, and drain it on a cloth spread upon a sieve reversed, and placed before the fire.

MILD MUSTARD.

Mustard for instant use should be mixed with milk, to which a spoonful or two of very thin cream may be added.

MUSTARD THE COMMON WAY.

The great art of mixing mustard is to have it perfectly smooth, and of a proper consistency. The liquid with which it is moistened should be added to it in small quantities, and the mustard should be well rubbed, and beaten with a spoon. Mix half a teaspoonful of salt with two ounces of the flour of mustard, and stir to them by degrees sufficient boiling water to reduce it to the appearance of a thick batter: do not put it into the mustard-glass until it is cold. Some persons like a half-teaspoonful of sugar in the finest powder mixed with it. It ought to be sufficiently diluted always to drop easily from the spoon; and to bring it to this state more than a quarter of a pint, and less than _half_ a pint of liquid will be needed for four ounces of the best Durham mustard.

For Tartar mustard see Chapter VII.

FRENCH BATTER.

(_For frying vegetables, and for apple, peach, or orange fritters._)

Cut a couple of ounces of good butter into small bits, pour on it less than a quarter of a pint of boiling water, and when it is dissolved add three quarters of a pint of cold water, so that the whole shall not be quite milk warm; mix it then by degrees and very smoothly with twelve ounces of fine dry flour and a _small_ pinch of salt if the batter be for fruit fritters, but with more if for meat or vegetables. Just before it is used, stir into it the whites of two eggs beaten to a solid froth; but previously to this, add a little water should it appear too thick, as some flour requires more liquid than other to bring it to the proper consistence; this is an exceedingly light crisp batter, excellent for the purposes for which it is named.

Butter, 2 oz.; water, from 3/4 to nearly 1 pint; little salt; flour, 3/4 lb.; whites of 2 eggs, beaten to snow.

TO PREPARE BREAD FOR FRYING FISH.

Cut thick slices from the middle of a loaf of light stale bread, pare the crust entirely from them, and dry them gradually in a cool oven until they are crisp quite through; let them become cold, then roll or beat them into fine crumbs, and keep them in a dry place for use. To strew over hams or cheeks of bacon, the bread should be left all night in the oven, which should be sufficiently heated to brown, as well as to harden it: it ought indeed to be entirely converted into equally-coloured crust. It may be sifted through a dredging-box on to the hams after it has been reduced almost to powder.

BROWNED FLOUR FOR THICKENING SOUPS AND GRAVIES.

Spread it on a tin or dish and colour it, without burning, in a gentle oven or before the fire in a Dutch or American oven: turn it often, or the edges will be too much browned before the middle is enough so. This, blended with butter, makes a convenient thickening for soups or gravies of which it is desirable to deepen the colour; and it requires less time and attention than the French _roux_ of

FRIED BREAD-CRUMBS.

Grate lightly into very fine crumbs four ounces of stale bread, and _shake_ them through a cullender;[59] without rubbing or touching them with the hands. Dissolve two ounces of fresh butter in a frying-pan, throw in the crumbs, and stir them constantly over a moderate fire, until they are all of a clear golden colour; lift them out with a skimmer, spread them on a soft cloth, or upon white blotting paper, laid upon a sieve reversed, and dry them before the fire. They may be more delicately prepared by browning them in a gentle oven without the addition of butter.

Footnote 59:

This is not necessary when they are lightly and finely grated of uniform size.

Bread, 4 oz.; butter, 2 oz.

FRIED BREAD FOR GARNISHING.

Cut the crumb of a stale loaf in slices a quarter of an inch thick; form them into diamonds or half diamonds, or shape them with a paste-cutter in any another way; fry them in fresh butter, some of a very pale brown and others a deeper colour; dry them well, and place them alternately round the dish that is to be garnished. They may be made to adhere to the edge of the dish when they are required for _ornament_ only, by means of a little flour and white of egg brushed over the side which is placed on it: this must be allowed to dry before they are served.

For SWEET-PUDDING SAUCES, see Chapter XX.

CHAPTER VI.

=Cold Sauces, Salads, etc.=

SUPERIOR MINT-SAUCE.

(_To serve with lamb._)

THE mint for this sauce should be fresh and young, for when old it is tough and indigestible. Strip the leaves from the stems, wash them with great nicety, and drain them on a sieve, or dry them in a cloth; chop them very fine, put them into a sauce-tureen, and to three heaped tablespoonsful of the mint add two of pounded sugar; let them remain a short time well mixed together, then pour to them gradually six tablespoonsful of good vinegar. The sauce thus made is excellent, and far more wholesome than when a larger proportion of vinegar and a smaller one of sugar is used for it; but, after the first trial, the proportions can easily be adapted to the taste of the eaters.

COMMON MINT-SAUCE.

Two tablespoonsful of mint, one _large_ tablespoonful of pale brown sugar, well mixed together, and a quarter of a pint of vinegar, stirred until the sugar is entirely dissolved.

STRAINED MINT SAUCE.

Persons with whom the mint in substance disagrees can have the flavour of the herb without it, by mixing the ingredients of either of the preceding receipts, and straining the sauce after it has stood for two or three hours; the mint should be well pressed when this is done. The flavour will be the more readily extracted if the mint and sugar are well mixed, and left for a time before the vinegar is added.

FINE HORSERADISH SAUCE.

(_To serve with cold, roast, stewed, or boiled beef._)

The root for this excellent sauce should be young and tender, and grated down on a very fine bright grater, quite to a pulp, after it has been washed, wiped, and scraped free from the outer skin. We have given the proportions for it in the preceding chapter, but repeat them here.

Horseradish, 2 heaped tablespoonsful; salt, 1 moderate teaspoonful; rich cream, 4 tablespoonsful; good vinegar, 3 dessertspoonsful (of which one may be chili vinegar when the root is mild.) When the other ingredients are smoothly mingled, the vinegar must be stirred briskly to them in very small portions. A few drops of garlic or shalot vinegar can be added to them when it is liked.

COLD MAÎTRE D'HÔTEL, OR STEWARD'S SAUCE.

Work well together until they are perfectly blended, two or three ounces of good butter, some pepper, salt, minced parsley, and the strained juice of a sound lemon of moderate size. The sauce thus prepared is often put into broiled fish; and laid in the dish _under_ broiled kidneys, beef-steaks, and other meat.

For 2 oz. butter, 1 _heaped_ teaspoonful young minced parsley; juice of 1 lemon; 1 small saltspoonful salt; seasoning of white pepper.

Obs.—The proportion of parsley may be doubled when a larger quantity is liked: a little fine cayenne would often be preferred to the pepper.

COLD DUTCH OR AMERICAN SAUCE, FOR SALADS OF DRESSED VEGETABLES, SALT FISH, OR HARD EGGS.

Put into a saucepan three ounces of good butter very smoothly blended with a quite small teaspoonful of flour, and add to them a large wineglassful of cold water, half as much sharp vinegar (or very fresh, strained, lemon-juice) a saltspoonful of salt, and half as much cayenne in fine powder. Keep these shaken briskly round, or stirred over a clear fire, until they form a smooth sauce and boil rapidly; then stir them very quickly to the beaten yolks of four fresh eggs, which will immediately give the sauce the consistence of custard; pour it hot over the salad, and place it on ice, or in a very cool larder until it is quite cold: if properly made, it will be very thick and smooth, and slightly _set_, as if it contained a small portion of isinglass. A dessertspoonful of parsley,—or of tarragon,—can be mingled with it at _pleasure_, or any flavour given to it with store-sauces which is liked. It converts flakes of salt-fish, sliced potatoes (new or old), and hard eggs, into excellent salads.

ENGLISH SAUCE FOR SALAD, COLD MEAT, OR COLD FISH.

The first essential for a smooth, well-made English salad dressing is to have the yolks of the eggs used for it sufficiently hard to be reduced easily to a perfect paste. They should be boiled at least fifteen minutes, and should have become _quite_ cold before they are taken from the shells; they should also be well covered with water when they are cooked, or some parts of them will be tough, and will spoil the appearance of the sauce by rendering it lumpy, unless they be worked through a sieve, a process which is always better avoided if possible. To a couple of yolks broken up and mashed to a paste with the back of a wooden spoon, add a small saltspoonful of salt, a large one of pounded sugar, a few grains of fine cayenne, and a teaspoonful of cold water; mix these well, and stir to them by degrees a quarter of a pint of sweet cream; throw in next, stirring the sauce briskly, a tablespoonful of strong chili vinegar, and add as much common or French vinegar as will acidulate the mixture agreeably. A tablespoonful of either will be sufficient for many tastes, but it is easy to increase the proportion when more is liked. Six tablespoonsful of olive oil, of the purest quality, may be substituted for the cream: it should be added in very small portions to the other ingredients, and stirred briskly as each is added until the sauce resembles custard. When this is used, the water should be omitted. The piquancy of this preparation—which is very delicate, made by the directions just given—may be heightened by the addition of a little eschalot vinegar, Harvey's sauce, essence of anchovies, French mustard, or tarragon vinegar; or by bruising with the eggs a morsel of garlic, half the size of a hazel-nut: it should always, however, be rendered as appropriate as may be to the dish with which it is to be served.

Obs. 1.—As we have before had occasion to remark, garlic, when very sparingly and judiciously used, imparts a remarkably fine savour to a sauce or gravy, and neither a strong nor a coarse one, as it does when used in larger quantities. The veriest morsel (or, as the French call it, a mere _soupçon_) of the root, is sufficient to give this agreeable piquancy, but unless the proportion be extremely small, the effect will be quite different. The Italians dress their salads upon a round of delicately toasted bread, which is rubbed with garlic, saturated with oil, and sprinkled with cayenne, before it is laid into the bowl: they also eat the bread thus

prepared, but with less of oil, and untoasted often, before their meals, as a digester.

Obs. 2.—French vinegar is so infinitely superior to English in strength, purity, and flavour, that we cannot forbear to recommend it in preference for the use of the table. We have for a long time past been supplied with some of most excellent quality (labelled _Vinaigre de Bordeaux_) imported by the Messrs. Kent & Sons, of Upton-on-Severn, who supply it largely, we believe, both to wholesale and retail venders in town and country.

THE POET'S RECEIPT FOR SALAD.[60]

Footnote 60:

Note.—This receipt, though long privately circulated amongst the friends and acquaintance of its distinguished and regretted author, now (with permission) appears for the first time in print. We could not venture to deviate by a word from the original, but we would suggest, that the mixture forms almost a substitute for salad, instead of a mere dressing. It is, however, an admirable compound for those to whom the slight flavouring of onion is not an objection.

"Two large potatoes, passed through kitchen sieve Unwonted softness to the salad give; Of mordent mustard, add a single spoon, Distrust the condiment which bites so soon; But deem it not, thou man of herbs, a fault, To add a double quantity of salt; Three times the spoon with oil of Lucca crown, And once with vinegar, procured from town; True flavour needs it, and your poet begs The pounded yellow of two well-boiled eggs; Let onion atoms lurk within the bowl, And, scarce suspected, animate the whole; And lastly, in the flavoured compound toss A magic teaspoon of anchovy sauce: Then, though green turtle fail, though venison's tough, And ham and turkey are not boiled enough, Serenely full, the epicure may say— Fate cannot harm me,—I have dined to-day."

Two well-boiled potatoes, passed through a sieve; a teaspoonful of mustard; two teaspoonsful of salt; one of essence of anchovy; about a quarter of a teaspoonful of very finely-chopped onions, well bruised into the mixture; three tablespoonsful of oil; one of vinegar; the yolks of two eggs, hard boiled. Stir up the salad immediately before dinner, and stir it up thoroughly.

N.B.—As this salad is the result of great experience and reflection, it is hoped young salad makers will not attempt to make any improvements upon it.

SAUCE MAYONNAISE.

(_For salads, cold meat, poultry, fish, or vegetables._)

This is a very fine sauce when all the ingredients used for it are good; but it will prove an uneatable compound to a delicate taste unless it be made with oil of the purest quality.

Put into a large basin the yolks only of two very fresh eggs, carefully freed from specks, with a little salt and cayenne; stir these well together, then add about a teaspoonful of the purest salad oil, and work the mixture round with a wooden spoon until it appears like cream. Pour in by slow degrees nearly half a pint of oil, continuing at each interval to work the sauce as at first until it resumes the smoothness of cream, and not a particle of the oil remains visible; then add a couple of tablespoonsful of plain French or of tarragon vinegar, and one of cold water to whiten the sauce. A bit of clear veal jelly the size of an egg will improve it greatly. The reader who may have a prejudice against the unboiled eggs which enter into the composition of the Mayonnaise, will find that the most fastidious taste would not detect their being raw, if the sauce be well made; and persons who dislike oil may partake of it in this form, without being aware of its presence, provided always that it be perfectly fresh, and pure in flavour, for otherwise it will be easily perceptible.

Yolks of fresh unboiled eggs, 2; salt, 1/2 saltspoonful, or rather more; cayenne; oil, full third of pint; French or tarragon vinegar, 2 tablespoonsful; cold water, 1 tablespoonful; meat jelly (if at hand), size of an egg.

RED OR GREEN MAYONNAISE SAUCE.

Colour may be given either to the preceding or to the following _Sauce Mayonnaise_ by mingling with it some hard lobster-coral reduced to powder by rubbing it through a very fine hair-sieve: the red hue of this is one of the most brilliant and beautiful that can be seen, but the sauce for which it is used can only be appropriately served with fish or fish-salads. Spinach-green will impart a fine tint to any preparation, but its flavour is objectionable: that of parsley-green is more agreeable. Directions for both of these are contained in the previous chapter.

IMPERIAL MAYONNAISE.

(_An elegant jellied sauce, or salad-dressing._)

Put into a bowl half a pint of aspic, or of any very clear pale jellied stock (that made usually for good white soup will serve for the purpose excellently); add to it a couple of spoonsful of the purest olive-oil, one of sharp vinegar, and a little fine salt and cayenne. Break up the jelly quite small with the points of a whisk of osier-twigs, stir the ingredients well together, and then whisk them gently until they are converted into a smooth white sauce. This receipt was derived originally from an admirable French cook,[61] who stood _quite_ at the head of his profession; but as he was accustomed to purvey for the tables of kings and emperors, his directions require some curtailment and simplifying to adapt them to the resources of common English life. He directs the preparation to be mixed and worked—to use a technical expression—over _ice_, which cannot always be commanded, except in opulent establishments, and in large towns. It is not, however, essential to the success of this sauce, which will prove extremely good if made and kept in a cool larder; or, if the bowl in which it is mingled be placed in a pan of cold water, into which plenty of saltpetre and sal-ammoniac, roughly powdered, are thrown at the moment it is set into it. In this country a smaller proportion of oil, and a larger one of acid, are usually preferred to the common French salad-dressings, in which there is generally a very small portion of vinegar. To some tastes a spoonful or two of cream would improve the present Mayonnaise, which may be varied also with chili, tarragon, or other flavoured vinegar. It should be served heaped high in the centre of the salad, for which, if large, double the quantity directed _here_ should be prepared.

Footnote 61:

Monsieur Carême, to whose somewhat elaborate but admirable works, published thirty years or more since, all modern cooks appear to be specially indebted.

REMOULADE.

This differs little from an ordinary English salad-dressing. Pound very smoothly indeed the yolks of two or three hard-boiled eggs with a teaspoonful of mustard, half as much salt, and some cayenne, or white pepper. Mix gradually with them, working the whole well together, two or three tablespoonsful of oil and two of vinegar. Should the sauce be curdled, pour it by degrees to the yolk of a raw egg, stirring it well round as directed for the Mayonnaise. A spoonful of tarragon, cucumber, or eschalot-vinegar, may be added with very good effect; and to give it increased relish, a teaspoonful of cavice, or a little of Harvey’s sauce, and a dessertspoonful of chili vinegar may be thrown into it. This last is an excellent addition to all cold sauces, or salad-dressings.

Hard yolks of 2 or of 3 eggs; mustard, 1 teaspoonful (more when liked); salt, 1/2 teaspoonful; pepper or cayenne; oil, 3 tablespoonsful; vinegar, 2. If curdled, yolk of 1 raw egg. Good additions: tarragon or eschalot, or cucumber-vinegar, 1 tablespoonful; chili vinegar, 1 dessertspoonful; cavice or Harvey’s sauce at pleasure.

Obs.—A dessertspoonful of eschalots, or a _morsel_ of garlic, very finely minced, are sometimes pounded with the yolks of eggs for this sauce.

OXFORD BRAWN SAUCE.

Mingle thoroughly a tablespoonful of brown sugar with a teaspoonful of made mustard, a third as much of salt, some pepper, from three to four tablespoonsful of very fine salad-oil, and two of strong vinegar; or apportion the same ingredients otherwise to the taste.

FORCED EGGS FOR GARNISHING SALAD.

Pound and press through the back of a hair-sieve the flesh of three very fine, or of four moderate-sized anchovies, freed from the bones and skin. Boil six fresh eggs for twelve minutes, and when they are perfectly cold, halve them lengthwise, take out the yolks, pound them to a paste with a third of their volume of fresh butter, then add the anchovies, a quarter of a teaspoonful of mace, and as much cayenne as will season the mixture well; beat these together thoroughly, and fill the whites of egg neatly with them. A _morsel_ of garlic, perfectly blended with the other ingredients, would to some tastes improve this preparation: a portion of anchovy-butter, or of potted ham, will supply the place of fish in it very advantageously.

Eggs, 6; anchovies, 4; butter, size of 2 yolks; mace, 1/4 teaspoonful; cayenne, third as much.

ANCHOVY BUTTER.

(_Excellent._)

Scrape the skin quite clear from a dozen fine mellow anchovies, free the flesh entirely from the bones, and pound it as smooth as possible in a mortar; rub it through the back of a hair-sieve with a wooden spoon; wipe out the mortar, and put back the anchovies with three quarters of a pound of very fresh butter, a small half-saltspoonful of cayenne, and more than twice as much of finely grated nutmeg, and freshly pounded mace; and beat them together until they are thoroughly blended. If to serve cold at table, mould the butter in small shapes, and turn it out. A little rose pink (which is sold at the chemists') is sometimes used to give it a fine colour, but it must be sparingly used, or it will impart an unpleasant flavour, and we cannot much recommend its use: it should be well pounded, and very equally mixed with it. For kitchen use, press the butter down into jars or pattypans, and keep it in a cool place.

Fine anchovies, 12; butter, 3/4 lb.; cayenne, small 1/2 saltspoonful; nutmeg and mace, each more than twice as much; rose pink (if used), 1/2 teaspoonful.

This proportion differs from potted anchovies only in the larger proportion of butter mixed with the fish, and the milder seasoning of spice. It will assist to form an elegant dish if made into pats, and stamped with a tasteful impression, then placed alternately with pats of lobster-butter, and decorated with light foliage. It is generally eaten with much relish when carefully compounded, and makes excellent sandwiches. To convert it into a good fish sauce, mix two or three ounces of it with a teaspoonful of flour and a few spoonsful of cold water, or of pale veal stock, and keep them constantly stirred until they boil. The butter should not be moulded directly it is taken from the mortar, as it is then very soft from the beating. It should be placed until it is firm in a very cool place or over _ice_, when it can be done conveniently.

LOBSTER BUTTER.

Pound to the smoothest possible paste the coral of one or two fresh hen lobsters, mix with it about an equal proportion of fresh firm butter, and a moderate seasoning of mace and cayenne, with a little salt if needed. Let the whole be thoroughly blended, and set it aside in a cool larder, or place it over ice until it is sufficiently firm to be made into pats. Serve it garnished with curled parsley, or with any light foliage which will contrast well with its brilliant colour. The coral may be rubbed through a fine sieve before it is put into the mortar, and will then require but little pounding.

An excellent preparation is produced by mingling equal proportions of lobster and of anchovy butter in the mortar, or one-third of the anchovy with two of lobster: to this some of the white flesh of the latter can be added to give another variety, after it has been prepared by the receipt for _boudirettes_, Chapter III.

TRUFFLED BUTTER (AND TRUFFLES POTTED IN BUTTER.)

(_For the breakfast or luncheon table._)

Cut up a pound of sweet fresh butter, and dissolve it gently over a clear fire; take off the scum which will gather thickly upon it, and when it has simmered for three or four minutes, draw it from the fire, and let it stand until all the buttermilk has subsided; pour it softly from this upon six ounces of ready-pared sound French truffles, cut into small, but rather thick, slices, and laid into a delicately clean enamelled saucepan; add a full seasoning of freshly pounded mace and fine cayenne, a small saltspoonful of salt, and half a not large nutmeg. When the butter has become quite cold, proceed to heat the truffles slowly, shaking the saucepan often briskly round, and stew them as gently as possible for twenty minutes, or longer should they not then be very tender. If allowed to heat, and to boil quickly, they will become _hard_, and the preparation, as regards the _truffles_, will be a comparative failure. Lift them with a spoon into quite dry earthen or china pans, and pour the butter on them; or add to them sufficient of it only to cover them well and to exclude the air, and pot the remainder of the butter apart: it will be finely flavoured, and may be eaten by delicate persons to whom the truffle itself would be injurious. It may also be used in compounding savoury sauces, and for moistening small _croustades_ before they are fried or baked. The truffles themselves will remain good for months when thus prepared, if kept free from damp; and in flavour they will be found excellent. The parings taken from them will also impart a very agreeable savour to the butter, and will serve extremely well for it for immediate use. They will also be valuable as additions to gravies or to soups.

We should observe, that the juice which will have exuded from the truffles in the stewing will cause the preparation to become mouldy, or otherwise injure it, if it be put into the pans either with them or with the butter. The truffles must be well drained from it when they are taken from the saucepan, and the butter must remain undisturbed for a few minutes, when it can be poured clear from the juice, which will have subsided to the bottom of the pan. We have given here the result of our first experiment, which we found on further trial to answer perfectly.

ENGLISH SALADS.

The herbs and vegetables for a salad cannot be too freshly gathered; they should be carefully cleared from insects and washed with scrupulous nicety; they are better when not prepared until near the time of sending them to table, and should not be sauced until the instant before they are served. Tender lettuces, of which the stems should be cut off, and the outer leaves be stripped away, mustard and cress, young radishes, and occasionally chives or small green onions (when the taste of a party is in favour of these last) are the usual ingredients of summer salads. (In early spring, as we have stated in another chapter, the young white leaves of the dandelion will supply a very wholesome and excellent salad, of which the slight bitterness is to many persons as agreeable as that of the endive.) Half-grown cucumbers sliced thin, and mixed with them, are a favourite addition with many persons. In England it is customary to cut the lettuces extremely fine; the French, who object to the _flavour of the knife_, which they fancy this mode imparts, break them small instead. Young celery alone, sliced and dressed with a rich salad mixture, is excellent: it is still in some families served thus always with roast pheasants.

Beet-root, baked or boiled, blanched endive, small salad-herbs which are easily raised at any time of the year, celery, and hardy lettuces, with any ready-dressed vegetable, will supply salads through the winter. Cucumber vinegar is an agreeable addition to these.

FRENCH SALAD.

In winter this is made principally of beautifully-blanched endive, washed delicately clean and broken into small branches with the fingers, then taken from the water and shaken dry in a basket of peculiar form, appropriated to the purpose,[62] or in a fine cloth; then arranged in the salad bowl, and strewed with herbs (tarragon generally, when in season) minced small: the dressing is not added until just before the salad is eaten. In summer, young lettuces are substituted for the endive, and intermixed with a variety of herbs, some of which are not generally cultivated in England.

Footnote 62:

Salad-baskets are also to be found in many good English kitchens, but they are not in such general use here as on the continent.

FRENCH SALAD DRESSING.

Stir a saltspoonful of salt and half as much pepper into a large spoonful of oil, and when the salt is dissolved, mix with them four additional spoonsful of oil, and pour the whole over the salad; let it be _well_ turned, and then add a couple of spoonsful of tarragon vinegar; mix the whole thoroughly, and serve it without delay. The salad should not be dressed in this way until the instant before it is wanted for table: the proportions of salt and pepper can be increased at pleasure, and common or cucumber vinegar may be substituted for the tarragon, which, however, is more frequently used in France than any other.

Salt, 1 spoonful: pepper, 1/2 as much; oil, 5 saladspoonsful; tarragon, or other vinegar, 2 spoonsful.

DES CERNEAUX, OR WALNUT SALAD.

This is a common summer salad in France, where the growth of walnuts is generally abundant, but is not much served in England; though the sweet flavour of the just-formed nut is very agreeable. Take the walnuts when a pin will pierce them _easily_, pare them down to the kernels, and toss them gently, just before they are served, in a French or English salad-dressing (the former would generally be preferred we think), and turn them into the salad-bowl for table.

SUFFOLK SALAD.

Fill a salad-bowl from half to three parts full with very tender lettuces shred small, minced lean of ham, and hard-boiled eggs, or their yolks only also minced, placed in alternate layers; dress the mixture with English salad sauce, but do not pour it into the bowl until the instant of serving. A portion of cold chicken (or veal), cut in thin slices about the size of a shilling, may be added when

convenient; the ham and eggs also may be sliced instead of being minced, and the whole neatly arranged in a chain or otherwise round the inside of the bowl.

YORKSHIRE PLOUGHMAN'S SALAD.

Mix treacle and vinegar, in the proportion of one tablespoonful of the first to two of the latter; add a little black pepper, and eat the sauce with lettuces shred small (with an intermixture of young onions when they are liked).

AN EXCELLENT SALAD OF YOUNG VEGETABLES.

Pare off the coarse, fibrous parts from four or five artichoke bottoms, boiled quite tender, well drained, and freed carefully from the insides; cut them into quarters, and lay them into the salad-bowl; arrange over them some cold new potatoes and young carrots sliced moderately thin, strew minced tarragon, chervil, or any other herbs which may be better liked, thickly over the surface, and sauce the salad with an English or French dressing just before it is sent to table. Very young French beans cut into short lozenge-shaped lengths, or asparagus points, can be added to this dish at pleasure; or small tufts of cauliflower may be placed round it. When these additions are made, the herbs are better omitted: a little of the liquor of pickled Indian mangoes may be advantageously mixed with the sauce for this salad, or in lieu of it some chili vinegar or cayenne pepper. The Dutch or American sauce of the previous pages would also make an appropriate dressing for it.

SORREL SALAD.

(_To serve with Lamb-cutlets, Veal cutlets, or Roast Lamb_.)

This, though a very agreeable and refreshing salad, is not to be recommended when there is the slightest tendency to disorder of the system; for the powerful acid of the uncooked sorrel might in that case produce serious consequences.[63]

Footnote 63:

It should be especially avoided when dysentery, or other diseases of a similar nature, are prevalent. We mention this, because if more general precaution were observed with regard to diet, great suffering would, in many instances, be avoided.

Take from the stems some very young tender sorrel, wash it delicately clean, drain it well, and shake it dry in a salad-basket, or in a soft cloth held by the four corners; arrange it lightly in the bowl, and at the instant of serving, sauce it simply with the preceding French dressing of oil with a small portion of vinegar, or with a _Mayonnaise_ mixed with _chili_ instead of a milder vinegar. The sorrel may be divided with the fingers and mingled with an equal proportion of very tender lettuces; and, when it is not objected to,[64] mixed tarragon may be strewed thickly upon them. To some tastes a _small_ quantity of green onions or of eschalots would be more agreeable.

Footnote 64:

The peculiar flavour of this fine aromatic herb is less generally relished in England than in many other countries; but when it is not disliked it may be used with great advantage in our cookery: it is easily cultivated, and quite deserves a nook in every kitchen-garden.

LOBSTER SALAD.

First, prepare a sauce with the coral of a hen lobster, pounded and rubbed through a sieve, and very gradually mixed with a good _mayonnaise_, _remoulade_, or English salad-dressing of the present chapter. Next, half fill the bowl or more with small salad herbs, or with young lettuces finely shred, and arrange upon them spirally, or in a chain, alternate slices of the flesh of a large lobster, or of two middling-sized ones, and some hard-boiled eggs cut thin and evenly. Leave a space in the centre, pour in the sauce, heap lightly some small salad on the top, and send the dish immediately to table. The coral of a second lobster may be intermingled with the white flesh of the fish with very good effect; and the forced eggs of page 137 may be placed at intervals round the edge of the bowl as a decoration, and an excellent accompaniment as well. Another mode of making the salad is to lay the split bodies of the fish round the bowl, and the claws, freed carefully from the shells, arranged high in the centre on the herbs; the soft part of the bodies may be mixed with the sauce when it is liked; but the colour will not then be good.

Obs.—The addition of cucumber in ribbons (see Author's Receipt, Chapter XVII.), laid lightly round it, is always an agreeable one to lobster salad: they may previously be sauced, and then drained from their dressing a little.

A more wholesome and safer mode of imparting the flavour of the cucumber, however, is to use for the salad vinegar in which that vegetable has been steeped for some hours after having been cut up small.

AN EXCELLENT HERRING SALAD.

(_Swedish Receipt._)

Soak, skin, split, and bone a large Norway herring; lay the two sides along a dish, and slice them slopingly (or substitute for this one or two fine Dutch herrings). Arrange in symmetrical order over the fish slices of cooked beet-root, cold boiled potatoes, and pickled gherkins; then add one or two sharp apples chopped small, and the yolks and whites, separately minced, of some hard-boiled eggs, with any thing else which may be at hand, and may serve to vary tastefully the decoration of the dish. Place these ingredients in small heaps of well-contrasting colours on the surface of the salad, and lay a border of curled celery leaves or parsley round the bowl. For sauce, rub the yolk of one hard-boiled egg quite smooth with some salt; to this add oil and vinegar as for an ordinary salad, and dilute the whole with some thick sour cream.

Obs.—"Sour cream" is an ingredient not much approved by English taste, but it enters largely into German cookery, and into that of Sweden, and of other northern countries also. About half a pound of cold beef cut into small thin shavings or collops, is often added to a herring-salad abroad: it may be either of simply roasted or boiled, or of salted and smoked meat.

TARTAR SAUCE.

(_Sauce à la Tartare_).

Add to the preceding _remoulade_, or to any other sauce of the same nature, a teaspoonful or more of made mustard, one of finely-minced shalots, one of parsley or tarragon, and one of capers or of pickled gherkins, with a rather high seasoning of cayenne, and some salt if needed. The tartar-mustard of the previous chapter, or good French mustard, is to be preferred to English for this sauce, which is usually made very pungent, and for which any ingredients can be used to the taste which will serve to render it so. Tarragon vinegar, _minced tarragon_ and eschalots, and plenty of oil, are used for it in France, in conjunction with the yolks of one or two eggs, and chopped capers, or gherkins, to which olives are sometimes added.

SHRIMP CHATNEY.

(_Mauritian Receipt._)

Shell with care a quart of fresh shrimps (for the mode of doing this see Chapter III.), mince them quickly upon a dish with a large sharp knife, then turn them into a mortar and pound them to a perfectly smooth paste. Next, mix with them very gradually two or three spoonsful of salad oil of the best quality, some young green chilies chopped small (or when these cannot be procured, some _good_ cayenne pepper as a substitute), some young onions finely minced, a little salt if required, and as much vinegar or strained lemon juice as will render the sauce pleasantly acid. Half a saltspoonful or more of powdered ginger is sometimes used in addition to the above ingredients.

When they are preferred, two or three small shalots minced and well bruised with the shrimps may be substituted for the onions.[65] The proportion of oil should be double that of the vinegar used; but in this preparation, as in all others of the same nature, individual taste must regulate the proportion of the most powerful condiments which enter into its composition. All chatneys should be _quite thick_, almost of the consistence of mashed turnips, or stewed tomatas, or stiff bread sauce. They are served with curries; and also with steaks, cutlets, cold meat, and fish. In the East the native cooks crush to a pulp upon a stone slab, and with a stone roller, the ingredients which we direct to be pounded. On occasion the fish might be merely minced. When beaten to a paste, they should be well separated with a fork as the chilies, &c., are added.

Footnote 65:

The sauce can be made without either when their flavour is not liked.

CAPSICUMB CHATNEY.

Slice transversely and very thin, into a bowl or pan of spring water, some large tender green capsicumbs, and let them steep for an hour or two; then drain, and dress with oil, vinegar, and salt.

For TOMATA and SAUSAGE CHATNEY, see CHAPTER OF FOREIGN COOKERY.

CHAPTER VII.

=Store Sauces.=

[Illustration:

Mushrooms, Eschalots, and Tomatas.]

OBSERVATIONS.

A WELL selected stock of these will always prove a convenient resource in simple cookery for giving colour and flavour to soups, gravies, and made dishes; but unless the consumption be considerable, they should not be over-abundantly provided, as few of them are improved by age, and many are altogether spoiled by long keeping, especially if they be not perfectly secured from the air by sound corking, or if stored where there is the slightest degree of damp. To prevent loss, they should be examined at short intervals, and at the first appearance of mould or fermentation, such as will bear the process should be reboiled, and put, when again quite cold, into clean bottles; a precaution often especially needful for mushroom catsup when it has been made in a wet season, or when it has not been very carefully prepared. This, with essence of anchovies, walnut catsup, Harvey's sauce, cavice, lemon-pickle, chili, cucumber, and eschalot vinegar, will be all that is commonly needed for family use; but there is at the present day an extensive choice of these stores on sale, some of which are excellent.

CHETNEY SAUCE.

(_Bengal Receipt_).

[Illustration:

Garlic.]

Stone four ounces of good raisins, and chop them small, with half a pound of crabs, sour apples, unripe bullaces,[66] or of any other hard acid fruit. Take four ounces of coarse brown sugar, two of powdered ginger, and the same quantity of salt and cayenne pepper; grind these ingredients separately in a mortar, as fine as possible; then pound the fruits well, and mix the spices with them, one by one; beat them together until they are perfectly blended, and add gradually as much vinegar as will make the sauce of the consistence of thick cream. Put it into bottles with an ounce of garlic, divided into cloves, and cork it tightly.

Footnote 66:

Hard acid fruit in a crude state is, we think, an ingredient not much to be recommended; and it is always better to deviate a little from "an approved receipt" than to endanger health by the use of ingredients of a questionable character. Gooseberries or tomatas, after being subjected to a moderate degree of heat, might be eaten with far less hazard.

Stoned raisins, 4 oz.; crabs, or other acid fruit, 1/2 lb.; coarse sugar, 4 oz.; powdered ginger, 2 oz.; salt, 2 oz.; cayenne pepper, 2 oz.; garlic, 1 oz.; vinegar, enough to dilute it properly.

Obs.—This favourite oriental sauce is compounded in a great variety of ways; but some kind of acid fruit is essential to it. The mango is used in India; here gooseberries, while still hard and green, are sometimes used for it; and ripe red chilies and tomatas are mixed with the other ingredients. The sauce keeps better if it be exposed to a gentle degree of heat for a week or two, either by the side of the fire, or in a full southern aspect in the sun: the heat of a _very slow_ oven, in which it might be left for a night, would probably have a still better effect. In this case it must be put into a jar or bottles, and well secured from the air. Half a pound of gooseberries, or of these and tamarinds from the shell, and green apples mixed, and the same weight of salt, stoned raisins, brown sugar, powdered ginger, chilies, and garlic, with a pint and a half of vinegar, and the juice of three large lemons, will make another genuine Bengal chetney.

FINE MUSHROOM CATSUP.

One of the very best and most useful of store sauces is good _home-made_ mushroom catsup, which, if really well prepared, imparts an agreeable flavour to any soup or sauce with which it is mingled, and at the same time heightens the colour without imparting the “bitter sweetness” which the burnt sugar used as “browning” in clumsy cookery so often does. The catsup ought, in fact, to be rather the pure _essence of mushrooms_, made with so much salt and spice only as are required to preserve it for a year or longer, than the compound of mushroom-juice, anchovies, shalots, allspice, and other condiments of which it is commonly composed, especially for sale.

Directions to be observed in making and for keeping the catsup.—Let the mushrooms be collected when the weather is dry, for if gathered during, or immediately after rain, the catsup made with them will not keep well.

Cut off the stalk-ends to which the earth adheres, before the mushrooms are broken up, and throw them aside, as they should never be used for the catsup. Reject also such of the flaps as are worm-eaten or decayed. Those which are too stale for use may be detected by the smell, which is very offensive.

When the mushroom first opens, the underside is of a fine pale salmon colour; this changes soon to a sort of ashy-brown, which deepens almost to black as the mushroom passes from its maturity to a state of decay. As it yields a greater abundance of juice when it is fully ripe, it is usually taken in that state for these sauces; but catsup of fine and delicate flavour, though somewhat pale in colour, can be made even of mushroom-buttons if they be sliced up small and turned often in the liquid which will be speedily drawn from them by the application of salt; a rather smaller proportion of which should be mingled with them than is directed for the following receipt.

Every thing used in preparing the catsup should be delicately clean and _very dry_. The bottles in which it is stored, after being dried in the usual way, should be laid into a cool oven for an hour or two before they are filled, to ensure their being free from the slightest degree of moisture, but they must be _quite cold_ before the catsup is poured into them. If the corks be sealed so as to exclude the air effectually, or if well-cleansed bits of bladder first dried, and then rendered flexible with a little spirit of any kind (spirits of wine is convenient for such purposes), be tied closely over them, and the bottles can be kept in a cool place free from damp, the catsup will remain good for a long time.

MUSHROOM CATSUP.

Receipt:—Break up small into a deep earthen pan, two gallons of large ripe mushroom-flaps, and strew amongst them three quarters of a pound of salt, reserving the larger portion of it for the top. Let them remain two days, and stir them gently with a wooden spoon often during the time; then turn them into a large stewpan or enamelled saucepan, heat them slowly, and simmer them for fifteen or twenty minutes. Strain the liquor closely from them without pressure; strain and measure it; put it into a very clean stewpan, and boil it quickly until it is reduced nearly half. For every quart allow half an ounce of black peppercorns and a drachm of mace; or, instead of the pepper, a quarter of a teaspoonful (ten grains) of _good_ cayenne; pour the catsup into a clean jug or jar, lay a folded cloth over it, and keep it in a cool place until the following day; pour it gently from the sediment, put into small bottles, cork them well, and rosin them down. A teaspoonful of salad oil may be poured into each bottle before it is corked, the better to exclude the air from the catsup.

Mushrooms, 2 gallons; salt, 3/4 lb.; to macerate three or four days. To each quart of liquor, 1/2 oz. black pepper, or quarter of a teaspoonful of cayenne; and 1 drachm of mace: to be reduced nearly half.

Obs. 1.—Catsup made thus will not be too salt, nor will the flavour of the mushrooms be overpowered by that of the spices; of which a larger quantity, and a greater variety, can be used at will.

We can, however, answer for the excellence of the present receipt from long experience of it. When the catsup is boiled down quite early in the day, it may be bottled the same night: it is necessary only, that it should _perfectly cold_ before this is done.

Obs. 2.—When the mushrooms are crushed, or mashed, as some authors direct, the liquor will necessarily be very thick; it is better to proceed as above, and then to boil the liquor which may afterwards be extracted from the mushrooms by pressure, with the sediment of the catsup, and sufficient cloves, pepper, allspice, and ginger, to flavour it highly: this _second_ catsup will be found very useful to mix with common thickened sauces, hashes, and stews.

MUSHROOM CATSUP.

(_Another Receipt._)

Break a peck of large mushrooms into a deep earthenpan; strew three quarters of a pound of salt amongst them, and set them into a very cool oven for one night, with a fold of cloth or paper over them. The following day strain off the liquor, measure, and boil it for fifteen minutes; then, for each quart, add an ounce of black pepper, a quarter of an ounce of allspice, half an ounce of ginger, and two large blades of mace, and let it boil fast for twenty minutes longer. When thoroughly cold, put it into bottles, cork them well, and dip the necks into melted bottle-cement, or seal them so as to secure the catsup from the air.

Mushrooms, 1 peck; salt, 3/4 lb. Liquor to boil, 15 minutes. To each quart, 1/2 oz. black pepper; 1/4 oz. allspice; 1/2 oz. ginger; 2 blades mace: 20 minutes.

DOUBLE MUSHROOM CATSUP.

On a gallon of fresh mushrooms strew three ounces of salt, and pour to them a quart of ready-made catsup (that which is a year old will do if it be perfectly good); keep these stirred occasionally for four days, then drain the liquor very dry from the mushrooms, and boil it for fifteen minutes with an ounce of whole black pepper, a drachm of mace, an ounce of ginger, and three or four grains only of cayenne.

Mushrooms, 1 gallon; salt, 3 oz.; mushroom catsup, 1 quart; peppercorns, 1 oz.; mace, 1 drachm; ginger, 1 oz.; cayenne, 3 to 4 grains: 15 minutes.

COMPOUND, OR COOK'S CATSUP.

Take a pint and a half of mushroom catsup when it is first made, and ready boiled (the double is best for the purpose), simmer in it for five minutes an ounce of small eschalots nicely peeled; add to these half a pint of walnut catsup, and a wineglassful of cayenne vinegar, or of chili vinegar; give the whole one boil, pour it out, and when cold, bottle it with the eschalots in it.

Mushroom catsup, 1-1/2 pint; eschalots, 1 oz.; walnut catsup or pickle, 1/2 pint; cayenne or chili vinegar, 1 wineglassful.

WALNUT CATSUP.

The vinegar in which walnuts have been pickled, when they have remained in it a year, will generally answer all the purposes for which this catsup is required, particularly if it be drained from them and boiled for a few minutes, with a little additional spice, and a few eschalots; but where the vinegar is objected to, it may be made either by boiling the expressed juice of young walnuts for an hour, with six ounces of fine anchovies, four ounces of eschalots, half an ounce of black pepper, a quarter of an ounce of cloves, and a drachm of mace, to every quart; or as follows:—

Pound in a mortar a hundred young walnuts, strewing amongst them as they are done half a pound of salt; then pour to them a quart of strong vinegar, and let them stand until they have become quite black, keeping them stirred three or four times a day; next add a quart of strong old beer, and boil the whole together for ten minutes; strain it, and let it remain until the next day; then pour it off clear from the sediment, add to it half a pound of anchovies, one large head of garlic bruised, half an ounce of nutmegs bruised, the same quantity of cloves and black pepper, and two drachms of mace: boil these together for half an hour, and the following day bottle and cork the catsup well. It will keep for a dozen years. Many persons add to it, before it is boiled, a bottle of port wine; and others recommend a large bunch of sweet herbs to be put in with the spice.

1st Recipe. Expressed juice of walnuts, 1 quart; anchovies, 6 oz.; eschalots, 4 oz.; black pepper, 1/2 oz.; cloves, 1/4 oz.; mace, 1 drachm: 1 hour.

2nd. Walnuts, 100; salt, 1/2 lb.; vinegar, 1 quart; to stand till black. Strong beer, 1 quart; anchovies, 1/2 lb.; 1 head garlic; nutmegs, 1/2 oz.; cloves, 1/2 oz.; black pepper, 1/2 oz.; mace, 2 drachms: 1/2 hour.

ANOTHER GOOD RECEIPT FOR WALNUT CATSUP.

Beat a hundred green walnuts in a large marble mortar until they are thoroughly bruised and broken, and then put them into a stone jar, with half a pound of eschalots, cut in slices, one head of garlic, half a pound of salt, and two quarts of vinegar; let them stand for

ten days, and stir them night and morning. Strain off the liquor, and boil it for half an hour with the addition of two ounces of anchovies, two of whole pepper, half an ounce of cloves, and two drachms of mace; skim it well, strain it off, and when it is quite cold pour it gently from the sediment (which may be reserved for flavouring common sauces) into small dry bottles, secure it from air by sound corking, and store it in a dry place.

Walnuts, 100; eschalots, 1/2 lb.; garlic, 1 head, salt, 1/2 lb.; vinegar, 2 quarts: 10 days. Anchovies, 2 oz.; black pepper, 2 oz.; mace, 1/4 oz.; cloves, 1/2 oz.: 1/2 hour.

LEMON PICKLE OR CATSUP.

Either divide six small lemons into quarters, remove all the pips that are in sight, and strew three ounces of salt upon them, and keep them turned in it for a week, or, merely make deep incisions in them, and proceed as directed for pickled lemons. When they have stood in a warm place for eight days, put into a stone jar two ounces and a half of finely-scraped horseradish, and two ounces of eschalots, or one and a half of garlic; to these add the lemons with all their liquor, and pour on them a pint and a half of boiling vinegar in which half an ounce of bruised ginger, a quarter of an ounce of whole white pepper, and two blades of mace have been simmered for two or three minutes. The pickle will be fit for use in two or three months, but may stand four or five before it is strained off.

Small lemons, 6; salt, 3 oz.: 8 days. Horseradish, 2-1/2 oz.; eschalots, 2 oz., or garlic 1-1/2 oz.; vinegar, 1-1/2 pint; ginger, 1/2 oz.; whole white pepper, 1/4 oz.; mace, 2 blades: 3 to 6 months.

Obs.—These highly-flavoured compounds are still much in favour with a certain class of housekeepers; but they belong exclusively to _English_ cookery: they are altogether opposed to the practice of the French _cuisine_, as well as to that of other foreign countries.

PONTAC CATSUP FOR FISH.

On one pint of ripe elderberries stripped from the stalks, pour three quarters of a pint of boiling vinegar, and let it stand in a cool oven all night; the next day strain off the liquid without pressure, and boil it for five minutes with a half-teaspoonful of salt, a small race of ginger, a blade of mace, forty corns of pepper, twelve cloves and four eschalots. Bottle it with the spice when it is quite cold.

BOTTLED TOMATAS, OR TOMATA CATSUP.

Cut half a peck of ripe tomatas into quarters; lay them on dishes and sprinkle over them half a pound of salt. The next day drain the juice from them through a hair-sieve into a stewpan, and boil it for half an hour with three dozens of small capsicums and half a pound of eschalots; then add the tomatas, which should be ready pulped through a strainer. Boil the whole for thirty minutes longer; have some clean wide-necked bottles, kept warm by the fire, fill them with the catsup while it is quite hot; cork, and dip the necks into melted bottle-resin or cement.

Tomatas, 1/2 peck; salt, 1/2 lb.; capsicums, 3 doz.; eschalots, 1/2 lb.: 1/2 hour. After pulp is added, 1/2 hour.

Obs.—This receipt has been kindly contributed by a person who makes by it every year large quantities of the catsup, which is considered excellent: for sauce it must be mixed with gravy or melted butter. We have not ourselves been able to make trial of it.

EPICUREAN SAUCE.

Mix well, by shaking them in a bottle, a wineglassful of Indian soy, half a pint of chili vinegar, half a pint of walnut catsup, and a pint and a half of the best mushroom catsup. These proportions make an excellent sauce, either to mix with melted butter, and to serve with fish, or to add to different kinds of gravy; but they can be varied, or added to, at pleasure.

Indian soy, 1 wineglassful; chili vinegar, 1/2 pint; walnut catsup, 1/2 pint; mushroom catsup, 1-1/2 pint.

TARRAGON VINEGAR.

Gather the tarragon just before it blossoms, which will be late in July, or early in August; strip it from the larger stalks, and put it into small stone jars or wide-necked bottles, and in doing this twist some of the branches so as to bruise the leaves and wring them

asunder; then pour in sufficient distilled or very pale vinegar to cover the tarragon; let it infuse for two months, or more: it will take no harm even by standing all the winter. When it is poured off, strain it very clear, put it into small dry bottles, and cork them well. Sweet basil vinegar is made in exactly the same way, but it should not be left on the leaves more than three weeks. The jars or bottles should be filled to the neck with the tarragon before the vinegar is added: its flavour is strong and peculiar, but to many tastes very agreeable. It imparts quite a foreign character to the dishes for which it is used.

GREEN MINT VINEGAR.

Slightly chop, or bruise, freshly-gathered mint, and put it into bottles; fill them nearly to the necks, and add vinegar as for tarragon: in forty days, strain it off, and bottle it for use. The mint itself, ready minced for sauce, will keep well in vinegar, though the colour will not be very good. The young leaves stripped from the stems, should be used for this preparation.

CUCUMBER VINEGAR.

First wipe, and then, without paring, slice into a stone jar some young and quickly-grown cucumbers; pour on them as much boiling vinegar as will cover them well, with a teaspoonful of salt, and two-thirds as much of peppercorns to the pint and a half of vinegar: it may remain on them for a month, or even for two, if well defended from the air: it should then be strained, allowed to settle, and poured quite clear into small dry bottles, which should be well corked. A mild onion can be intermixed with the cucumbers, when its flavour is considered an improvement.

CELERY VINEGAR.

Throw into a pint and a half of ready boiling vinegar a few grains of cayenne, or half an ounce of peppercorns, a large saltspoonful of salt, and a pint of the white part of the roots and stems of some fine fresh celery sliced up thin: let it boil for two or three minutes, turn it into a stone jar, and secure it well from the air as soon as it is cold. It may be strained off and bottled in three or four weeks, but may remain as many months in the jar without injury.

ESCHALOT, OR GARLIC VINEGAR.

On from four to six ounces of eschalots or on two of garlic peeled and bruised, pour a quart of the best vinegar; stop the jar or bottle close, and in a fortnight or three weeks the vinegar may be strained off for use: a few drops will give a sufficient flavour to a sauce, or to a tureen of gravy.

Eschalots, 4 to 6 oz.; or, garlic, 2 to 4 oz.; vinegar, 1 quart: 15 to 21 days.

Obs.—These roots may be used in smaller or in larger proportion, as a slighter or a stronger flavour of them is desired, and may remain longer in the vinegar without any detriment to it.

ESCHALOT WINE.

This is a far more useful preparation even than the preceding one, since it can be used to impart the flavour of the eschalot to dishes for which acid is not required. Peel and slice, or bruise, four ounces of eschalots, put them into a bottle, and add to them a pint of sherry; in a fortnight pour off the wine, and should it not be strongly flavoured with the eschalots, steep in it two ounces more, for another fortnight; a half-teaspoonful of cayenne may be added at first. The bottle should be shaken occasionally, while the eschalots are infusing, but should remain undisturbed for the last two or three days, that the wine may be clear when it is poured off to bottle for keeping. Sweet-basil wine is made by steeping the fresh leaves of the herb in wine, from ten to fifteen days.

Eschalots, 4 oz.; sherry, 1 pint: 15 days, or more.

HORSERADISH VINEGAR.

On four ounces of young and freshly-scraped horseradish pour a quart of boiling vinegar, and cover it down closely: it will be ready for use in three or four days, but may remain for weeks, or months, before the vinegar is poured off. An ounce of minced eschalot may be substituted for one of the horseradish, if the flavour be liked.

CAYENNE VINEGAR.

Put from a quarter to half an ounce of the best cayenne pepper into a bottle, and pour on it a pint of pale vinegar. Cork it closely, and shake it well every two or three days. It may remain any length of time before it is poured off, but will very soon be ready for use.

Good cayenne pepper, 1/4 to 1/2 oz.; vinegar, 1 pint: infuse from 2 weeks to 12 months.

LEMON BRANDY.

(_For flavouring sweet dishes._)

Fill any sized wide-necked bottle lightly with the very thin rinds of fresh lemons, and cover them with good brandy; let them remain for a fortnight or three weeks only, then strain off the spirit and keep it well corked for use: a few apricot-kernels blanched and infused with the lemon-rind will give it an agreeable flavour.

DRIED MUSHROOMS.

Peel small, sound, freshly-gathered flaps, cut off the stems, and scrape out the fur entirely; then arrange the mushrooms singly on tins or dishes, and dry them as gradually as possible in a gentle oven. Put them, when they are done, into tin canisters, and store them where they will be secure from damp. French cooks give them a single boil in water, from which they then are well drained, and dried, as usual. When wanted for table, they should be put into cold gravy, slowly heated, and gently simmered, until they are tender.

MUSHROOM POWDER.

When the mushrooms have been prepared with great nicety, and dried, as in the foregoing receipt, pound them to a very fine powder; sift it, and put it immediately into small and _perfectly dry_ bottles; cork and seal them without delay, for if the powder be long exposed to the air, so as to imbibe any humidity, or if it be not well secured from it in the bottles, it will be likely to become putrid: much of that which is purchased, even at the best Italian warehouses, is found to be so, and, as it is sold at a very high price, it is a great economy, as well as a surer plan, to have it carefully prepared at home. It is an exceedingly useful store, and an excellent addition to many dishes and sauces. To insure its being good, the mushrooms should be gathered in dry weather, and if any addition of spices be made to the powder (some persons mix with it a seasoning of mace and cayenne), they should be put into the oven for a while before they are used: but even these precautions will not be sufficient, unless the powder be stored in a very dry place after it is bottled. A teaspoonful of it, with a quarter of a pint of strong veal gravy, as much cream, and a small dessertspoonful of flour, will make a good _béchamel_ or white sauce.

EXCELLENT POTATO FLOUR, OR ARROW-ROOT.

(_Fecule de Pommes de terre._)

Grate into a large vessel full of cold water, six pounds of sound mealy potatoes, and stir them well together. In six hours pour off the water, and add fresh, stirring the mixture well; repeat this process every three or four hours during the day, change the water at night, and the next morning pour it off; put two or three quarts more to the potatoes, and turn them directly into a hair-sieve, set over a pan to receive the flour, which may then be washed through the sieve, by pouring water to it. Let it settle in the pan, drain off the water, spread the potato-sediment on dishes, dry it in a slow oven, sift it, and put it into bottles or jars, and cork or cover them closely. The flour thus made will be beautifully white, and perfectly flavourless. It will remain good for years.

Obs.—This admirable farina, or _starch_ of potatoes, is now much more widely known and vended in England than it was some years since. It can at present be procured at most foreign warehouses and general grocers'; but we would recommend its being _home-made_ by the directions given above, which we have had closely followed for many years with the best possible success.

TO MAKE FLOUR OF RICE.

Take any quantity of whole rice, wash it thoroughly, changing the water several times; drain and press it in a cloth, then spread it on a dish, and dry it perfectly; beat it in a mortar to a smooth powder, and sift it through a fine sieve. When used to thicken soup or

sauces, mix it with a small quantity of cold water or of broth, and pour it to them while they are boiling.

This flour, when newly made, is of much purer flavour than any usually prepared for sale.

POWDER OF SAVOURY HERBS.

All herbs which are to be dried for storing should be gathered in fine weather; cleared from dirt and decayed leaves; and dried quickly, but without scorching, in a Dutch oven before the fire, or in any other that is not too much heated. The leaves should then be stripped from the stalks, pounded, sifted, and closely corked in separate bottles; or several kinds may be mixed and pounded together for the convenience of seasoning in an instant gravies, soups, forcemeats, and made dishes: appropriate spices, celery-seed, and dried lemon-peel, all in fine powder, can be added to the herbs.

TARTAR MUSTARD.

Rub four ounces of the best Durham mustard very smooth with a full teaspoonful of salt, and wet it by degrees with strong horseradish vinegar, a dessertspoonful of cayenne, or of chili vinegar, and one or two of tarragon vinegar when its flavour is not disliked. A quarter of a pint of vinegar poured boiling upon an ounce of scraped horseradish, and left for one night, closely covered, will be ready to use for this mustard, but it will be better for standing two or three days.

Durham mustard, 4 oz.; salt, large teaspoonful; cayenne, or chili vinegar, 1 dessertspoonful; horseradish vinegar, third of pint.

Obs.—This is an exceedingly pungent compound, but has many approvers.

ANOTHER TARTAR MUSTARD.

Mix the salt and mustard smoothly, with equal parts of horseradish vinegar, and of chili vinegar. Mustard made by these receipts will keep long, if put into jars or bottles and closely corked. Cucumber, eschalot, or any other of the flavoured vinegars for which we have given receipts, may in turn be used for it, and mushroom, gherkin, or India pickle-liquor, likewise.

CHAPTER VIII.

=Forcemeats.=

GENERAL REMARKS.

[Illustration:

Weighing Machine.]

THE coarse and unpalatable compounds so constantly met with under the denomination of forcemeat, even at tables otherwise tolerably well served, show with how little attention they are commonly prepared.

Many very indifferent cooks pique themselves on never doing any thing by rule, and the consequence of their throwing together at random (or “by guess” as they call it) the ingredients which ought to be proportioned with exceeding exactness is repeated failure in all they attempt to do. Long experience, and a very correct eye may, it is true, enable a person to dispense with weights and measures without hazarding the success of their operations; but it is an experiment which the learner will do better to avoid.

A large marble or Wedgwood mortar is indispensable in making all the finer kinds of forcemeat; and equally so indeed for many other purposes in cookery; no kitchen, therefore, should be without one;[67] and for whatever preparation it may be used, the pounding should be continued with patience and perseverance until not a single lump or fibre be perceptible in the mass of the articles beaten together. This particularly applies to potted meats, which should resemble the smoothest paste; as well as to several varieties of forcemeat. Of these last it should be observed, that such as are made by the French method (see _quenelles_, page 163) are the most appropriate for an elegant dinner, either to serve in soups or to fill boned poultry of any kind; but when their exceeding lightness, which to foreigners constitutes one of their great excellences, is objected to, it may be remedied by substituting dry crumbs of bread for the panada, and pounding a small quantity of the lean of a boiled ham, with the other

ingredients: however, this should be done only for the balls.

Footnote 67:

Two or three mortars, varying in size, should be in every household where it is expected that the cookery should be well conducted: they are often required also for many other domestic purposes, yet it is not unusual to find both these and scales, weights, and measures of every kind, altogether wanting in English kitchens.

No particular herb or spice should be allowed to predominate powerfully in these compositions; but the whole of the seasonings should be taken in such quantity only as will produce an agreeable savour when they are blended together.

NO. 1. GOOD COMMON FORCEMEAT, FOR ROAST VEAL, TURKEYS, &C.

Grate very lightly into exceedingly fine crumbs, four ounces of the inside of a stale loaf, and mix thoroughly with it, a quarter of an ounce of lemon-rind pared as thin as possible, and minced extremely small; the same quantity of savoury herbs, of which two-thirds should be parsley, and one-third thyme, likewise finely minced, a little grated nutmeg, a half teaspoonful of salt, and as much common pepper or cayenne as will season the forcemeat sufficiently. Break into these, two ounces of good butter in very small bits, add the unbeaten yolk of one egg, and with the fingers work the whole well together until it is smoothly mixed. It is usual to chop the lemon-rind, but we prefer it lightly grated on a fine grater. It should always be _fresh_ for the purpose, or it will be likely to impart a very unpleasant flavour to the forcemeat. Half the rind of a moderate-sized lemon will be sufficient for this quantity; which for a large turkey must be increased one-half.

Bread-crumbs, 4 oz.; lemon-rind, 1/4 oz. (or grated rind of 1/2 lemon); mixed savoury herbs, minced, 1/4 oz.; salt, 1/2 teaspoonful; pepper, 1/4 to 1/3 of teaspoonful; butter, 2 oz.; yolk, 1 egg.

Obs.—This, to our taste, is a much nicer and more delicate forcemeat than that which is made with suet, and we would recommend it for trial in preference. Any variety of herb or spice may be used to give it flavour, and a little minced onion or eschalot can be added to it also; but these last do not appear to us suited to the meats for which the forcemeat is more particularly intended. Half an ounce of the butter may be omitted on ordinary occasions: and a portion of marjoram or of sweet basil may take the place of part of the thyme and parsley when preferred to them.

NO. 2. ANOTHER GOOD COMMON FORCEMEAT.

Add to four ounces of bread-crumbs two of the lean of a boiled ham, quite free from sinew, and _very_ finely minced; two of good butter, a dessertspoonful of herbs, chopped small, some lemon-grate, nutmeg, a little salt, a good seasoning of pepper or cayenne and one whole egg, or the yolks of two. This may be fried in balls of moderate size, for five minutes, to serve with roast veal, or it may be put into the joint in the usual way.

Bread-crumbs, 4 oz.; lean of ham, 2 oz.; butter, 2 oz.; minced herbs, 1 dessertspoonful; lemon-grate, 1 teaspoonful; nutmeg, mace, and cayenne, together, 1 small teaspoonful; little salt; 1 whole egg, or yolks of 2.

NO. 3. SUPERIOR SUET FORCEMEAT, FOR VEAL, TURKEYS, &C.

Mix well together six ounces of fine stale crumbs, with an equal weight of beef-kidney suet, chopped extremely small, a large dessertspoonful of parsley, mixed with a little lemon-thyme, a teaspoonful of salt, a quarter one of cayenne, and a saltspoonful or rather more of mace and nutmeg together; work these up with three unbeaten egg-yolks, and three teaspoonsful of milk; then put the forcemeat into a large mortar, and pound it perfectly smooth. Take it out, and let it remain in a cool place for half an hour at least before it is used; then roll it into balls, if it be wanted to serve in that form; flour and fry them gently from seven to eight minutes, and dry them well before they are dished.

Beef suet finely minced, 6 oz.; bread-crumbs, 6 oz.; parsley, mixed with little thyme, 1 large dessertspoonful; salt, 1 teaspoonful; mace, large saltspoonful, and one fourth as much cayenne; unbeaten egg-yolks, 3; milk, 3 teaspoonsful: well pounded. Fried in balls, 7 to 8 minutes, or poached, 6 to 7.

Obs.—The finely grated rind of half a lemon can be added to this forcemeat at pleasure; and for some purposes a _morsel_ of garlic, or three or four minced eschalots, may be mixed with it before it is put into the mortar.

NO. 4. COMMON SUET FORCEMEAT.

Beef suet is commonly used in the composition of this kind of forcemeat, but we think that veal-kidney suet, when it could be obtained, would have a better effect; though the reader will easily comprehend that it is scarcely possible for us to have every variety of every receipt which we insert put to the test; in some cases we are compelled merely to suggest what appear to us likely to be improvements. Strip carefully every morsel of skin from the suet, and mince it small; to six ounces add eight of bread-crumbs, with the same proportion of herbs, spice, salt, and lemon-peel, as in the foregoing receipt, and a couple of whole eggs, which should be very slightly beaten, after the specks have been taken out with the point of a small fork. Should more liquid be required, the yolk of another egg, or a spoonful or two of milk, may be used. Half this quantity will be sufficient for a small joint of veal, or for a dozen balls, which, when it is more convenient to serve it in that form, may be fried or browned beneath the roast, and then dished round it, though this last is not a very refined mode of dressing them. From eight to ten minutes will fry them well.

NO. 5. OYSTER FORCEMEAT.

Open carefully a dozen of fine plump natives, take off the beards, strain their liquor, and rinse the oysters in it. Grate four ounces of the crumb of a stale loaf into fine light crumbs, mince the oysters but not too small, and mix them with the bread; add an ounce and a half of good butter broken into minute bits, the grated rind of half a small lemon, a small saltspoonful of pounded mace, some cayenne, a little salt, and a large teaspoonful of parsley. Mingle these ingredients well, and work them together with the unbeaten yolk of one egg and a little of the oyster liquor, the remainder of which can be added to the sauce which usually accompanies this forcemeat.

Oysters, 1 dozen; bread-crumbs, 4 oz.; butter, 1-1/2 oz.; rind 1/2 small lemon; mace, 1 saltspoonful; some cayenne and salt; minced parsley, 1 large teaspoonful; yolk 1 egg; oyster-liquor, 1 dessertspoonful: rolled into balls, and fried from 7 to 10 minutes, or poached from 5 to 6 minutes.

Obs. 1.—In this preparation the flavour of the oysters should prevail entirely over that of all the other ingredients which are mixed with them.

Obs. 2.—The oyster-sausages of Chapter III. will serve excellently for forcemeat also.

NO. 6. A FINER OYSTER FORCEMEAT.

Pound the preceding forcemeat to the smoothest paste, with the addition only of half an ounce of fresh butter, should it be sufficiently dry to allow of it. It is remarkably good when thus prepared, and may be poached or fried in balls for soups or made dishes, or used to fill boned fowls, or the breasts of boiled turkeys with equally good effect.

NO. 7. MUSHROOM FORCEMEAT.

Cut closely off the stems of some small, just-opened mushrooms, peel them, and take out the fur. Dissolve an ounce and a half of good butter in a saucepan, throw them into it with a little cayenne and a slight sprinkling of mace, and stew them softly, keeping them well shaken, from five to seven minutes; then turn them into a dish, spread them over it, and raise one end, that the liquid may drain from them. When they are quite cold, mince, and then mix them with four ounces of fine bread-crumbs, an ounce and a half of good butter, and _part_ of that in which they were stewed should the forcemeat appear too moist to admit of the whole, as the yolk of one egg, at the least, must be added, to bind the ingredients together; strew in a saltspoonful of salt, a third as much of cayenne, and about the same quantity of mace and nutmeg, with a teaspoonful of grated lemon-rind. The seasonings must be rather sparingly used, that the flavour of the mushrooms may not be overpowered by them. Mix the whole thoroughly with the unbeaten yolk of one egg, or of two, and use the forcemeat poached in small balls for soup, or fried and served in the dish with roast fowls, or round minced veal; or to fill boiled fowls, partridges, or turkeys.

Small mushrooms, peeled and trimmed, 4 oz.; butter 1-1/2 oz.; slight sprinkling mace and cayenne: 5 to 7 minutes. Mushrooms minced; bread-crumbs, 4 oz.; butter, 1-1/2 oz. (with part of that used in the stewing); salt, 1 saltspoonful; third as much of cayenne, of mace, and of nutmeg; grated lemon-rind, 1 teaspoonful; yolk of 1 or 2 eggs. In balls, poached, 5 to 6 minutes; fried, 6 to 8 minutes.

Obs.—This, like most other forcemeats, is improved by being well beaten in a large mortar after it is entirely mixed.

NO. 8. FORCEMEAT FOR HARE.

The first receipt of this chapter will be found very good for hare without any variation; but the liver boiled for three minutes and finely minced, may be added to it when it is thought an improvement: another half ounce of butter, and a small portion more of egg will then be required. A couple of ounces of rasped bacon, and a glass of port-wine, are sometimes recommended for this forcemeat, but we think it is better without them, especially when slices of bacon are used to line the hare. A flavouring of minced onion or eschalot can be added when the taste is in its favour; or the forcemeat No. 3 may be substituted for this altogether.

NO. 9. ONION AND SAGE STUFFING, FOR PORK, GEESE, OR DUCKS.

Boil three large onions from ten to fifteen minutes, press the water from them, chop them small, and mix with them an equal quantity of bread-crumbs, a heaped tablespoonful of minced sage, an ounce of butter, a half saltspoonful of pepper, and twice as much of salt, and put them into the body of the goose; part of the liver boiled for two or three minutes and shred fine, is sometimes added to these, and the whole is bound together with the yolk of one egg or two; but they are quite as frequently served without. The onions can be used raw, when their very strong flavour is not objected to, but the odour of the whole dish will then be somewhat overpowering.

Large onions, 3; boiled 20 to 30 minutes. Sage, 2 to 3 dessertspoonsful (or 1/2 to 3/4 oz.); butter, 1 oz.; pepper, 1/2 teaspoonful; salt, 1 teaspoonful.

The body of a goose is sometimes entirely filled with mashed potatoes, seasoned with salt and pepper only; or mixed with a small quantity of eschalot, onion, or herb-seasonings.

NO. 10. MR. COOKE'S FORCEMEAT FOR DUCKS OR GEESE.

Two parts of chopped onion, two parts of bread-crumbs, three of butter, one of pounded sage, and a seasoning of pepper and salt. This receipt we have not proved.

NO. 11. FORCEMEAT BALLS FOR MOCK TURTLE SOUPS.

The French forcemeat, No. 17 of the present Chapter, is the most refined and appropriate forcemeat to serve in mock turtle, but a more solid and highly seasoned one is usually added to it in this country. In very common cookery the ingredients are merely chopped small and mixed together with a moistening of eggs; but when the trouble of pounding and blending them properly is objected to, we would recommend the common veal forcemeat No. 1, in preference; as the undressed veal and suet, when merely minced, do not produce a good effect. Four ounces each of these, with an ounce or so of the lean of a boiled ham, and three ounces of bread-crumbs, a large dessertspoonful of minced parsley, a small portion of thyme or marjoram, a saltspoonful of white pepper, twice as much or more of salt, a little cayenne, half a small nutmeg, and a couple of eggs, well mixed with a fork first to separate the meat, and after the moistening is added, with the fingers, then rolled into balls, and boiled in a little soup for twelve minutes, is the manner in which it is prepared; but the reader will find the following receipt very superior to it:—Rasp, that is to say, scrape with a knife clear from the fibre, four ounces of veal, which should be cut into thick slices, and taken quite free from skin and fat; chop it fine, and then pound it as smoothly as possible in a large mortar, with three ounces of the rasped fat of an unboiled ham of good flavour or of the finest bacon, and one of butter, two ounces of bread-crumbs, a tablespoonful of the lean of a boiled ham, should it be at hand, a good seasoning of cayenne, nutmeg, and mace, mixed together, a heaped dessertspoonful of minced herbs, and the yolks of two eggs; poach a small bit when it is mixed, and add any further seasoning it may require; and when it is of good flavour, roll it into balls of moderate size, and boil them twelve minutes; then drain and drop them into the soup. No forcemeat should be boiled in the soup itself, on account of the fat which would escape from it in the process; a little stock should be reserved for the purpose.

Very common:—Lean of neck of veal, 4 oz.; beef-kidney suet, 4 oz., both finely chopped; bread-crumbs, 3 oz.; minced parsley, large dessertspoonful; thyme or marjoram, _small_ teaspoonful; lean of boiled ham, 1 to 2 oz.; white pepper, 1 saltspoonful; salt, twice as much; 1/2 small nutmeg; eggs, 2: in balls, 12 minutes.

Better forcemeat:—Lean veal rasped, 4 oz.; fat of unboiled ham, or finest bacon, 3 oz; butter, 1 oz.; bread-crumbs, 2 oz.; lean of boiled ham, minced, 1 large tablespoonful; minced herbs, 1 heaped dessertspoonful; full seasoning of mace, nutmeg, and cayenne, mixed; yolks of eggs, 2: 12 minutes.

NO. 12. EGG BALLS.

Boil four or five new-laid eggs for ten or twelve minutes, and lay them into fresh water until they are cold. Take out the yolks, and pound them smoothly with the beaten yolk of one raw egg, or more, if required; add a little salt and cayenne, roll the mixture into balls the size of marbles, and boil them for two minutes. Half a teaspoonful of flour is sometimes worked up with the eggs.

Hard yolks of eggs, 4; 1 raw; little salt and cayenne: 2 minutes.

NO. 13. BRAIN CAKES.

Wash and soak the brains well in cold water, and afterwards in hot; free them from the skin and large fibres, and boil them in water, slightly salted, from two to three minutes; beat them up with a teaspoonful of sage very finely chopped, or with equal parts of sage and parsley, half a teaspoonful or rather more of salt, half as much mace, a little white pepper or cayenne, and one egg; drop them in small cakes into the pan, and fry them in butter a fine light brown: two yolks of eggs will make the cakes more delicate than the white and yolk of one. A teaspoonful of flour and a little lemon-grate are sometimes added.

NO. 14. ANOTHER RECEIPT FOR BRAIN CAKES.

Boil the brains in a little good veal gravy very gently for ten minutes; drain them on a sieve, and when cold cut them into thick dice; dip them into beaten yolk of egg, and then into very fine bread-crumbs, mixed with salt, pounded spices, and fine herbs minced extremely small; fry them of a light brown, drain and dry them well, and drop them into the soup or hash after it is dished. When broth or gravy is not at hand, the brains may be boiled in water.

NO. 15. CHESTNUT FORCEMEAT.

Strip the outer skin from some fine sound chestnuts, then throw them into a saucepan of hot water, and set them over the fire for a minute or two, when they may easily be blanched like almonds. Put them into cold water as they are peeled. Dry them in a cloth, and weigh them. Stew six ounces of them _very_ gently from fifteen to twenty minutes, in just sufficient strong veal gravy to cover them. Take them up, drain them on a sieve, and when cold pound them perfectly smooth with half their weight of the nicest bacon rasped clear from all rust or fibre, or with an equal quantity of fresh butter, two ounces of dry bread-crumbs, a small teaspoonful of grated lemon rind, one of salt, half as much mace or nutmeg, a moderate quantity of cayenne, and the unbeaten yolks of two or of three eggs. This mixture makes most excellent forcemeat cakes, which must be moulded with a knife, a spoon, or the fingers, dipped in flour; more should be dredged over, and pressed upon them, and they should be slowly fried from ten to fifteen minutes.

Chestnuts, 6 oz.; veal gravy, 1/3 of a pint: 15 to 20 minutes. Bacon or butter, 3 oz.; bread-crumbs, 2 oz.; lemon-peel and salt, 1 teaspoonful each.

NO. 16. AN EXCELLENT FRENCH FORCEMEAT.

Take six ounces of veal free from fat and skin, cut it into dice and put it into a saucepan with two ounces of butter, a large teaspoonful of parsley finely minced, half as much thyme, salt, and grated lemon-rind, and a sufficient seasoning of nutmeg, cayenne, and mace, to flavour it pleasantly. Stew these _very_ gently from twelve to fifteen minutes, then lift out the veal and put into the saucepan two ounces of bread-crumbs; let them simmer until they have absorbed the gravy yielded by the meat; keep them stirred until they are as dry as possible; beat the yolk of an egg to them while they are hot, and set them aside to cool. Mince and pound the veal, add the bread to it as soon as it is cold, beat them well together, with an ounce and a half of fresh butter, and two of the finest bacon, quite freed from rust, and scraped clear of skin and fibre; put to them the yolks of two small eggs and mix them well; then take the forcemeat from the mortar, and set it in a very cool place until it is wanted for use. Veal, 6 oz.; butter, 2 oz.; minced parsley, 1 teaspoonful; thyme, salt, and lemon-peel, each 1/2 teaspoonful; little nutmeg, cayenne, and mace: 12 to 15 minutes. Bread-crumbs, 2 oz.; butter, 1-1/2 oz.; rasped bacon, 2 oz.; yolk of eggs, 2 to 3.

Obs.—When this forcemeat is intended to fill boned fowls, the livers of two or three boiled for four minutes, or stewed with the veal for the same length of time, then minced and pounded with the other ingredients, will be found a great improvement; and, if mushrooms can be procured, two tablespoonsful of them chopped small, should be stewed and beaten with it also. A small portion of the best end of the neck will afford the quantity of lean required for this receipt, and the remains of it will make excellent gravy.

NO. 17. FRENCH FORCEMEAT CALLED QUENELLES.

This is a peculiarly light and delicate kind of forcemeat, which by good French cooks is compounded with exceeding care. It is served abroad in a variety of forms, and is made of very finely-grained white veal, or of the undressed flesh of poultry, or of rabbits, rasped quite free from sinew, then chopped and pounded to the finest paste, first by itself, and afterwards with an equal quantity of boiled calf's udder or of butter, and of _panada_, which is but another name for bread soaked in cream or gravy and then dried over the fire until it forms a sort of paste. As the three ingredients should be equal in _volume_, not in weight, they are each rolled into a separate ball before they are mixed, that their size may be determined by the eye. When the fat of the fillet of veal (which in England is not often divided for sale, as it is in France) is not to be procured, a rather less proportion of butter will serve in its stead. The following will be found a very good, and not a troublesome receipt for veal forcemeat of this kind.

Rasp quite clear from sinew, after the fat and skin have been entirely cleared from it, four ounces of the finest veal; chop, and pound it well: if it be carefully prepared there will be no necessity for passing it through a sieve, but this should otherwise be done. Soak in a small saucepan two ounces of the crumb of a stale loaf in a little rich but pale veal gravy or white sauce; then press and drain as much as possible of the moisture from it, and stir it over a gentle fire until it is as dry as it will become without burning: it will adhere in a ball to the spoon, and leave the saucepan quite dry when it is sufficiently done. Mix with it, while it is still hot, the yolk of one egg, and when it is quite cold, add it to the veal with three ounces of very fresh butter, a quarter of a teaspoonful of mace, half as much cayenne, a little nutmeg, and a saltspoonful of salt. When these are perfectly beaten and well blended together, add another whole egg after having merely taken out the specks: the mixture will then be ready for use, and may be moulded into balls, or small thick oval shapes a little flattened, and poached in soup or gravy from ten to fifteen minutes. These _quenelles_ may be served by themselves in a rich sauce as a corner dish, or in conjunction with other things. They may likewise be first poached for three or four minutes, and left on a drainer to become cold; then dipped into egg and the finest bread-crumbs and fried, and served as _croquettes_.

NO. 18. FORCEMEAT FOR RAISED AND OTHER COLD PIES.

The very finest sausage-meat highly seasoned, and made with an equal proportion of fat and lean, is an exceedingly good forcemeat for veal, chicken, rabbit, and some few other pies; savoury herbs minced small may be added to heighten its flavour if it be intended for immediate eating; but it will not then remain good quite so long, unless they should have been previously dried. To prevent its being too dry, two or three spoonsful of cold water should be mixed with it before it is put into the pie. One pound of lean veal to one and a quarter of the pork-fat is sometimes used, and smoothly pounded with a high seasoning of spices, herbs, and eschalots, or garlic; but we cannot recommend the introduction of these last into pies unless they are especially ordered: mushrooms or truffles may be mixed with any kind of forcemeat with far better effect. Equal parts of veal and fat bacon, will also make a good forcemeat for pies, if chopped finely, and well spiced.

Sausage-meat, well seasoned. Or: veal, 1 lb.; pork-fat, 1-1/2 lb.; salt, 1 oz.; pepper, 1/4 to 1/2 oz.; fine herbs, spice, &c., as in forcemeat No. 1, or sausage-meat. Or: veal and bacon, equal weight, seasoned in the same way.

PANADA.

This is the name given to the soaked bread which is mixed with the French forcemeats, and which renders them so peculiarly delicate. Pour on the crumb of two or three rolls, or on that of any other very light bread, as much good boiling broth, milk, or cream, as will cover and moisten it well; put a plate over to keep in the steam, and let it remain for half an hour, or more; then drain off the superfluous liquid, and squeeze the panada dry by wringing it in a thin cloth into a ball; put it into a small stewpan or enamelled saucepan, and pour to it as much only of rich white sauce or of gravy as it can easily absorb, and stir it constantly with a wooden spoon over a clear and gentle fire, until it forms a very dry paste and adheres in a mass to the spoon; when it is in this state, mix with it thoroughly the unbeaten yolks of two fresh eggs, which will give it firmness, and set it aside to become quite cold before it is put into the mortar. The best French cooks give the highest degree of savour that they can to this panada, and add no other seasoning to the forcemeats of which it forms a part: it is used in an equal proportion with the meat, and with the calf's udder or butter of which they are composed, as we have shown in the preceding receipt for _quenelles_. They stew slowly for the purpose, a small bit of lean ham, two or three minced eschalots, a bay-leaf, a few mushrooms, a little parsley, a clove or two, and a small blade of mace in a little good butter, and when they are sufficiently browned, pour to them as much broth or gravy as will be needed for the panada; and when this has simmered from twenty to thirty minutes, so as to have acquired the proper flavour without being much reduced, they strain it over, and boil it into the bread. The common course of cookery in an English kitchen does not often

require the practice of the greater niceties and refinements of the art: and _trouble_ (of which the French appear to be perfectly regardless when the excellence of their preparations is concerned) is there in general so much thought of, and exclaimed against, that a more summary process would probably meet with a better chance of success.

A quicker and rougher mode of making the panada, and indeed the forcemeat altogether, is to pour strong veal broth or gravy upon it, and after it has soaked, to boil it dry, without any addition except that of a little fine spice, lemon-grate, or any other favourite English seasoning. Minced herbs, salt, cayenne, and mace, may be beaten with the meat, to which a small portion of well-pounded ham may likewise be added at pleasure.

CHAPTER IX.

=Boiling, Roasting, etc.=

A THOROUGH practical knowledge of the processes described in the present chapter will form a really good cook far sooner and more completely than any array of mere receipts can do, however minutely they may be explained; they should, therefore, be well studied and comprehended, before any attempt is made to compound difficult dishes; and the principles of roasting, boiling, stewing, and baking, at least, ought to be clearly understood by every servant who undertakes the duties of what is called _plain cookery_, which is, in fact, of more importance than any other, because it is in almost universal request in this country for families of moderate fortune; and any person who excels in it will easily become expert in what are considered the higher branches of the art.

In a vast number of English kitchens the cookery fails from the hurried manner in which it is conducted, and from the excess of heat produced by the enormous coal-fires constantly kept burning there at all seasons, without which ignorant servants imagine no dinner can be properly cooked; a mistake which cannot fail quickly to become apparent to the most inexperienced reader who will give a patient trial to the slow methods of cooking recommended in the following pages. These will be found to combine exceeding economy in the consumption of fuel, with a degree of superiority in the food prepared by them, which would scarcely be credited unless it were put to the test. In stewing, and baking in closely covered vessels, this superiority is more particularly remarkable; and we would willingly give a far larger space to so useful a subject than our limits will permit: we are, however, compelled, though with regret, to restrict ourselves to such details as we have now supplied in various parts of this volume.

TO BOIL MEAT.

[Illustration:

Iron Boiler.]

Boiling, in the usual English manner, is the least advantageous of all modes of cooking meat, because a large portion of the nourishment which it contains is withdrawn from it in the process, and it is usually very insipid in flavour.

We have already given, at the commencement of Chapter I., the substance of Liebeg’s instructions for scientific boiling; but for the convenience of the reader, we will briefly recapitulate them here, with such additions as our own observation has enabled us to supply.

In making soup, gravy, or savoury jelly of any kind, the principal object is to extract from the meat used for the preparation, all the nutriment and savour which it can be made to yield. This is effected by putting it into _cold_ water, and heating it very slowly indeed, and then keeping it for a specified time at the point of boiling, or letting it simmer in the gentlest manner; but when the meat itself is required for food, its nutritious juices must be prevented from escaping as much as possible, which is done by plunging it into fast boiling water for a few minutes, to contract the pores of the surface (to harden it, in fact), and adding immediately afterwards as much cold water as will reduce the whole to a moderate temperature. Part of the water should then be taken away, as meat should never be cooked in a larger quantity than is absolutely needed to keep it entirely covered until it is ready to serve; for this reason it should be always boiled in a vessel nearly of its own size.

Large joints should be neatly trimmed, washed extremely clean, and skewered or bound firmly into good shape, when they are of a nature to require it; brought to boil over a moderate fire, and simmered until they are done, the scum being carefully and entirely cleared from the surface of the water, as it gathers there, which will be principally from within a few minutes of its beginning to boil,

and during a few minutes afterwards. If not thoroughly skimmed off at the proper time, it will sink, and adhere to the joint, giving it a very uninviting appearance.

Pickled or salted meat requires longer boiling than fresh; and that which is smoked and dried longer still: this last should always be laid into _cold_ water, slowly heated, and if, from any circumstances, time cannot have been allowed for soaking it properly and there is a probability of its being too salt when served, it should be brought very softly to boil in a large quantity of water, which should in part be changed as soon as it becomes quite briny, for as much more that is ready boiling.

It is customary to lay rounds of beef, and other large joints, upon a fish-plate, or to throw some wooden skewers under them, to prevent their sticking to the vessel in which they are cooked; and it is as well to take the precaution, though unless they be placed over a very fierce fire, they cannot be in danger of this. The time allowed for them is about the same as for roasting, from fifteen to twenty minutes to the pound. For cooking rounds of beef, and other ponderous joints, a pan of this form is very convenient.

[Illustration:

Large Stock-pot.]

By means of two almost equally expensive preparations, called a _poêlée_, and a _blanc_, the insipidity which results from boiling meat or vegetables in water only may be removed, and the whiteness of either will be better preserved. Turkeys, fowls, sweetbreads, calf's brains, cauliflowers, and artichoke bottoms, are the articles for which the _poêlée_ and the _blanc_ are more especially used in expensive foreign cookery: the reader will judge by the following receipts how far they are admissible into that of the economist.

POÊLÉE.

Cut into large dice two pounds of lean veal, and two pounds of fat bacon cured without saltpetre, two large carrots, and two onions; to these add half a pound of fresh butter, put the whole into a stewpan, and stir it with a wooden spoon over a gentle fire until the veal is very white, and the bacon is partially melted; then pour to them three pints of clear boiling broth or water, throw in four cloves, a small bunch or two of thyme and parsley, a bay-leaf, and a few corns of white pepper; boil these gently for an hour and a half, then strain the _poêlée_ through a fine sieve, and set it by in a cool place. Use it instead of water for boiling the various articles we have already named: it will answer for several in succession, and will remain good for many days. Some cooks order a _pound_ of butter in addition to the bacon, and others substitute beef-suet in part for this last.

A BLANC.

Put into a stewpan one pound of fat bacon rasped, one pound of beef-suet cut small, and one pound of butter; the strained juice of two lemons, a couple of bay-leaves, three cloves, three carrots, and three onions divided into dice, and less than half a pint of water. Simmer these gently, keeping them often stirred, until the fat is well melted, and the water has evaporated; then pour in rather more than will be required for the dish which is to be cooked in the _blanc_; boil it softly until all the ingredients have given out their full flavour, skim it well, add salt if needed, and strain it off for use. A calf's head is often boiled in this.

ROASTING.

[Illustration:

Bottle Jack.[68]]

Footnote 68:

The bottle-jack is wound up like a watch, by means of a key, and turns very regularly until it has run down.

Roasting, which is quite the favourite mode of dressing meat in this country, and one in which the English are thought to excel, requires unremitting attention on the part of the cook rather than any great exertion of skill. Large kitchens are usually fitted with a smoke-jack, by means of which several spits if needful can be kept turning at the same time; but in small establishments, a roaster which allows of some economy in point of fuel is more commonly used. That shown in the print is of very advantageous construction in this respect, as a joint may be cooked in it with a comparatively small fire, the heat being strongly reflected from the screen upon the meat: in consequence of this, it should never be placed very close to the grate, as the surface of the joint would

then become dry and hard.

[Illustration:

Improved Spring Jack.]

A more convenient form of roaster, with a spit placed horizontally, and turned by means of a wheel and chain, of which the movement is regulated by a spring contained in a box at the top, is of the same economical order as the one above; but eaters of very delicate taste urge, as an objection to this apparatus, as well as to that shown above, that the meat cooked in either, derives from the tin by which it is closely surrounded, the flavour of _baked_ meat. The bottle-jack, with a common roasting-screen containing shelves for warming plates and dishes, and other purposes, is not liable to the same objection. To roast well with it (or with a smoke-jack), make up a fire proportioned in width and height to the joint which is to be roasted, and which it should surpass in dimensions every way, by two or three inches. Place some moderate-sized lumps of coal on the top; let it be free from smoke and ashes in front; and so compactly arranged that it will neither require to be disturbed, nor supplied with fresh fuel, for some considerable time after the meat is laid down. Spit or suspend the joint, and place it very far from the fire at first; keep it constantly basted, and when it is two parts done, move it nearer to the fire that it may be properly browned; but guard carefully against its being burned. A few minutes before it is taken from the spit, sprinkle a little fine salt over it, baste it thoroughly with its own dripping, or with butter, and dredge it with flour: as soon as the froth is well risen, dish, and serve the meat. Or, to avoid the necessity of the frothing which is often greatly objected to on account of the raw taste retained by the flour, dredge the roast liberally soon after it is first laid to the fire; the flour will then form a savoury incrustation upon it, and assist to prevent the escape of its juices. When meat or poultry is wrapped in buttered paper it must not be floured until this is removed, which should be fifteen or twenty minutes before either is served.

Baron Liebeg, whom we have already so often quoted, says, that roasting should be conducted on the same principle as boiling; and that sufficient heat should be applied to the surface of the meat at once, to contract the pores and prevent the escape of its juices; and that the remainder of the process should be _slow_. When a joint is first laid to the fire, therefore, it should be placed for twenty minutes or half an hour sufficiently near to effect this, without any part, and the fat especially, being allowed to acquire more than the slightest colour, and then drawn back and finished by the directions at the end of this section.

The speedy application of very hot basting-fat to every part of the meat, would probably be attended with the same result as subjecting it to the full action of the fire. It is certain that roasts which are constantly and carefully basted are always very superior to those which are neglected in this respect.

Remember always to draw back the dripping-pan when the fire has to be stirred, or when fresh coals are thrown on, that the cinders and ashes may not fall into it.

When meat is very lean, a slice of butter, or a small quantity of clarified dripping, should be melted in the pan to baste it with at first; though the use of the latter should be scrupulously avoided for poultry, or any delicate meats, as the flavour it imparts is to many persons peculiarly objectionable. Let the spit be kept bright and clean, and wipe it before the meat is put on; balance the joint well upon it, that it may turn steadily, and if needful secure it with screw-skewers. A cradle spit, which is so constructed that it contains the meat in a sort of framework, instead of passing through it, may be often very advantageously used instead of an ordinary one, as the perforation of the meat by this last must always occasion some escape of the juices; and it is, moreover, particularly to be objected to in roasting joints or poultry which have been boned and filled with forcemeat. The cradle spit (for which see “Turkey Boned and Forced,” Chapter XIV.) is much better suited to these, as well as to a sucking pig, sturgeon, salmon, and other large fish; but it is not very commonly to be found in our kitchens, many of which exhibit a singular scantiness of the conveniences which assist the labours of the cook.

For heavy and substantial joints, a quarter of an hour is generally allowed for every pound of meat; and with a sound fire and frequent basting, will be found sufficient when the process is conducted in the usual manner; but by the _slow method_, as we shall designate it, almost double the time will be required. Pork, veal, and lamb, should always be well roasted; but many eaters prefer mutton and beef rather underdressed, though some persons have a strong objection to the sight even of any meat that is not thoroughly cooked.

Joints which are thin in proportion to their weight, require less of the fire than thick and solid ones. Ribs of beef, for example, will be sooner ready to serve than an equal weight of the rump, round, or sirloin; and the neck or shoulder of mutton, or spare rib of pork,

than the leg.

When to preserve the succulence of the meat is more an object than to economise fuel, beef and mutton should be laid at twice the usual distance from the fire, after the surface has been thoroughly heated, as directed by Liebeg, and allowed to remain so until they are perfectly heated through; the roasting, so managed, will of course be _slow_; and from three hours and a half to four hours will be necessary to cook by this method a leg of mutton of ordinary size, for which two hours would amply suffice in a common way; but the flesh will be remarkably tender, and the flow of gravy from it most abundant. It should not be drawn near the fire until within the last half or three quarters of an hour, and should then be placed only so close as to brown it properly. No kind of roast indeed should at any time be allowed to take colour too quickly; it should be heated gradually, and kept at least at a moderate distance from the fire until it is nearly done, or the outside will be dry and hard, if not burned while the inside will be only half cooked.

STEAMING.

[Illustration:

Saucepan with Steamer.]

[Illustration]

The application of steam to culinary purposes is becoming very general in our kitchens at the present day, especially in those of large establishments, many of which are furnished with apparatus for its use, so admirably constructed and so complete, that the process may be conducted on an extensive scale with very slight trouble to the cook; and with the further advantage of being _at a distance from the fire_, the steam being conveyed by pipes to the vessels intended to receive it. Fish, butcher's meat, poultry, vegetables, puddings, maccaroni, and rice, are all subjected to its action, instead of being immersed in water, as in simple boiling: and the result is to many persons perfectly satisfactory; though, as there is a difference of opinion amongst first-rate cooks, with regard to the comparative merits of the two modes of dressing _meat_ and _fish_, a trial should be given to the steaming on a small scale, before any great expenses are incurred for it, which may be done easily with a common saucepan or boiler, fitted like the one shown above, with a simple tin steamer. Servants not accustomed to the use of these, should be warned against boiling in the vessel itself any thing of coarse or strong flavour, when the article steamed is of a delicate nature. The vapour from soup containing onions, for example, would have a very bad effect on a sweet pudding, and on many other dishes. Care and discretion, therefore, must be exercised on this point. By means of a kettle fixed over it, the steam of the boiler in the kitchen range may be made available for cooking, in the way shown by the engraving, which exhibits fish, potatoes, and their sauces, all in progress of steaming at the same time.[69] The limits of our work do not permit us to enter at much length upon this subject, but the reader who may wish to understand the nature of steam, and the various modes in which its agency may be applied to domestic purposes, will do well to consult Mr. Webster's excellent work,[70] of which we have more particularly spoken in another chapter. The quite inexperienced cook may require to be told, that any article of food which is to be cooked by steam in a saucepan of the form exhibited in the first of the engravings of this section, must be prepared exactly as for boiling, and laid into the sort of strainer affixed to the top of the saucepan; and that water, or some other kind of liquid, must be put into the saucepan itself, and kept boiling in it, the lid being first closely fixed into the steamer.

Securely closed with a band of paste passed round the edges, and pressed tightly over them. The lute or luting used for chemical apparatus is of a kind of clay.

STEWING.

[Illustration:

Hot Plate.]

This very wholesome, convenient, and _economical_ mode of cookery is by no means so well understood nor profited by in England as on the continent, where its advantages are fully appreciated. So very small a quantity of fuel is necessary to sustain the gentle degree of ebullition which it requires, that this alone would recommend it to the careful housekeeper; but if the process be skilfully conducted, meat softly stoved or stewed, in close-shutting, or luted[71] vessels, is in every respect equal, if not superior, to that which is roasted; but it must be _simmered_ only, and in the gentlest possible manner, or, instead of being tender, nutritious, and highly palatable, it will be dry, hard, and indigestible. The common cooking stoves in this country, as they have hitherto been constructed, have rendered the exact regulation of heat which stewing requires rather difficult; and the smoke and blaze of a large coal fire are very unfavourable to many other modes of cookery as well. The French have generally the advantage of the embers and ashes of the wood which is their ordinary fuel; and they have always, in addition, a stove of this construction, in which charcoal or _braise_ (for explanation of this word, see remarks on preserving, Chapter XXV.) only is burned; and upon which their stewpans can, when there is occasion, be left uncovered, without the danger of their contents being spoiled, which there generally is with us. It is true, that of late great improvements have been made in our own stoves; and the hot plates, or _hearths_ with which the kitchens of good houses are always furnished, are admirably adapted to the simmering system; but when the cook has not the convenience of one, the stewpans must be placed on trivets high _above_ the fire, and be constantly watched, and moved, as occasion may require, nearer to, or further from the flame.

[Illustration]

No copper vessels from which the inner tinning is in the slightest degree worn away should be used ever for this or for any other kind of cookery; or not health only, but life itself, may be endangered by them.[72] We have ourselves seen a dish of acid fruit which had been boiled without sugar in a copper pan from which the tin lining was half worn away, _coated with verdigris_ after it had become cold; and from the careless habits of the person who had prepared it, the chances were greatly in favour of its being served to a family afterwards, if it had not been accidentally discovered. Salt acts upon the copper in the same manner as acids: vegetables, too, from the portion of the latter which they contain, have the same injurious effect, and the greatest danger results from allowing preparations containing any of these to become cold (or cool) in the stewpan, in contact with the exposed part of the copper in the inside. Thick, well-tinned iron saucepans will answer for all the ordinary purposes of common English cookery, even for stewing, provided they have tightly-fitting lids to prevent the escape of the steam; but the copper ones are of more convenient form, and better adapted to a superior order of cookery.

Footnote 72:

Sugar, being an antidote to the poisonous effects of verdigris, should be plentifully taken, dissolved in water, so as to form a syrup, by persons who may unfortunately have partaken of any dish into which this dangerous ingredient has entered.

The enamelled stewpans and saucepans which have now very much superseded the old-fashioned metal ones for many purposes, are peculiarly suited, from the nicety of the composition with which they are lined, and which resembles earthenware, to the preparation of fine preserves, and all very delicate compounds, as well as to those of milk, and of various articles of diet adapted to invalids; and they possess the further advantage of being easily kept beautifully clean. Care should be taken not to allow anything which they may contain to burn to them, which it will quickly do if they be placed flat upon a fierce fire; and when this has once occurred, there will always be some difficulty in preventing their contents from adhering to them where they have been burned. They should always be filled with water immediately after being emptied, and will then merely require to be well washed and rinsed with more boiling water; but when they have been neglected, strong soda and water should be boiled in them for a few minutes.

BROILING.

[Illustration:

A Conjuror.]

Broiling is the best possible mode of cooking and of preserving the flavour of several kinds of fish, amongst which we may specify mackerel and whitings; it is also incomparably superior to frying for steaks and cutlets, especially of beef and mutton; and it is far better adapted also, to the preparation of food for invalids; but it should be carefully done, for if the heat be too fierce, the outside of the meat will be scorched and hardened so as to render it uneatable; and if, on the contrary, it be too gentle, the gravy will be drawn out, and yet the flesh will remain so entirely without firmness, as to be unpleasant eating. A brisk fire, _perfectly free from smoke_,

a very clean gridiron, tender meat, a dish and plates as hot as they can be, and great despatch in sending it to table when done, all are essential to the serving of a good broil. The gridiron should be heated, and rubbed with mutton suet before the meat is laid on, and it should be placed slopingly over the fire, that the fat may run off to the back of the grate, instead of falling on the live coals and smoking the meat; if this precaution should not prevent its making an occasional blaze, lift the gridiron quickly beyond the reach of the smoke, and hold it away until the fire is clear again. Steaks and chops should be turned often, that the juices may be kept in, and that they may be equally done in every part. If, for this purpose, it should be necessary for want of steak-tongs to use a fork, it should be passed through the outer skin or fat of the steak, but never stuck into the lean, as by that means much of the gravy will escape. Most eaters prefer broiled beef or mutton, rather underdressed; but lamb or pork cutlets should always be thoroughly cooked. When a fowl or any other bird is cut asunder before it is broiled, the inside should first be laid to the fire: this should be done with kidneys also. Fish is less dry and of better flavour, as well as less liable to be smoked, if it be wrapped in a thickly buttered sheet of writing paper before it is placed on the gridiron. For the more delicate-skinned kinds, the bars should be rubbed with chalk instead of suet when the paper is omitted. Cutlets, or meats of any other form, when egged and crumbed for broiling, should afterwards be dipped into clarified butter or sprinkled with it plentifully, as the egg-yolk and bread will otherwise form too dry a crust upon it. French cooks season their cutlets both with salt and pepper, and brush a little oil or butter over them to keep them moist; but unless this be done, no seasoning of salt should be given them until they are just ready to be dished: the French method is a very good one. Steaks or cutlets may be quickly cooked with a sheet or two of lighted paper only, in the apparatus shown in the preceding page, and called a conjuror. Lift off the cover and lay in the meat properly seasoned, with a small slice of butter under it, and insert the lighted paper in the aperture shown in the plate; in from eight to ten minutes the meat will be done, and found to be remarkably tender, and very palatable: it must be turned and moved occasionally during the process. This is an especially convenient mode of cooking for persons whose hours of dining are rendered uncertain by the nature of their avocations. For medical men engaged in extensive country practice it has often proved so; and we would especially recommend it to the notice of emigrants, to whom it would often prove invaluable. The part in which the meat is placed is of block tin, and fits closely into the stand, which is of sheet iron. The conjuror from which our design was drawn, was purchased in a country town in Essex, and was exceedingly well made, and very cheap. We find on inquiry that the maker has quitted the place, or we would insert his address.

FRYING.

[Illustration:

Sauté Pan.]

This is an operation, which, though apparently very simple, requires to be more carefully and skilfully conducted than it commonly is. Its success depends principally on allowing the fat to attain the exact degree of heat which shall give firmness, without too quick browning or scorching, before anything is laid into the pan; for, if this be neglected, the article fried will be saturated with fat, and remain pale and flaccid. When the requisite degree of colour is acquired before the cooking is complete, the pan should be placed high above the fire, that it may be continued slowly to the proper point. Steaks and cutlets should be seasoned with salt and pepper and dredged on both sides lightly with flour before they are laid into the pan, in which they should be often moved and turned that they may be equally done, and that they may not stick nor burn to it. From ten to fifteen minutes will fry them. They should be evenly sliced, about the same thickness as for broiling, and neatly trimmed and divided in the first instance. Lift them into a hot dish when done; pour the fat from the pan, and throw in a small slice of butter; stir to this a large teaspoonful of flour, brown it gently, and pour in by degrees a quarter of a pint of hot broth or water; shake the pan well round, add pepper, salt, and a little good catsup, or any other store sauce which may be preferred to it, and pour the gravy over the steaks: this is the most common mode of saucing and serving them.

Minute directions for fish, vegetables, omlets, and different preparations of batter, are given in their proper places; but we must again observe, that a very small frying pan (scarcely larger than a dinner-plate) is necessary for many of these; and, indeed, the large and _thick_ one suited to meat and fish, and used commonly for them is altogether unfit for nicer purposes.

The _sauté-pan_, shown in the preceding page, is much used by French cooks instead of a frying-pan; it is more particularly convenient for tossing quickly over the fire small collops, or aught else which requires but little cooking.

All fried dishes, which are not sauced, should be served extremely dry upon a neatly-folded damask cloth: they are best drained upon a sieve reversed placed before the fire.

[Illustration:

Wire Basket for Frying.]

A wire basket of this form is convenient for frying parsley and other herbs. It must be placed in a pan well filled with fat, and lifted out quickly when the herbs are done: they may likewise be crisped in it over a clear fire, without any fat.

[Illustration:

Wire Lining of Frying-pan.]

[Illustration:

Modern Sauté Pan.]

The frying-pans fitted with wire linings that lift in and out of them, which have lately come much into use in good kitchens, are so excellently adapted to save trouble, and so convenient for preparing delicately light patties, _croquettes_, _rissoles_, and other dishes of a similar nature, that no cook who is expected to serve them in the best manner should be without one. They should all be arranged upon this wire lining, and plunged together into the boiling fat; and well drained on it when they are lifted out.

BAKING, OR OVEN COOKERY.

[Illustration:

Nottingham Jar.]

The improved construction of the ovens connected with all modern cooking stoves, gives great facility at the present day for _home baking_, even in very small establishments; and without this convenience it is impossible for justice to be done to the person who conducts the cookery; as many and great disadvantages attend the sending to a public oven; and it is very discouraging to a servant who has prepared her dishes with nicety and skill, to have them injured by the negligence of other persons. One of the best modes of cooking with which we are acquainted is by means of a jar, resembling in form that shown above, well pasted down, and covered with a fold of thick paper, and then placed in a gentle oven. Rice is most excellent when thus slowly baked with a certain proportion of liquid, either by itself, or mingled with meat, fish, or fruit; but we must reserve for another volume particulars of this little system of _slow oven-cookery_, in which for some years past we have had numberless experiments made with almost uniform success: it is especially suited to invalids, from preserving the _entire_ amount of nourishment contained in the articles of food dressed by it; and it is to their use that we hope to appropriate it.

[Illustration:

American Oven.[73]]

Footnote 73:

We have scarcely done justice in the former editions of this work to these very useful little ovens, which we have found, after long trial, better adapted to some purposes than brick or iron ones, because preparations which require it, (those of Indian corn, for example) can be heated in them more gradually; and when once the management of them is understood, they will answer admirably for delicate sweet puddings, and for cakes, with the advantage of requiring but a very moderate fire.

The oven may be used with advantage for many purposes for which it is not commonly put into requisition. Calves' feet, covered with a proper proportion of water, may be reduced to a strong jelly if left in it for some hours; the half-head, boned and rolled, will be found excellent eating, if laid, with the bones, into a deep pan and baked quite tender in sufficient broth or water, to keep it covered in every part until done; good soup also may be made in the same way, the usual ingredients being at once added to the meat, with the exception of the vegetables, which will not become tender if put into cold liquid, and should therefore be thrown in after it begins to simmer. Baking is likewise one of the best modes of dressing various kinds of fish: pike and red mullet amongst others. Salmon cut into thick slices, freed from the skin, well seasoned with spice, mixed with salt (and with minced herbs, at pleasure), then arranged evenly in a dish, and covered thickly with crumbs of bread, moistened with clarified butter, as directed in Chapter II., for baked soles, and placed in the oven for about half an hour, will be found very rich and highly flavoured. Part of the middle of the salmon left entire, well cleaned, and thoroughly dried, then seasoned, and securely wrapped in two or three folds of thickly buttered paper, will also prove excellent eating, if gently baked. (This may likewise be roasted in a Dutch oven, either folded in the paper, or left without it, and basted with butter.) Hams, when freshly cured, and not over salted, if neatly trimmed, and covered with a coarse

paste, are both more juicy, and of finer flavour baked than boiled. Savoury or pickled beef too, put into a deep pan with a little gravy, and plenty of butter or chopped suet on the top, to prevent the outside from becoming dry; then covered with paste, or with several folds of thick paper, and set into a moderate oven for four or five hours, or even longer, if it be of large weight, is an excellent dish. A goose, a leg of pork, and a sucking pig, if properly attended to while in the oven, are said to be nearly, or quite as good as if roasted; but baking is both an unpalatable and an unprofitable mode of cooking joints of meat in general, though its great convenience to many persons who have but few other facilities for obtaining the luxury of a hot dinner renders it a very common one. It is usual to raise meat from the dish in which it is sent to the oven by placing it, properly skewered, on a stand, so as to allow potatoes or a batter pudding to be baked under it. A few button onions, freed from the outer skin, or three or four large ones, cut in halves, are sometimes put beneath a shoulder of mutton. Two sheets of paper spread separately with a thick layer of butter, clarified marrow, or any other fat, and fastened securely over the outside of a joint, will prevent its being too much dried by the fierce heat of the oven. A few spoonsful of water or gravy should be poured into the dish with potatoes, and a little salt sprinkled over them. A celebrated French cook recommends _braising in the oven_; that is to say, after the meat has been arranged in the usual manner, and just brought to boil over the fire, that the braising pan, closely stopped, should be put into a moderate oven, for the same length of time as would be required to stew the meat perfectly tender.

BRAISING.

[Illustration:

English Braising-pan.]

Braising is but a more expensive mode of stewing meat. The following French recipe will explain the process. We would observe, however, that the layers of beef or veal, in which the joint to be braised is imbedded, can afterwards be converted into excellent soup, gravy, or glaze; and that there need, in consequence, be no waste nor any unreasonable degree of expense attending it; but it is a troublesome process, and quite as good a result may be obtained by simmering the meat in very strong gravy. Should the flavour of the bacon be considered an advantage, slices of it can be laid over the article braised, and secured to it with a fillet of tape.
